The style of hand-bouquet in vogue this winter, is loose and large. From four to five dozen Roses are bunched together, with Adiantum gracilimum or Asparagus plumosus for foliage and fringing. The small compact bouquet with a Camellia in the centre, and edged with brakes, such as was made a decade ago, would be ridiculed at this time, when only a quantity of rich Roses and rare foliage gives satisfaction for either carrying in the hand or wearing in the belt. What is known by florists as the French corsage bouquet is fashionable for wearing to the opera, where a lavish display is made. The bunch is made of Rosebuds or Carnations. It begins with Bon Silene buds at the shoulder, and gradually expands from one to twelve flowers: when made in pink, Mermets follow Bon Silene then La France, and at the waist come the hybrids Anne de Diesbach, and Magna Charta; when made in white, Niphotos, Cornelia Cook and Maréchal Robert Roses are used, in combination with the dainty Lily of the Valley and delicate Narcissus. The English style of decorating with plants grows in favor every year. Only specimen

plants can be used for this purpose where they receive close scrutiny, and for this reason great improvement in plants both large and small is noticed in the extensive chains of green-houses built in suburban places. The most delightful effects are made with Palms, Tree Ferns, and exquisite foliage plants of many varieties.

WEDDING RECEPTIONS.

A large mansion on Fifth avenue, was recently decorated for a wedding. The cor-

Bermuda Lilies, which have been brought in unusually early this season, were used admirably in the adornment of the drawing-room. Smilax was mossed in arches over the doors, and in it were plunged these graceful Lilies. At the end of the room where the bride stood, a veil of Lily of the Valley was looped. It is estimated that the sprays of Lily in this veil cost \$800. It was edged with La France Roses. In the grates were delicate ferns and blooming plants of

Poinsettia. The mantel-piece arrangement was highly effective. There were vases of La France and Duke of Connaught Roses at each end. Passion flower vines were brought from these in festoons to a plaque of Lilies at the center of the mantel mirror frame. The chandeliers were decorated with Butterfly Orchids which seemed to dance about the light.

The bride wore Lily of the Valley, and carried a large bunch of it. Her bridesmaids wore silk tulle over white glacé silk; there were six of them. Their only ornaments were necklaces and bracelets of Asparagus plumosus.

COMPLIMENTS OF THE SEASON.

It is the custom this year for ladies to send flowers to one another, and to leave a nosegay when they pay visits. Several very lovely floral gifts have been sent to new babies the day after their birth. A tiny pair of white silk socks were caught with a stitch together. In one was placed Lily of the Valley; in another Forget-me-nots, among which was a Moss Rose bud. An embroidered blanket was sent to another little stranger, filled with Daisies. Straw cradles, filled with spring flowers are favorite gifts for new comers. It would seem that every sentiment may be expressed with flowers and the fact is

taken advantage of by many people in a pleasant and praiseworthy manner.

Various elaborate designs have been made for private orders. The English Holly and Mistletoe has been sold to eager purchasers. The former cost from 25 cents to \$5 a bunch. Boughs of the latter, brought from 50 cents to \$10 according to size. Prince's Pine is preferred for roping, as it holds its needles better than other evergreens. FLORA.

TYPES OF RANUNCULUS AND ANEMONES.

ridor looked like a Fern lane, as it had Tree Ferns in tubs placed in every eligible position. Plaques of growing Ferns were hung on the walls, over the doors and at the top of the mirror. On the newel was a large specimen Adiantum Farleyense. The mirror was garlanded with Lygodium scandens, and the stairway with Smilax chains. At one end of the corridor was an alcove for musiciens, behind a high Ivy screen.

Lawn and Landscape.

FLOWER BEDS IN LAWNS.

To those who grow a miscellaneous collection of flowers for the satisfaction of watching their growth and peculiarities of transplanting and putting and weeding, any rules or suggestions are superfluous. The more unique, miscellaneous or odd such collections appear to the educated gardener, the more precious they are often to their owners, and as long as they give satisfaction to their owners; familiarize them with plant growth, and take them out of the tread mill round of every day life, it is really no ones business where one locates them or whether they are exactly in accordance with rule of thumb or not.

There is, however, as the country becomes more densely settled, and the towns spread out, a growing desire for harmony of surroundings and any rules that can be given toward making the flower bed a part of a harmonious whole will be welcomed by many. As in other matters of taste the fitness of things is always a true guide, and the question whether the varieties planted best fulfill the object wished for, is to decide the matter in this case.

For example, the larger Dahlias, Zinnias, Sunflowers, Double Hollyhock, Double Poppy, Peony and Tiger Lilies are attractive and showy at a distance, or on the borders of a shrubbery while they have little to recommend them for planting close to the house or near a much used walk. Even the beautiful Japan Lilies are unsuitable as lawn plants and Gladiolus and Tuberoses equally so. Their proper place is in separate beds—in the vegetable garden if no other ground is available—to be cut for the parlor and hall for which purpose their long keeping qualities make them specially adapted. For small lawns kept closely shaven nothing is better than small beds containing a few choice Verbenas, or a bed of Portulacas or small and tasteful designs in Alternantheras or the trailing Dusty Miller.

Perhaps some one will ask what a tasteful design would be like, which question I cannot answer better than by giving an illustration or two:

In front of a church in a neighboring city are two grass plats ten feet square. In each of these plats is planted every summer a Scarlet Geranium bed bordered with Centaurea. These beds are nine feet in diameter and the grass around them bears about the same proportion that the corners of a square clock-face bears to the dial. How much prettier and more in harmony with the surroundings would be two Greek crosses not more than three feet long, and consisting of two shades of Alternanthera, than these monstrous beds appropriate only for extensive lawns.

Two or three times a week in summer, I pass a city residence where to the left of the path as one enters, is supposed to be a square rod of lawn; out of this grass plat is cut a huge five-pointed star planted with Coleus. So anxious is the owner to make this star as large as possible, that there is hardly room enough left to pass between its points and the fence. Now such a star in the center of a circular carriage turn a hun-

dred feet in diameter might be tolerable, and there are other conditions under which it could be made an object of beauty, but as an ornament to a square rod of city lawn it is simply absurd.

During a short stay at Philadelphia I visited Girard College, and walking through the front lawn I noticed as its leading feature a great number of highly colored beds of regular but diverse patterns composed of Coleus, Alternantheras and other bright plants. The eye became soon wearied of these numerous monotonous beds and I naturally questioned the taste displayed. But when after passing through the building I had reached the wonderful roof, shingled with marble slabs five inches thick, and when after gazing awhile at the outspread city of Brotherly Love my eye fell upon the lawn below, then the exquisite work and skill of the gardener became apparent. Like in a picture the individuality of the plant melted in the perspective. The effect was indescribably grand, neither the choicest mosaic table nor the costliest carpet could be more beautiful.

The arrangement of flower beds in lawns with regard to their principal point of view deserves the careful study of the landscape gardener and will be reserved for another article.

L. B. PIERCE.

TRANSPLANTING TREES IN WINTER.

As a rule there is not much gained by planting large trees, smaller ones, well taken care of, give generally better satisfaction. Yet there are cases in which it becomes desirable to plant as large trees as is practicable, even if it has to be done at considerable expense and labor. To those so circumstanced the following directions by a correspondent of the *Dutchess Farmer*, may be of interest:

When properly done, the holes should, of course, be dug when the ground is not frozen, and the soil placed in a compact heap, and covered on the south of the hillock with some coarse litter from the horse stable, to keep a portion of the soil from freezing, which will give the planter access at any time during the winter. Sufficient loose soil to pack about the ball of earth will be taken up with the tree, which will be nearly sufficient of itself to fill the receptacle, and the dressing will be just where wanted to spread about the tree for winter protection, and for immediate nourishment in the spring. Experience has taught me that it is highly needful to furnish some fertilizer for all transplanted trees at the time of removal. In balling out trees, it is not advisable to wait until the ground is frozen hard, as is often done, which greatly increases the labor and expense.

It is only necessary to dig a narrow trench about the tree, which may be quite near the trunk; the soil being damp will be held by the many fibrous roots from falling into the trench, which should be deep enough for cutting down through the horizontal roots, which, with most trees, will require a depth of from fifteen to twenty inches, laying bare the top roots. Having dug about all the trees in like manner, all you have to do is to wait until the ball of earth is frozen, when you have only to chop off the main perpendicular root, and, with the trunk for a lever, two men can readily load upon a stonebat or sleigh, a tree, with ball of earth attached,

as heavy as a team can haul. When arrived at the place of setting, drive the boat or sleigh upon the heap of soil in such a manner that it will incline toward the pit, and in a moment you may slide the tree to its appointed place.

Tramp some of the soil from under the dressing around the ball of earth; put the litter about it, and the work is done much better than it could be at any other season of the year, for the multitude of fibrous roots in the ball of earth, preserve the tree from any check until the larger roots can throw out a colony from the points where they were cut off. There is no necessity of losing one tree in a hundred by this method, while a large tree can be removed with as much safety as a small one, providing the ball of earth attached be correspondingly enlarged. This method is exceedingly favorable for the resetting of large evergreen trees, which otherwise is attended with much danger of loss from the least drying of the roots. It is a work well adapted to the winter, as it can readily be discontinued at an inclement season, to be resumed at any favorable moment.

WINTER COLORING.

By a proper use of the means at our command, we may have color in the garden all winter, and any one knows the pleasing effect a slight amount of warm coloring gives when seen in a winter landscape, these tones are always low. The Bittersweet, a native climber, has clusters of orange and scarlet fruit, which when seen against a background of evergreens has all the beauty of flowers. Our native Sumach can be used most effectively in combination with evergreens, its large crimson clusters contrasting vividly, and brightening the scene. Evergreens are sombre when used alone, but a point of warmer color seems to enliven them, as a scarlet flower worn with a black dress makes it almost brilliant.

We have several native shrubs bearing showy scarlet berries, and every one of these can be grown in the lawn or shrubbery if proper care is taken in transplanting them. Of course, the more nearly you imitate their surroundings, and their conditions of growth in their native haunts, the greater the success. Study the plant and its habitat, and when you remove it make the change as slight as possible. If it loves fibrous soil, rich in leaf-mold and decomposing woody matter, bring some along to put about its roots. If it seems fond of shade, do not plant it in unshaded places.

Those who are not so fortunate as to be able to get these plants from field, wood and swamp, can procure many varieties of desirable native shrubs of nurserymen, who are beginning to recognize the beauty and worth of our own plants. We have native shrubs and flowers quite as beautiful as those we have paid high prices for, from foreign lands, but we have neglected them shamefully. If some of them had been advertised as coming from Japan, and sold at \$1 to \$5 a piece, everybody who grows flowers would have been ready to purchase. Never despise beauty because it is to be had cheaply.—E. E. Regford in *Our Country Home*.

If you see any way in which THE AMERICAN GARDEN can be made more interesting to you, please let us know how.

Foreign Gardening.

ORCHIDS IN PARA.

(Continued from our last number.)

Leaving the house, we found the Orange-trees along the path hung with Orchids, all growing on blocks and long bars extending from tree to tree, hung thick with vigorous plants. There seemed to be no attempt at classification by position; Cattleyas, Stanhopeas, Laelias, Brassias, Oncidiums, and other Orchids of the Western Hemisphere mingled promiscuously with Vandas and Dendrobiums from the Eastern. But each plant, except those which were in large numbers and easily distinguished, such as *Cattleyas El Dorado* and *superba*, *Oncidium Lanceanum*, *Schomburgkia undulata*, and others, has a numbered leaden label attached. The numbers refer to a book in which is written the whole history of each plant. The numbers of the species already reach nearly four hundred and fifty, and constant additions are being made.

A mass of about forty plants of *Miltonias spectabilis*, *candida*, *cuneata*, and *Clowesii*, mostly showing bloom, attracted our attention by their vigorous growth and healthy green foliage. Not a plant showed the yellow shade of leaf which is so general in *Miltonias*. The fence on our right was hidden by masses of *Cattleya El Dorado*, and we noticed many good plants of *Laelia Perrinii*, while the Orange-trees near the wicket-gate were draped with the pendulous stems of *Dendrobium superbum* and *Picardii*.

Close to the gate were two large tubs of a very stately Orchid, *Epidendrum paniculatum*, the stems five feet tall, and just showing bud. Entering the wicket, we found the fence on both sides, to the end of the orchard, a mass of Orchids, and on poles reaching from tree to tree were baskets containing the rarer species, among which we noticed in fine growth *Cattleyas marginata*, *pumila* and *Skinneri*, *Laelia Dayana*, *Leptotes bicolor* and *Dendrobiums chrysanthum*, *Wardianum*, *macrophyllum giganteum*, *crepidatum* and *pulchellum*, but only *chrysanthum* was in bloom. Some large tubs contained plants of *Cryptopodium punctatum* and *Andersoni*, and there was a specimen *Galeandra Devoniana*, which to see was worth our walk. The stems were as thick as one's thumb, six feet high, and bent with the weight of great panicles of bloom; we counted twenty-five on a single stem, each flower two inches in diameter by actual measurement.

A large Abio tree was hung with *Scuticaria Steelii* and various rush-leaved *Brasavolas*, and all the posts which support the covered tables of foliage plants were likewise hung with Orchids. One of the loveliest of Orchids, of which we saw fine plants, is *Ionopsis paniculata*, which spreads a rosy cloud of blossom, the panicle of flowers often larger than the whole plant. Away from the shelter of the trees were some tables of Orchids in pans, among which were fine specimens of *Cattleyas lobata*, *Dowiana*, *Leopoldi*, *Mendeli bicolor*, *labiata intermedia*, some good *Vandas*, *Erides* and *Saccolabiums*, and very vigorous *Calanthes* and *Phajus*.

On some of the trees were large masses of *Camaridium ochroleucum*, a very pretty,

white-flowered, fragrant Orchid, and of *Rodriguezia scemda*. Hardly distinguishable from the latter in foliage were fine plants of *Burlingtonia fragrans*, the best of the family, which were just showing bloom. Some large plants of *Dendrobium Dalhousianum*, seen by their strong growth and signs of former flower to have taken mildly to the climate, and a long line of *Vandas* and *Saccolabiums* in baskets were throwing out roots into the air in every direction.

The collection is very weak in *Cypripedia*, of which we only saw *C. longifolium*, *Rozli*, and *Spicerianum*, the latter a new arrival. Of *Chysis*, *Stanhopeas*, and *Coelogynes* there were plenty; but *Angraecums*, *Odontoglossums*, and *Masdevallias* were almost wholly wanting, the two latter because the climate is too hot for them. For the same reason Senhor Olinda has lost all his *Cattleya citrina*, *Laelia majalis*, and *Lycaste Skinnerii*, and for some inexplicable reason *Dendrobium nobile*, and *Cattleya Mossiae*, of which there are many plants, do not thrive.

The Phalaenopses, though few in species and number, were in wonderful health. The best was *P. Schilleriana*, the foliage as large as one's hand, very richly marked, and carrying a spike of bloom four feet long. Of choice little plants there were many, such as *Promeneas*, four species of *Sophranitis*, *Oncidium articulatum*, and *Liminghei dasystyle* and *uniflorum*, *Leptotes*, *Paphineas*, and *Aganisia*.

Zygopetalums were represented by *rostratum* and *maxillare* in many varieties, and by the larger growing *Maekayi*, and there were a host of *Epidendrums*, chiefly valuable for the profusion and fragrance of flower rather than for color.

Time fails us to give a description of all that we saw; in so large a collection something new is developing every day, and thus the attractions are ever new.

As to the care required we may say, as when describing the foliage plants, it is reduced to a minimum. For nine months in the year no watering is necessary, and a good syringing in the morning suffices to keep the plants in good health the other three. The great care is the potting, basketing, or blocking of the plants; when they are once hung up the kindly climate does the rest. Of course, there are annoyances; slugs and grasshoppers sometimes do mischief. We saw a long stalk of *Dendrobium* from which every bud had been stripped the previous night, and Senhor Olinda was lamenting a choice plant of *Neottia orchioides*, which a grasshopper had eaten completely off.

But the annoyances are small, compared with the pleasure, and we are fully convinced that Para offers every attraction to the amateur in Orchids.

PARA, Brazil.

E. S. RAND.

A WONDERFUL ISLAND.

NEVER THE SIGHT OF A PLOWED FIELD NOR
THE SOUND OF A BROOK.

It is curious to think that, in the country where vegetation never dies and everything is perpetually green, the people have never seen a field of grain or a hay-stack; have never watched the earth turned over and under by a plow; never heard the click of a harvester or the hum of a brook, or watched the flow of a river. These things are un-

known in Nassau, says a correspondent of the *N. Y. Times*. No grain is raised there; there is no field big enough to make it worth while for one thing, and where the land has been cleared and broken and made productive it is too rich in its capacity to raise more valuable things. There is very little grass. Here and there are little patches of it, but almost always where it has been sown and carefully cultivated. All the flour used has to be imported. As most of the horses come from America, so their hay and feed is taken from here, too, except such green stuff as they pick up incidentally. Our modern farm machines being unnecessary there, are unknown and unheard of.

There are no rivers, and in traveling over almost all parts of the island of New Providence I do not remember to have seen even the smallest brooklet. But it is anything but barren, anything but desolate. Take a field there that is nothing but a solid mass of coral rock and limestone, and, if let alone for a year or two, it becomes so covered with all sorts of vegetation that no man could tell whether the bottom of it was sand, or clay, or rock, or what. If land is not carefully cultivated all the time, it soon disappears beneath the growth of trees and bushes. A barren rock in less than two years becomes a flower garden, if let alone. It is a common saying that the land has to be tilled with a pickaxe, and trees and vegetables set out with crowbars. There is good clay soil on some parts of the island. Some of the Pine-apple fields were of rich red clay, strong enough to raise grain or anything planted in them. But they were exceptions. Only here and there this red clay is found, and all the rest is rock.

THE GARDEN OF EDEN.

"Gan-Edan,—an inclosed garden, from the Greek 'gan,' to protect or defend, and 'eden' or eden, pleasure or delight,—or Paradise, is," says Loudon, "supposed by some to have been situated in Persia; by others Armenia; and by others Chaldea, on the north of the Persian Gulf, near the present Bassorah, the Euphrates dividing there into four streams, in the manner mentioned in holy writ. Bellingham tells us that the people of Damascus believe implicitly that the site of Paradise was at El Mezey, near that city, now a favorite place of recreation of the Turks. The waters of the Tege and Barrady, which supply numerous fountains of Damascus, divide there into four streams, and these they suppose to be the four rivers of Moses.

The inhabitants of Ceylon say that Paradise was placed in their country; and, according to the Rev. Dr. Buchanan, they still point out Adam's bridge and Abel's tomb. Sir Alexander Johnston informs us that they also point out, as the tree which bore the forbidden fruit, the *Divi Saduer*, or *Taberna-montana alternifolia* of botanists. For confirmation of this tradition, they refer to the beauty of the fruit and the fine scent of the flowers, both of which are most tempting. The shape of the fruit gives the idea of a piece having been bitten off; and the inhabitants say that it was excellent before Eve ate of it, though it is now poisonous. Many other fanciful opinions have been given respecting the site of Paradise, and a Swedish professor in the seventeenth century wrote a book to prove it was in Sweden.

Exhibitions and Societies.

WESTERN NEW YORK HORTICULTURAL SOCIETY.

The Thirtieth Annual Meeting of this Society, of which P. Barry is President, and P. C. Reynolds, Secretary, will be held in the Common Council Chamber, in the city of Rochester, commencing January 28th, at 11 o'clock, a. m. Farmers, Fruit Growers, Nurserymen, Gardeners, all who are interested in horticultural progress are cordially invited to attend, and will be free to participate in the discussions. Delegates from sister societies in this and other states are invited, and will be cordially welcomed.

The proceedings will, as usual, embrace reports of standing committees, county committees, discussions on a great variety of subjects, including the leading horticultural topics of the day, besides practical and scientific papers by John J. Thomas, Prof. G. C. Caldwell, Dr. J. A. Lintner, Dr. E. Lewis Sturtevant, Daniel Batchelor, David Wing, Simeon G. Curtice, and other gentlemen of great experience.

Contributions of new or fine specimens of fruits, flowers or vegetables, new implements or other objects of special horticultural interest are solicited for exhibition. The hall will be open at 10 o'clock to receive them. Articles from a distance may be sent by express to the Secretary.

The annual fee of membership is one dollar; life membership ten dollars. Those who cannot attend may remit to the treasurer.

The proceedings are published annually, immediately after the meeting, and furnished free to all members.

MICHIGAN STATE HORTICULTURAL SOCIETY.

The report of the Annual Fair of this society, like everything from the pen of the society's genial and accomplished secretary, Mr. Chas. W. Garfield, is full of interest, and gives many valuable hints to those in charge of horticultural exhibitions. Experience without deductions and conclusions is of no value, and benefits no one, and this is one of the reasons why so many of our horticultural and agricultural exhibitions do so little good. Secretary Garfield, in order to make each fair better than the preceding one, sums up the lessons of the past fair as follows:

1. Tables are infinitely superior to shelving upon which to show fruits.

2. A clasp in which to hold the name card well above the fruit is a great help to observers.

3. Either the fairs should be held longer, so that people will not come in so large numbers upon a single day, or accommodations for a large crowd to see and study the displays without hindering others should be given.

4. Exhibitors of collections should have their fruit so packed and lists so made out that their exhibits can be put in shape in at most half a day after reaching the ground.

5. Every possible convenience should be given committees for rapid and systematic work, and the securing of a tasty exhibit with these conveniences is a problem well worth the study of fair managers.

6. Exhibitors should have made such a study of the premium list as to know exactly their places of entry and procedure before they reach the ground.

7. All unworthy varieties should be rejected, unless they are shown for the purpose of educating people as to what they do not want, which fact should be made conspicuous to observers and committees.

8. Committees cannot afford to make awards without placing upon record the argument which led to their decision; the same to be printed with the list of awards.

9. A place in the hall should be devoted to those seeking names of fruits where all such can be placed under proper supervision, and the committee on nomenclature give the desired information on cards made for this especial purpose.

10. More attention should be given to the securing of exhibits by amateur growers of plants and flowers.

NEW YORK HORTICULTURAL SOCIETY.

The December exhibition of this society was held on the 3d of the month at Horticultural Hall, No. 26 and 28 West 28th street.

Chrysanthemums formed again the leading feature, Hallock & Thorpe's plants and cut flowers covering one of the large tables running through the entire hall, and Peter Henderson's another. The first premium was awarded to Hallock & Thorpe, but Peter Henderson's exhibit was so equal to theirs in excellence that, if in their power, the judges should have given a first prize to both of them.

Wm. K. Harris of Philadelphia, exhibited a large collection of Chrysanthemums imported directly from Japan, some of which were exceedingly beautiful; a single flower measured seven inches in diameter. The amateur prize was awarded to John Farrel.

John Henderson's collection of Roses attracted deserved attention. It comprised all the leading varieties of the season prominent among them the beautiful Madam Cusin.

The special prize for the Sunset Rose was awarded to W. K. Harris.

Chas. E. Parnell's collection of cut-flowers was much admired, as it contained many beautiful older plants seldom seen among florist's flowers.

J. T. Lovett exhibited an interesting collection of Japan Persimmons.

Bird's new Mignonette, a bunch of which was shown, has immense flower spikes, the largest we have ever seen.

In addition to these there were Geraniums, Carnations, Pansies and, in fact, representatives of all the leading flowers of the season, making the hall as bright and fragrant as a spring morning.

AMERICAN INSTITUTE FARMERS' CLUB.

This time-honored club, which was one of the first agricultural organizations in the United States, and which for many years exerted a powerful influence on our agricultural development, will probably be remembered by many of our readers. For some years past but few practical men took any interest in its meetings, which in consequence dwindled into insignificance. Recently however, the most active former members together with a number of other progressive agriculturists reorganized the club under the presidency of Dr. F. M. Hexamer, and Mr. D. R. Garden as Secretary.

The first meeting under the new management, held on December 9th, was well attended, every seat in the large room being occupied, showing how heartily the public

is in sympathy with this movement. New York, the metropolis of our continent, and the center of our agricultural commerce seems to be pre-eminently the place for a representative organization of this kind, and nowhere else is it more important that the various relations between the producer and the consumer be properly understood than here. It is also proposed to devote a considerable share of attention to market gardening, pomology, floriculture, rural life, and all branches of horticulture.

The Sheep industry in the vicinity of New York, the principal subject for the day, was introduced by Mr. James Wood of Mount Kisco, Westchester County, N. Y. In an excellent address the speaker explained the advantages of sheep raising over dairying and other farming specialties, within a distance of from fifty to a hundred miles from this city. He then stated the results of his own extensive experience in the management of sheep and the comparative value of the leading breeds. The address was listened to with great interest, and Mr. Wood obligingly answered the many questions put to him by persons in the audience.

To give additional attraction to these meetings, it is also proposed to invite exhibits of agricultural and horticultural products of special merit. As a beginning, the editors of the *Rural New Yorker* placed on the table several monster potatoes, which were probably the largest perfect-shaped specimens of which there is any record. One of them, an Early Victor, weighed four pounds and a half, and another, a Rose Potato, was of nearly the same weight. Mr. J. T. Lovett of Little Silver, N. J., exhibited a highly interesting collection of several varieties of Japanese Persimmons. A tree growing in a tub, not over three feet high, was loaded with brilliant fruits, and presented an attractive appearance. Several varieties of Apples and various seasonable flowers were on the table.

The second meeting was held on December 23d. Mr. E. Williams delivered a most instructive address on Pruning Grape-vines, of which we shall speak in a future number. Among the speakers announced for the coming meetings, are: A. S. Fuller, P. T. Quinn, Maj. H. E. Alvord, Gen. Marey, J. S. Woodward, Dr. B. D. Halsted, Col. M. C. Weld, J. T. Lovett, J. H. Hale, J. B. Rogers, P. B. Mead and others.

Regular meetings are held the second and fourth Tuesdays of each month at 1:30 p. m., in room 24, Cooper Union, New York. All persons interested in Agriculture and Horticulture, ladies as well as gentlemen, are invited to attend.

THE NEW ORLEANS EXHIBITION.

The great Exposition now in progress at New Orleans bids fair to be a memorable event in horticulture, and to be of high value for the advancement of southern and southwestern pomology and gardening, which we believe are to be the chief industries of those sections in the near future. Appreciating this fact, we have arranged with that veteran horticulturist, Mr. E. Williams of Montclair, N. J., to represent THE AMERICAN GARDEN during the continuance of the Exposition, knowing that he possesses the respect and will receive the merited consideration and co-operation of all horticulturists he may eluce to meet in the great Queen City of the Gulf.

PROPAGATING SHRUBS.

The natural method of propagating shrubs is by the seed, said Mr. W. C. Strong, at a meeting of the *Massachusetts Horticultural Society*. It is the cheapest, but also the slowest, and can only be used when we have seed-bearing plants, and can give the time.

If we are in haste with a new kind, grafting upon strong, congenial stocks gives a great gain in time. The rarest evergreens are multiplied with great speed and facility by this process. It is only necessary to start the stocks in pots, and when the sap is fairly moving, to side-graft the dormant scion, and then pack away in a shaded frame in the greenhouse, kept moist with sphagnum; and in a few weeks a skillful workman will show a large per cent. of well-established plants.

Deciduous shrubs are seldom grafted, but oftener propagated from cuttings of soft wood. The cuttings are taken in July or August, when the wood is in a half mature state, and put into boxes having two or three inches of soil at the bottom, and an inch or two of fine sand at the top. In close, shaded frames, with a slight bottom heat, the cuttings will root freely, and be strong enough to pack away during the winter. In spring they should be planted out, and will make stocky plants by autumn.

A cheaper mode, and effectual for many shrubs, is to cut the hard wood into proper lengths in autumn; then bury it in dry soil, in open ground, in bundles, bottom ends upward, sheltering with boards to keep from rain and severe freezing and thawing. In the early spring, plant firmly in carefully prepared garden soil. A large per cent. of most varieties will make a vigorous growth.

For those who cultivate plants in greenhouses the easiest method is to take cuttings of the soft wood in February, March, or April. These root readily in an ordinary propagating bed, and are ready to turn out into the open ground in May to make strong plants by fall. Those who raise Roses for winter-cut flowers find this method the most satisfactory. The essayist has been trying an experiment in feeding cuttings with a solution of cow manure just as the callus is forming, and is convinced that it induces the throwing out of strong, healthy roots, of more substance than we can get in pure sand.

TO HORTICULTURISTS.

Many will receive this number of THE AMERICAN GARDEN who are not subscribers. We ask your attention for a moment, in the interest of your own work and of the grand cause of horticulture. As you will see below, this magazine has recently changed hands, and is now an independent journal of horticulture, in fact the only one of its class in America. And by this we do not reflect in the least upon any other publication, for the grand old *Gardener's Monthly* is without a peer in its field. *Vick's Magazine*, the *Ladies Floral Cabinet*, *Green's Fruit Grower*, and a few others are excellent journals, and have their own fields. A few of the weeklies give considerable space and much good work to horticulture. We wish them all God speed, and will do all in our power to promote their interests for the good of horticulture. But still, THE AMERICAN GARDEN is the only popular journal of general horticulture in America. Its special field is not only among

skilled fruit growers, florists and gardeners, but it aims, also, to promote horticulture in all its phases, among amateurs, farmers, mechanics, professional men and all lovers of flowers and fruits, and of gardening.

Does not such a paper merit your support? We believe it does, and that you will say YES with emphasis, and will help such a work with your subscriptions and advertisements, and efforts among your neighbors in its and their behalf.

PLANTS AS PURIFIERS.

Dr. James Evans, in a paper read before the South Carolina Medical Association, says that the net-work of fine fibrous roots of trees and plants traversing the soil in every direction feed on the organic matter which would otherwise undergo decomposition and pollute the soil, air, and surface water. The vegetation also absorbs any excess of moisture and drains the soil. This is no doubt true, says A. S. Fuller; but it is often very difficult to so manage plant culture that there should neither be too many nor too few about our dwellings. The exhalations of trees and smaller plants may aid greatly in dispersing moisture, but it is also true that shade arrests evaporation and keeps the soil moist for a much longer time than when it is exposed to light and the direct rays of the sun. Plants and trees are no doubt great purifiers, but the jungles of India and the swamps of Africa are not healthy localities, although vegetation in great variety abounds, and in the utmost profusion.

OUR BOOK TABLE.

Outing, we are happy to note, meets with the full share of success it justly deserves. Each number is an improvement upon the last. Its holiday number is ready to greet the new year with a feast of jollity and good cheer, and the many artistic illustrations interspersed through its pages make it especially attractive. The "Amenities" department is bright and witty; the Letter-File contains contributions on various topics of interest to OUTING people; the Records are well kept up, and the Editor's "Open Window," though closed against the winter wind, is open to the sunshine that fills all departments of this indispensable and charming magazine. The Wheelman Co., Publishers, Boston, Mass.

German Simplified, by A. Knoflach, Tribune Building, New York, (The American News Company, Agents.) This new publication, issued in consecutive numbers, embodies the results of many years of earnest study and successful teaching of the author. His system, which is based almost entirely upon object lessons, is so simple and easy that to any one desiring to learn the German language with as little hard work and study as possible, this publication will be a welcome friend.

Schoolgardens of our Public Schools, by Julius Jablanczy, Klosterneuburg, Austria, (German.) A small pamphlet in which the author who has devoted his life's work to this object points out the great advantages to be derived from the establishment of gardens in connection with public schools. The different chapters of the work treat of the general purpose and management of a school-garden; of what it should contain; how it should be arranged; plan and description of a successful school-garden; and a select list of fruits.

Transactions of the Mississippi Valley Horticultural Society, for the year 1884, being a report of the fifth annual meeting, held at Kansas City, Mo. Together with a full list of the papers read, with accompanying discussions; also, list of members, lists of officers of horticultural societies, business directory, and sketch of the horticultural department of the world's Industrial and Cotton Centennial Exposition at New Orleans. The limited space now at our disposal hardly permits as complete a review of this excellent volume as it deserves, but if there is any other report of three hundred pages that contains more solid, practical, horticultural information than this, we have not seen it. This is easily accounted for when it is considered that the subjects discussed at these meetings embraced almost every branch of horticulture, and that among those who took part in the discussions were many of the most ex-

perienced and renowned horticulturists in the country; and that in addition to this, the secretary's work is done in so able and exemplary a manner that any special subject may be referred to in a moment. The book is presented to all members of the society, and may be obtained from the Secretary Prof. W. H. Ragau, Greencastle, Ind.

Orchids, The Royal Family of Plants, with Illustrations from Nature, by Harriet Stewart Mier. Published by Lee & Shephard, Boston.

The publication of a work of this kind furnishes a stronger proof and clearer indication of increasing refinement and elevated taste among our wealthier classes than anything else could offer. The expense incurred by its publication must have been very great, and unless the publishers felt confident of corresponding sales, they would hardly have risked the investment. The book is a large octavo volume, gilt-edged, and finished in the highest style of art.

While the principal object of the work is not that of a scientific treatise, sufficient of the botanical classification and general characteristics of the family are given to make the reader familiar with the general features and most striking peculiarities of these marvellously beautiful plants. In opening the book it becomes at once apparent that the author's chief aim was not to frighten her readers with dry scientific introductions, but rather to entice them into a gorgeously blooming, fragrant orchid-house, where she felt ure to be able to interest them sufficiently to hold their attention without danger of wearying them. In a pleasing, fascinating style the author describes, from the amateur stand-point, all the most beautiful species generally found in cultivation; interweaving through her discourse the history, modes of cultivation, mythological legends relating to the respective species, together with some of the choicest poetical productions of the English language.

But the grand feature of this work are its magnificent life-like colored plates representing:

Dendrobium Devonianum, *D. Ainsworthii*, *D. nobile*, *Masdevallia Veitchii*, *Cattleya Trianae*, *C. Chocoensis*, *C. Mossiae*, *C. Lodigesii*, *Laelia autumnalis*, *L. Dayana*, *Phalaenopsis Stuartiana*, *P. Schilleriana*, *Ancidium Barkerii*, *Calanthe Veitchii*, *Aerides quinquevulvum*, *Odontoglossum Reezii album*, *O. triumphans*, *O. Alexandrae*, *Lycaste aromatica*, *Vanda suavis*, *Cymbidium Hookerianum*, *Cypripedium niveum*, *C. Haynaldianum*, and *C. Spicerianum*. Every one of these plates is a work of art from which the species and varieties represented may be identified at a glance.

With an increasing taste for Orchids for parlor and table decorations, and the prospect of their soon becoming the fashionable flowers, this work should meet with large sales among our wealthier classes. Certainly nothing could be more indicative of intelligent refinement and cultivated taste than the presence of such a volume upon the parlor or library table; and as a present it would, by many persons, be highly appreciated, and preferred to living flowers.

Back Numbers of the American Garden.—Correspondents will please take note that the price of back numbers of this magazine is 10 cents per copy, and we cannot afford to send them for less, for any purpose, on account of their cost and the time required in sending them.

ANSWERS TO CORRESPONDENTS.

Trailing *Pyrus Japonica*.—An old correspondent writes: "This last summer on a *Pyrus Japonica*, a shrub of very scrubby form and not at all given to meandering, about the middle of July several shoots commenced to grow from the top. They continued to grow vine fashion, three yards or more, and turned round and round until they resembled an English Ivy on a round trellis. I would like to know if such a growth is common, and if it is likely to stand the winter." On bushes that have been pruned back in the usual way, such a growth is not very common, but the plant is amenable to being trained over arbors and trellises as readily almost as a vine. Late and immature growth of any plant is not likely to survive very severe winter weather, unless a light covering with evergreen branches is given, which will probably preserve it.

Tree Peonies.—M. F. C. Tusk, N. S.—This class of Peonies may be propagated by division of the roots. Cuttings of the young shoots in spring, by layers and suckers, but they are rather difficult and slow of propagation. The principal method of propagating them followed by nurserymen is by grafting on the roots of the herbaceous kinds. There are a great many varieties, some of them of exceeding beauty in cultivation. For a small collection we should name as the most desirable varieties: *alba plena* double white, shaded with purple at the center; *Arctusa*, light rose, shaded with purple, large and fragrant; *extensa*, very large; rose, clouded with purple; *Reine Elizabeth*, rosy crimson in center, shaded off to a light rose towards the margin, full and of very large size; *Kochlerii*, dark rose turning to purple; *Banksii*, very large, fragrant, rosy blush with purple center.

THE AMERICAN GARDEN,
Lately published by Messrs. B. K. Bliss & Sons, was made a monthly magazine and built to a high point of excellence by them and by Dr. Hexamer. Under the new management it becomes an independent force for the promotion of horticulture in all its branches, and seeks support from horticulturists everywhere. It now has no mercantile affiliations, and has nothing to sell. This volume will be greatly improved in many ways.

It will have the best contributors among practical horticulturists.

It will give more attention to new fruits, flowers and vegetables.

It will pay considerable attention to seeds and seed growing.

It will promote the work of women in horticulture.

It will be a special help to boy and girl gardeners.

It will aim to be the leading horticultural publication in America.

It will continue to be accurate, thorough and helpful in teaching the best methods of culture and the best varieties to plant.

TO ALL HORTICULTURISTS, GREETING:

The American Garden is recognized as the foremost popular periodical for general gardening and allied branches published on this continent; and now that the only objection that has ever been made to it—that of its having been published by a firm engaged in the sale of horticultural wares—has been removed, there is nothing to prevent its becoming the independent and impartial organ of progressive *American Horticulture*. To accomplish this end is my most ardent desire, and to aid me in this endeavor I appeal to every intelligent horticulturist who appreciates the importance and value of such an organ. Let every one co-operate in the way he considers most effective, and for my part I promise that all the strength, all the work that is in me shall be devoted to the common cause.

Yours fraternally,
F. M. HEXAMER, Editor.

THE NIAGARA WHITE GRAPE.

This noted grape, now first put upon the market by the Niagara White Grape Co., and by the general agent, T. S. Hubbard of Fredonia, and their authorized agents, is also offered to THE AMERICAN GARDEN family in return for good words in behalf of this magazine. See page 15.

SOME VALUABLE NEW VARIETIES.

Everybody has heard of the enterprise of the *Rural New Yorker* in disseminating seeds of valuable varieties of field and garden plants. This year its publishers send out seeds of selections from a crop of 50 varieties of Indian Corn grown in the same field; the Stratagem Pea, which we have tried and know to be good; the now famous Johnson's Grass of the South, for northern cultivation as it has proven hardy; the Bicolor Tomato; King Humbert Tomato, recently described in these columns; the Prince of Wales Pea; a Green Flageolet Bean, we have grown it several years and know it to be a superior sort; and a large collection of flower seeds. All of the above are sent free to every subscriber. And we will send THE AMERICAN GARDEN with its presents as on page 15, the *Rural New Yorker* and the above valuable seeds, all for \$2.00.

ARE YOU READING ANYTHING?

"THE AMERICAN GARDEN" IN CLUB WITH OTHER PUBLICATIONS.

If you want any of the following leading publications for 1885, we will send them in club with AMERICAN GARDEN for the prices named in the last column. This offer is good for both new and old subscribers. And all club subscribers are also entitled to the seed and plant premiums offered on page 15 to each subscriber.

A. Publisher's price for both.

If you want more than one of the above or any other publications in club with THE AMERICAN GARDEN, we will give prices on application.

Address,
E. H. LIBBY,
New York, Greenfield, Mass.

TO OUR FOREIGN SUBSCRIBERS.

On account of the long time required for notices to reach our foreign subscribers, and remittances to be made for renewals, we shall continue to send THE AMERICAN GARDEN to them until a sufficient time will have elapsed for them to have replied to our circulars notifying those whose subscriptions have expired of the fact. Some may get the renewal notices who will have already sent their subscriptions for 1885. All such will understand that the mails probably crossed en route, and that they will get due credit for their remittances.

If any desire to remit for several years at a time, and thus save the trouble and delay of these annual renewals, we will make a discount of 5 per cent per annum on all remittances for more than one year's subscription, to be deducted before remitting.

THANK YOU! THANK YOU!

We extend our hearty thanks for the many kind words that THE AMERICAN GARDEN has received from the friends of horticulture consequent upon its change of publishers. It is our aim to make a journal that will command the support and co-operation of all horticulturists in our efforts for the promotion of horticulture. With your encouragement in words and subscriptions and efforts among your friends, we shall add to the success already attained. And the proceeds of our success shall go toward the promotion of horticulture in all good ways.

GOOD READING AT LOW COST.

Green's Fruit Grower is an excellent pomological quarterly, as almost everybody knows. Mr. Green has recently written a bright and valuable book on "How to Propagate and Grow Fruit;" Price, 50 cents; cloth, \$1. We will send the *Fruit Grower*, the book, and *The American Garden* to any address for \$1.20.

"HOW THE FARM PAYS."

Those who read with interest the review in our December issue of the new book by Peter Henderson and William Crozier will be pleased to learn that we have arranged to send this book prepaid to any person who will send us four subscriptions to THE AMERICAN GARDEN at \$1 each. (Value, \$2.50)

YOUR

SUBSCRIPTION HAS EXPIRED.

Why not ask your neighbor to let you send his subscription along with yours? Please see page 15 for seed and plant premiums and list on page 14 for club rates with other publications. THE AMERICAN GARDEN for 1885 will be better worth your \$1 than ever before.

This number of THE AMERICAN GARDEN is sent to several thousand persons whose subscriptions expired with the December number, as reminder of their neglect to forward their subscriptions for 1885. PLEASE RENEW PROMPTLY, and thus save us much work and expense. Why not to-day?

THE AMERICAN GARDEN.

IS NOT

Connected with any mercantile house.
An organ of any merchant.
An advertising sheet.

IS

An independent Journal.
Devoted wholly to horticulture.
The organ of fruit, flower and vegetable growers.
Edited and written by practical horticulturists.
The only journal in America devoted to general horticulture for popular reading.

ASKS

The cordial co-operation of horticulturists in subscriptions and advertisements.
A good word for it to your friends.
Prompt renewals of subscriptions.

HAS

No axes to grind.
Nothing to sell.
Nothing to puff.

WILL NOT

Puff unworthy varieties.
Admit fraudulent advertisements.

WILL

Give every new variety and method a fair hearing.
Expose fraud of every degree.
Stand fearlessly for truth.
Promote all good work in horticulture.
Be greatly improved in 1885.
Deserve support.

An exact copy of a photograph of a **Niagara White Grape Vine** planted in the spring of 1878, as it appeared with its first load of fruit in the fall of 1880, on 48 inches of bearing wood, with 63 clusters, at Lockport, N. Y.

THE NIAGARA WHITE GRAPE, one vine of which (value \$2.00) we will send free, postpaid, to any person who will send us four subscriptions to the **AMERICAN GARDEN**, at \$1.00 each. For ten subscriptions we will give three strong plants, sent prepaid anywhere in the United States. Each vine will have attached to it the seal of the Niagara White Grape Co., as guarantee of genuineness.

THE
American Garden

New Year's Presents to every Subscriber.

Though we do not believe in premiums given to induce people to pay a dollar for a periodical worth many times that amount, yet in the present competition among publishers we are impelled to offer these inducements in order to get people acquainted with a magazine which they are likely to stick by for many years thereafter. Our old subscribers require no such inducements and are renewing promptly, but we believe in treating all alike, hence we send these presents to all who will tell us their choice.

These presents are all sent by mail prepaid, except as stated.

If you, or your wife, or daughter, or son, or friend, wish to earn money easily, you and they can do it by soliciting subscriptions among your neighbors for *The American Garden* on the terms below offered. If you don't want the premiums offered for clubs, we give cash commissions as follows: For \$5 we send 6 copies one year; for \$7.50 we send 10 copies one year.

A PRESENT TO EVERY SUBSCRIBER TO

The American Garden

We will send free, postpaid, to every subscriber at \$1.00 his choice of one of the following lots:

SEEDS.

- No. 1. *Wild Garden Seeds*: half-ounce packet of 100 varieties choice flower seeds; cost \$5.00 in single packets.
 - No. 2. *Pansy, Perfection*: splendid, large, vigorous.
 - No. 3. *Single Dahlias*: seeds of 100 choice varieties.
 - No. 4. *Hollyhock*: choice double mixed.
 - No. 5. *Balsam, White Perfection*: large, pure white, Camellia formed, good for pot culture.
 - No. 6. *Everlasting Flowers*: seeds of 12 distinct sorts.
 - No. 7. *Ornamental Grasses*: seeds of 12 best varieties.
 - No. 8. *Pea, Bliss's Ever Bearing*: 1 packet; new, very prolific, excellent quality.
 - No. 9. *Pea, Bliss's Abundance*: 1 packet; new, early, dwarf, very fine.
 - No. 10. *Chou de Berghley*: 1 packet; new vegetable here, hardy.
 - No. 11. *Onion, Giant Zittau*: 1 packet; from Europe, handsome, enormous size, pleasant flavor.
 - No. 12. *Water Melon, American Champion*: 1 packet; highly recommended.
 - No. 13. *Potato, Dakota Red*: 1 tuber; a promising new sort; late; very prolific; of high quality.
 - No. 13A. *Marlboro Raspberry*: 1 strong plant of this famous new sort; from the originator; cost \$1.00 each.
- [For 10 subscriptions we will give 25 plants; for 30 subscriptions, 100 plants.]
- No. 13B. *Parry Strawberry*: 3 plants; new; very large, beautiful, high quality, perfect flower. (Price \$2.50 per dozen).

PLANTS AND BULBS.

- No. 14. *Tritoma uvaria* (Red Hot Poker Plant, or Flame Plant): one of the best hardy plants.
- No. 15. *Calla Athiopica* (Lily of the Nile): a strong root of this stately plant.
- No. 16. *Clematis crispa*: beautiful, new, flowers 1 to 1½ inches across, lavender blue and white, delicious perfume.
- No. 17. *Tigridia grandiflora alba* (New white Tigridia): a splendid acquisition.
- No. 18. *Lily of the Valley*: 6 flowering crowns of these dainty plants.
- No. 19. *Clematis coccinea* (Scarlet Clematis): grows 8 to 10 feet in one season, coral red flowers.
- No. 20. Choice of 25 cents' worth of seeds from the catalogue of any reliable seedsman.

PREMIUMS.

TO THOSE SENDING SUBSCRIBERS TO

THE AMERICAN GARDEN.

We offer a choice from any of the following valuable articles to all who will send the number of subscriptions named with each article. Everything described is **first-class** in every way, and can be **fully relied upon**. Great care has been exercised to offer none but the **best** and none but those possessing **great merit**.

Almost any one can in a few hours gather names enough to get some valuable needed article **Without Expense**.

REMEMBER, that EVERY SUBSCRIBER in the clubs will receive one of the valuable presents of seeds and plants above enumerated, if asked for when the subscriptions are sent. Address all orders to

E. H. LIBBY,

NEW YORK, OR GREENFIELD, MASS.

A. Niagara White Grape: We will give 1 strong plant of this famous new white grape, unquestionably the finest white grape for general purposes yet produced, for 4 subscriptions at \$1.00 each. Sent by mail prepaid.

For 10 subscriptions at \$1.00 each, we will send 3 strong plants. (Lowest retail price, \$2.00 each.)

SEED Warranted to Grow.

or order refilled gratis. I have sold vegetable and flower seed to over a million farmers and gardeners in the United States, perhaps some are your neighbors, if so ask them whether they are reliable. Mr. Thomas Henshall of Troy, Kansas, writes me: "For 26 years I have dealt with you. I have lived in Iowa, Missouri, Colorado, and Kansas, and no matter what the soil or climate, the result was always the same, to wit: religiously honest and good." This is the kind of seed I raise and sell. The Hubbard and Marblehead Squash, Marblehead Corn, Marblehead Cabbages, Ohio Potato, Eclipse Beet, are some of the vegetables of which I was the original introducer. A Pair with \$500 in premiums. See my catalogue, free to all.

JAMES J. H. GREGORY, (Seed Grower), Marblehead, Mass.

Many Agents are Making \$5 to \$10 per Day "HOW THE FARM PAYS." SELLING OUR NEW WORK ON FARMING. Single Copies mailed for \$2.50. Send for Table of Contents and Terms to Agents. PETER HENDERSON & CO., 35 & 37 Cortlandt Street, New York.

VICK'S FLORAL GUIDE

A beautiful work of 150 pages, Colored Plate, and 1000 illustrations, with descriptions of the best Flowers and Vegetables, prices of Seeds and Plants, and how to grow them. Printed in English and German. Price only 10 cents, which may be deducted from first order. It tells what you want for the Garden, and how to get it instead of running to the grocery at the last moment to buy whatever seeds are left over, meeting with disappointment after weeks of waiting.

BUY ONLY VICK'S SEEDS AT HEADQUARTERS. Colored Plate in every issue. Illustrated Monthly Magazine, Price, 81.25 a year; Five copies for \$5. Specimen numbers 10 cts; 3 trial copies 25 cts. We will send to one address Vick's Magazine and any one of the following publications at the prices named below—really two magazines at the price of one—Century, \$4.50; Harper's Monthly, \$4.00; St. Nicholas, \$3.50; Good Cheer, \$1.25; or Wide Awake, Good Cheer, and Vick's Magazine for \$3.00.

WHITE NIAGARA GRAPE
 THE NIAGARA WHITE GRAPE COMPANY, having decided to offer for sale to the general public, without restriction, a limited number of two-year-old vines of their CELEBRATED WHITE GRAPE NIAGARA, orders will now be received, and entered in rotation for vines to be delivered in the spring of 1885, until their stock of vines is exhausted. The merited popularity of this wonderful Grape among fruit lovers throughout the country, has induced unscrupulous persons to attempt a FRAUD in offering to furnish them to their customers at a reduced price, claiming that they are genuine Niagaras. This Company desires, therefore, to inform the public, that it now has, and always has had, the absolute control and possession of all the vines grown from the wood or cuttings of the Niagara up to this time. Only persons having a certificate of authority from the Company, under the Company's SIGNATURE, will have the right to take orders for or propagate it. The Marlboro Raspberry

With all the other varieties growing here, and with a knowledge of those catalogued throughout the world, we claim that the Marlboro has not an equal in desirable quality. We have invited all interested to come and see it, and neighbors and strangers without a single exception bear us out in the above statement. Interested parties and partisan journals may continue their misrepresentations. We say, come and see its earliness, its hardiness, its great growth of bush and unequalled size and perfection of all the berries. We also want you to eat it and try its solidity. Part of the crop was sent to Montreal, 450 miles by rail, in good order. First shipment brought 60 cents per quart, wholesale in New York, and ruled higher throughout the season than any other variety. Our new seedling grape, the

unequalled size and perfection of all the berries. We also want you to eat it and try its solidity. Part of the crop was sent to Montreal, 450 miles by rail, in good order. THE "PLANET JR" HOLLOW STEEL STANDARD HORSE HOE

NEW AS lately introduced, has no equal in the world. Its excellent work in the field has distanced that of all competitors. It is, in some sections, doing in one passage, the work of four or five old-style implements, and in others superceding the cumbersome and expensive two-horse tools. The "PLANET JR" HAND SEED-DRILLS and WHEEL HOES are the newest and best, lightest and strongest known. There are 7 distinct tools, each with special merits, no two alike or the same price; all practical and labor-saving. Let no Farmer or Gardener fail to study up during the winter evenings our 1885 CATALOGUE, which gives reduced prices, careful and exact engravings of these different machines, and such descriptions as will enable the reader to judge correctly of their merits. Thirty pages and Forty engravings. Free to all. Correspondence solicited.

"ACME" PULVERIZING HARROW, Clod Crusher, and Leveler.

AGENTS WANTED.

It is the best selling tool on earth.

The "ACME" subjects the soil to the action of a **Steel Crusher and Leveler**, and to the **Cutting, Lifting, Turning** process of **DOUBLE GANGS OF CAST STEEL COULTERS**, the peculiar shape and arrangement of which give **immense cutting power**. Thus the three operations of **crushing lumps, leveling off the ground and thoroughly pulverizing the soil are performed at the same time**. The entire absence of **Spikes or Spring Teeth** avoids pulling up rubbish. It is **especially adapted to inverted sod and hard clay**, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that **cuts over the entire surface** of the ground.

Variety of Sizes, 4 to 15 feet wide. — We deliver free at our distributing depots.

DO NOT BE DECEIVED. Don't let dealers palm off a base imitation or some inferior tool ON TRIAL. We will send a Double Gang Acme to any responsible farmer in the United States, and if it does not suit, he may send it back, we paying return freight. We don't ask pay until tried on his own farm.

FOURTEEN ACRES OF POTATOES YIELD 4,480 BUSHELS, ONE ACRE 528 BUSHELS, ONE-HALF ACRE YIELDS 280 BUSHELS.

Report on nineteen acres in Potatoes—"Mammoth Pearl," 14 acres yielded 4,480 bushels (280 bushels per acre.) History of the field for ten years, no manure applied since 1875. Only the Mapes Potato Manure applied since.

Soil—Clay, moderately heavy.

PREVIOUS TREATMENT—Had received no barn-yard manure for ten years, since fall of 1874. In Spring 1875 planted with Potatoes, yield fair. We never could get over some 40 barrels, 50 barrels at the outside, per acre, of potatoes, on the farm till we used the Mapes Potato Manure. 1875 in the fall, sowed Wheat and Timothy, applying 600 lbs. of ground bone, yield good. 1877, 1878, 1879 cut grass. 1880 planted potatoes on sod, using 800 lbs per acre of the Mapes Potato Manure. All but five acres had to be replanted on account of poor seed, yield, much reduced by this set back, about 40 barrels (2 1/4 bushels) per acre. 1880, sowed Wheat with Timothy in the fall, without any additional Manure, relying upon the Mapes Manure applied in the Spring to the Potato crop, yield in on the 14 acres over 30 bushels per acre. 1882, 1883, mowed for two years, plowed it in on the 14 acres over 30 bushels per acre. 1884, Spring, planted Potatoes on 19 acres including the 14 acres above described, applying 1500 lbs. per acre of the Mapes Potato Manure, 500 lbs. at the scab before harrowing, 500 lbs. scattered in the rows before planting, and 500 lbs. at the scab after hoeing, along the sides of the rows, when the vines were 4 or 5 inches high; Planted "Mammoth Pearl," home grown seed. Planted in rows, 3 feet apart (perhaps a little scant) and 15 to 18 inches apart in the rows. Cultivation—weeds were kept down clean until late in the season, when during the hot weather, they grew prodigiously, so that by the weeds together with the crab grass, every spot not taken up by the potato vines themselves, was fully covered by a thick mat. Some of the weeds were thicker than the heavy rounds of a chair, and hard to pull up. Yield: Three acres of this 19 acre piece were almost a failure, owing to poor seed or some other cause they didn't come up, the 16 were replanted, yield 470 bushels, or 157 bushels per acre. The balance of the piece, 16 acres yielded on measurement 4,480 bushels, being 280 bushels per acre. The quality of the entire piece was variable and not equal to the half acre in the experiment field with northern seed. This season in our section was one of the worst ever known for poor quality and liability to rot. We have now (Dec. 4th) some 500 to 900 barrels remaining from this lot, in cellar and they show no signs of rotting. An interesting experience in our neighborhood points to the trouble in quality and bad appearance of the potato being in some instances developed after the growth at the end of the season. A neighbor being apprehensive of rot dug several rows and sold the potatoes to the extent of some 40 barrels, at full market price, these potatoes were smooth, clean and handsome with no signs of rot. Only three weeks afterwards in digging the balance of the field the potatoes were found to be scabby, rough and anything but handsome. In comparing the yield from the 20 acres (280 bushels per acre) with the product of the one half acre (northern seed) 180 bushels equal to 560 bushels per acre, it will be seen that the yield on the half acre is about double the rate of the large field. The reasons for the same must be found in there being twice as many rows (18 inches instead of 36 inches apart) per acre in the small piece as in the large field, as well as in the difference in the seed (northern, instead of home-grown) and the larger quantity of plant food supplied. Wheat is now sown over the entire piece including the one acre potato experiment (half an acre mulched and half an acre not mulched.) This is an entirely different field from the 20 acre field of potatoes reported on last year. (Signed) W. S. COMBS M. D. FRESHOLD, NEW JERSEY.

REPORT ON ONE ACRE OF POTATOES YIELD 528 BUSHELS.

A. One half acre—"Mammoth Pearl," northern seed, yield 16,820 lbs. equal to 280 bushels.

B. One half acre—"Mammoth Pearl," Home raised, seed yield 248 bushels.

Piece "A" Ground accurately measured, one half acre (less 180 square feet.) Soil clay moderately heavy, but better adapted for potatoes than some clay soils containing iron and inclined to bake. The preparation of this acre was thorough and the land at planting very friable and nice. It had received no manure but the Mapes prior to 1881 and had been for many years in grass, neglected until there was only a thin soil full of weeds when it was plowed up in 1881 for corn. It was just such land as is term ordinary common farming upland. Potatoes planted in rows 18 inches apart, 12 to 15 inches apart in the row, covered and levelled flat. Smoothing harrow used until the vines were 2 or 3 inches high, kept clean from weeds up to that time, then a single tooth cultivator was run between the rows full depth, (say 5 inches) and the Mapes Potato Manure, 500 lbs. per acre, distributed in the cut or furrow for the purpose of inducing root growth from rows, then a mulch of wheat chaff was spread evenly two inches in depth over the entire surface of the half acre, excepting on one half the length of four rows, this strip was left without any mulch to test the effects of the mulching; no cultivation was given after the mulch was spread.

Fertilizer used. 800 to 900 lbs. of the Mapes Potato Manure spread evenly over the entire surface, after a broadcast dressing of 20 loads of stable manure: The yield was 16,820 lbs. equal to 280 bushels (60 lbs. each) on this piece, one half acre. These measurements were accurately made by disinterested parties. This very large yield is explained by the fact that the rows were twice as numerous as usual (18 inches apart instead of 3 feet) and the potatoes (contrary to expectations of some neighbors) instead of being small very large, unusually so and very superior in quality, rarely excelled. The test made on the half of the 4 rows (40 feet long) by omission of the mulching showed no difference in either quality or quantity of yield. There was no perceptible difference at harvest. If the season had been a dry one the mulching might have proved beneficial.

Piece "B." The conditions of this piece of one half acre, were apparently just the same as with the half "A," including character of soil, fertilizers used, method of planting, excepting that home raised seed was planted and "no mulch used." Yield was much inferior in quality and size of the potatoes as compared with plot "A." The product was not accurately weighed, but it fell short of the yield of plot A, by twelve to fifteen per cent. but was certainly not less than 248 bushels on the half acre. The potato bugs did considerable damage to this piece and reduced the yield, possibly enough to make up the difference. All of this potato ground had been fertilized for three years before, exclusively with the Mapes Manures. In 1881 1,000 lbs. for corn, 1882, 800 lbs. of the Mapes Potato Manure for potatoes, in 1883 with 500 lbs. of the Mapes Complete Manures for "Light" and "Heavy" soils, 1/2 each, for Wheat.

(Signed) W. S. COMBS, FRESHOLD, NEW JERSEY.

Send postal for new pamphlet (to be issued in January), containing full reports with diagrams of Potato Experiments at "Rural Farm," Dr. Lawes' Potato Experience, etc., etc. Address THE MAPES FORMULA AND PERUVIAN GUANO CO, 158 FRONT STREET, NEW YORK.

PROGRESSIVE

Farmers, you cannot afford to do without the **RURAL NEW-YORKER** for 1885! It is the National standard of Rural Journalism. The editors are farmers. They own 380 acres of experiment grounds, which are conducted in the interests of subscribers. The best writers in the world—500 original illustrations yearly. Its Free Seed Distributions are worth to subscribers many times the cost of subscriptions. It costs more to publish than any of its class, because it is original throughout. It is altogether unequaled in the originality and enterprise with which it is conducted. It contains 16 pages—fine paper. Liberal inducements and good pay to those who secure clubs for it. Reliable agents wanted everywhere. Over \$2,900 in presents offered to subscribers. Our premium list offers liberal remuneration for services. Sample copies free. Posters and premium lists mailed to all applicants. Address: the **RURAL NEW-YORKER**, 24 Park Row, New York.

IMPERIAL EGG FOOD

Will Make Your Hens Lay. Packages Mailed for 50 Cents and \$1.00. 6 lb. Boxes, \$2.00; 25 lb. Kegs, \$6.25. By Express or Freight Co. WHOLESALERS AGENTS: B. K. Bliss & Sons, N. Y. J. C. Long, Jr., New York. Benson, Mauls & Co., Phil. Parker & Wood, Boston. Geo. A. Kelly & Co., Pittsburg, Pa. Western Chemical Co., St. Louis, Mo. John Anglum & Co., Denver, Colorado. Geo. G. Wicks & Co., San Francisco, Cal. F. A. Daughtry, Shreveport, La. T. W. Wood, Richmond, Va. F. C. STURTEVANT, Proprietor, Hartford, Conn., Successor of Chas. R. Allen & Co.

BARNES' Patent Food and Steam Power Machinery. Complete outfits for Acial Workshop Business. Lathes for Wood or Metal Circular Saws, Scroll Saws, Planers, Mortises, Turners, etc. Machines on trial, if desired. Descriptive Catalogue and Price-list Free.

W. F. & JOHN BARNES, Rockford, Ill. No. 278 Ruby St.

THE BOARDMAN TREE PAINT.

Prevents Apple and Peach Borers, destroys Bark Lice and Orange Tree Scale, stops Mice and Rabbits from Girdling Trees. Also a remedy for Pear Blight, Sun Scald, Frost Cracks, Black Knot, etc. Sold by B. K. BLISS & SONS, 34 Barclay Street, New-York. Also, Seed Houses, Nurserymen, and Florists everywhere. Send for Descriptive Price Circulars and Testimonials NOBLE A. TAYLOR, Manufacturer, 105 Clark St. Brooklyn, N. Y.

No. 2.

A BUNCH OF ROSES.

A bunch of beautiful Perles des Jardins, Niphotos, Catherine Mermets and Bon Silènes which a generous friend has placed upon our table, spreads its delicious fragrance through the room and transports the mind to the balmy days of June. Indeed it is but a few years that Roses and June seemed as inseparable as snow and winter; and when now we find, in our large cities, Roses in greater demand, and more plentiful than in the "Month of Roses" itself we cannot but wonder in amazement how great and rapid has been the progress and improvement in this branch of floriculture.

The amount of money invested in growing Roses under glass in the vicinity of New York would seem incredible to the uninitiated. Not only are there many hundreds of forcing houses owned by professional growers, but many private establishments have separate Rose houses the surplus product of which finds its way to the markets. As a rule—not an infallible one though—the prices are naturally proportionate to the cost of production, and it will therefore readily be perceived how a few hundred, or thousand dollars even, may easily be spent in transforming a suite of parlors into a Rose garden.

This lavish expenditure for flowers is frequently condemned by contemporaries, arguing that this money might be devoted to worthier purposes. While this may, in some measure, be true, it is also true that it is not always an easy matter to correctly decide where and in what manner money may be used to the best advantage. "Give it to the poor," some will say. Now, the fact is that the rich as a class give a great deal more in charities than is generally supposed. On the other hand it is evident that the indiscriminate bestowing of charities does more harm than good, as instead of benefiting the recipients, they more frequently encourage them in idleness. That there are thousands of deserving poor in our cities cannot be denied, but it is not a very easy matter to reach them, as this class of poor shrinks from asking charities, and is not found lounging around soup houses and the offices of charitable institutions.

To devote a part of one's possessions to what gives enjoyment to oneself and friends is certainly an indisputed individual right. But to draw a comparison, the laboring man who spends five and ten cents every day for tobacco and drinks is proportionately far more extravagant than the millionaire who pays a thousand dollars a year for flowers. Nearly all this money paid for flowers goes directly to laboring people, and remains in the country, while that which is sent to Europe for paintings, statuary and luxuries of various kinds is of no benefit whatever to our own working classes.

It is far from our intention to undervalue art and its refining influences, but we do claim for horticulture a due share in its realms. To transform the wild Rose into

no painting ever so artistic could equal; and the thought arises whether the skill and labor that have thus annihilated seasons and storms, beautified and perfected nature herself, are not entitled to as much recognition as fine arts, and whether those who have devoted years of study and patient intelligent labor to this purpose are not as deserving of encouragement and reward as the painter and sculptor.

PRESEERVE THE FALLS OF NIAGARA.

One of the most disgraceful spectacles in our land is the wanton destruction of the vicinity of Niagara Falls by men utterly devoid of all aim higher than that of fleecing the largest amount of money possible from helpless visitors. We are therefore glad to

note that the Niagara Falls Association has begun active work again to preserve what is left of the natural scenery, even if all its former beauty cannot be restored.

At the large and influential meeting held in New York on January 9th, it was urged that influence be brought to bear upon the State Legislature, by forming branch societies in various parts of the state, and thus public opinion be aroused for the good cause. It must be made evident that the outlay demanded for the proposed park will be a profitable investment, and that an adequate return will be realized upon all moneys

expended. So laudable a scheme as the preservation of this great Natural Wonder, free and intact, forever to the people of this state and of the world at large, should commend itself heartily to the judgment of all right thinking persons; and no rightful means should be spared to provide what is needed in the future to secure the scenery of Niagara Falls from further destruction.

TWENTY-FOUR PAGES.

The pleasant pressure of appreciative patrons of our advertising department compels us to increase the capacity of THE AMERICAN GARDEN to 24 pages, or including the cover 28 pages. Present appearances prophecy a permanent increase to this or a larger size.

A BUNCH OF ROSES.

the perfect type of to-day and make it expand its glorious blooms in mid-winter; to metamorphose the small meadow Strawberry into the luscious "Jersey Queen;" to bring together the varying species of a genus from different parts of the world, and so hybridize and cross them as to produce new forms of flowers and fruits which combine the desirable qualities of all, requires as much, if not more, skill, science and perseverance than to portray the model on canvass or chisel in marble. The one produces the original, the other the copy.

As we take another look at our living bunch of Roses, while a fierce snow storm rages without, pelting wildly against our windows, the contrast between art and nature presents itself in vivid colors which

The Vegetable Garden.

SEASONABLE HINTS.

If not already done, no time should be lost now to secure a sufficient supply of all seeds that may be needed in the garden.

Old Seeds left over from last year are often as good as fresh ones. It would therefore be unnecessary waste to throw them away. Of some classes of plants, those of the Cucurbitæ, especially, two and three years old seeds are even preferred by market gardeners, to seeds of the previous season's growth. Other kinds, however, can not be relied on for more than one or two years. All old seeds should therefore be tested for their vitality, so that if they are found wanting, others may be procured before sowing time.

Testing Seeds of the ordinary garden vegetables is a very easy matter. All that is necessary is to place the seeds under the conditions necessary to growth, that is to give them moisture and warmth. With the hardier varieties, such as Radishes, Beets, Cabbages, etc., this may be accomplished by sowing the seeds in flower pots, by themselves or around window plants, and keep account of the percentage that sprouts. Tomatoes, Peppers and Egg-plants require more heat; these may be scattered between pieces of cloth, or blotting paper, placed near a stove and kept constantly damp.

But in testing seeds it should be borne in mind that the germination of seeds under such favorable conditions does not warrant the conclusion that they will grow out-doors equally well. Seeds may sprout under the genial influences of a greenhouse test, and yet be of so low a vitality as to fail when sown out-doors under less favorable conditions. The vigor of the sprouts and the time in which they appear have to be carefully considered in drawing conclusions from seed tests. If, for instance, out of one hundred Cabbage seeds, fifty should germinate within three or four days, and thirty within five and ten days making it eighty per cent. in all, this would indicate a low vitality of thirty per cent., and it would not be safe to count on more than fifty per cent. of strong healthy plants at the best.

In *Keeping Seeds* much depends on the manner and place in which they are stored. Under favorable conditions seeds retain their vitality much longer than otherwise. Seeds are not injured by the severest cold, provided they are kept dry.

Preserving Vegetables.—All kinds of ordinary roots are enjoyed at this season more than at any other, and nothing is more disheartening than after having raised a fine crop of Beets, Parsnips, Salsify and Turnips, and having stored them snugly in the cellar, to find them in mid-winter either frozen, or so shriveled up as to be unfit for use.

An ordinary cold-frame may serve excellently for the purpose, by digging out the soil, spreading the roots on the ground, covering with dry earth, several inches of dry leaves, and then replacing the sashes.

TWO CROPS OF POTATOES A YEAR.

In the South two crops of Potatoes may be grown in a season. This is occasionally done and it is strange that it is not a general practice, for it would yield more than double profit to the planter.

The first crop is planted early in the spring that it may mature early. The first planting can be done in February and the crop harvested in May. These are shipped North, where they bring "the top of the market." While digging the first crop the small Potatoes are sorted out and spread in some well lighted place, but where they will be protected, from the direct rays of the sun. In about two weeks they become of the greenish color indicative of maturity and are then fit to plant. They must be of this green color before being planted, or they will remain in the ground without sprouting until the following spring. The tubers are not cut for the second planting; it is always insisted upon that they must be left whole.

THE GREAT EASTERN POTATO.

The second planting is made from the middle to the end of June. The best plan is to drop the sets from eight to ten inches apart in rows and cover them lightly with a hoe; and the furrows (better the whole field) should be mulched with leaves, short straw, or some light stuff. If one or two good rains fall on them their success is assured; there is no chance of failure. The second crop matures in October and can be dug leisurely during the fall, as it is rarely the case that the ground is frozen much before Christmas. The second crop yields well, keeps better during the winter, and makes excellent seed for the next spring's planting.

As thousands of barrels of Potatoes are shipped from the North every year, it would certainly be to the interest of southern planters to double their home production by raising two crops a season. The early crop can be sold at a handsome figure because it can be put first of all upon the northern markets; and by raising a second crop for

home consumption the hazard of keeping Potatoes, always great in the South, is considerably lessened.

Only the small tubers are selected for seed for the second planting; this is characteristic of southern agriculture where ease is too often the first consideration. The small tubers mature (grow green) more rapidly than large ones, do not require cutting, and are not marketable. I do not propose to discuss the problem of large or small tubers for seed. I wish only to say that the tuber is not a seed, but a cutting, and a nurseryman who selected a weak stem for a cutting, and who would allow a large number of buds to grow upon each cutting, would be criticised by his brother nurserymen. Yet this is just what is done by the Potato grower who uses small seeds or who does not cut the tubers. JOHN M. STAHL.

NEW POTATOES.

Prominent among the new Potatoes that have come to our notice are the Great Eastern and Dictator, now being introduced by Jas. M. Thorburn & Co., 15 John street, New York. Both varieties have been originated by Mr. E. S. Brownell of Vermont, by crossing the Excelsior with Peachblow.

The Great Eastern, represented in our illustration, is an exceedingly handsome Potato of large size and flattened oval in shape. Skin white and smooth, eyes very few and almost even with the surface. The bulk of the crop is very uniform in size, and tubers weighing two pounds are not rare; its cooking quality leaves nothing to be desired. The vines are of medium height, stocky and healthy, foliage dark green. It matures medium early, grows compact in the hill and is, according to Mr. Brownell, one of the most, if not the most, productive variety in cultivation.

Dictator resembles the above variety very closely in general appearance; in shape it is more cylindrical, and its eyes are slightly indented; its season of ripening is about two weeks later than that of the former, and its keeping quality is unsurpassed.

A NEW USE FOR SAFE DEPOSIT VAULTS.

One of our well known New York seed firms has now on deposit in the Mercantile Safe Deposit Company's vaults four hundred pounds of Henderson's Snowball Cauliflower Seed, which at the selling price of one hundred dollars per pound shows the value of this seed to be forty thousand dollars. Not only is this plan of depositing in vaults found to be cheaper than insurance, but what is of more importance is that if the seed should be destroyed by fire this quantity necessary for their trade could not be replaced at any price in time for the spring sales. When it is considered that four hundred pounds of Cauliflower seed will under favorable conditions produce nearly thirteen million plants, which when headed for market and sold at over eight cents per head will produce the sum of three quarters of a million dollars, the value this vegetable has attained in this country, where twenty-five years ago it was almost unknown, becomes readily apparent.

HENDERSON'S NEW ROSE CELERY.

The ornamental appearance of Celery on the table is almost as important a factor in its value as its eating quality; the introduction of a rose-colored variety will therefore be welcomed by all who have an eye for beauty as well as a palate for taste. In Henderson's New Rose Celery, one of the novelties introduced this season by Peter Henderson & Co., 35 and 37 Cortlandt street, New York, we have not only a variety of superior flavor and crispness, but also one of remarkable beauty, its stems and heart being delicately shaded with rose.

"All who have had experience in the growing of celery," says Mr. Henderson, "know that varieties that are tinged with red are hardier and more solid, and hence better keepers in winter, and also that under the same conditions they are always more crisp and superior in flavor to the varieties that blanch yellow or white."

A combination of this new variety with White Plume and Golden Heart seems to admit of as much display of taste, almost, as the arrangement of flowers.

A NEW PEPPER.

With the introduction of some of the milder yellow varieties of Peppers has developed a taste for less pungency in this fiery vegetable. The Golden Dawn seems to fill this requirement pretty well, but it cannot be denied that the correct color in a pepper seems to be red.

Burpee's Ruby King, now introduced by W. Atlee Burpee, Philadelphia, is claimed, to possess as little pungency as is compatible with a respectable Pepper. It averages from four to six inches in length, by three to four in thickness, but many specimens grow considerably larger, and when ripe it is of a beautiful, ruby-red color. It is said to be always remarkably mild and pleasant to taste—unequaled, in this respect, by any other variety—so that it may be sliced and eaten with vinegar and salt like Tomatoes or Cucumbers. The plant is of sturdy, bushy habit, and remarkably productive.

THE CABBAGE AND ITS HISTORY.

Sometimes the least attractive objects are full of interest through their associations. To the casual observer, the Cabbage is a homely thing. The student of natural history, however, discovers facts connected with it which are most fertile in their suggestions, and which send a gleam of light backward into the mystery of the origin of species.

As seen in the markets, the Cabbage, Kale, Cauliflower, Kohl Rabi, and Brussels Sprouts are five very distinct vegetables. They have, however, one point in common. They all have a certain "Cabbage" flavor. The seedsman knows that the seeds of these five vegetables are strikingly alike, and the gardener is aware that the most careful scrutiny is necessary to distinguish the young plants. Despite their difference in form as we see them in the market, botanists are well agreed that these five vegetables have all descended from the same remote ancestor,—the wild Cabbage; and that the changes are the result of man's interference with the plant.

We should expect that the rag-a-muffin-boy from the streets of New York, adopted into a refined Christian family, would de-

velop gifts and graces that would never have appeared amid the squalor of his first surroundings. Just so the wild Cabbage, transplanted from the starved, and crowded state of its native home, into the fertile soil of the garden, where it was sheltered from the struggle for existence, became exuberant with vital force, and developed many, and marked variations from the original.

HENDERSON'S NEW ROSE CELERY.

The wild Cabbage now grows on the sea-coasts of Western Europe. It is described as a rather coarse, homely perennial plant, that resembles the vegetables mentioned above in few respects except in its flowers and seeds. It forms neither the head of the Cabbage, Cauliflower, nor Brussels Sprouts, the thickened stem of the Kohl Rabi, nor the lacinated leaves of the finer Kales. The

BURPEE'S RUBY KING PEPPER.

precise order in which these widely different plants have evolved from their common parent is, and probably must remain a matter of conjecture. Certain indications, however, aid us in forming opinions upon the subject. It seems most probable that these forms have not developed successively from one another, but that they are rather the outgrowth of nearly simultaneous variations in

different directions. The Cabbage evidently possesses great assimilative power, and when the wild plant was relieved from the crowding of other plants, and given abundance of food, it became fat, by storing up nutriment in great abundance. Sometimes this fatness was evenly distributed through the plant, as in the larger Kales. In other cases it became localized, giving to one, or another part of the plant an undue enlargement. As the value of the plant to man was in proportion to its accumulated nourishment, such variations were carefully preserved. Thus in certain plants, the stem became abnormally thickened, as in the Marrow Kale, by the continued selection of plants having the thickest stems through an indefinite number of years, a variety resulted having a roundish expansion upon the stem: our Kohl Rabi.

In other plants, the fatness became localized in the flower heads, by which the normal flowers were substituted by a tender, fleshy enlargement. This, being very delicate in flavor, was especially sought after, and the plants that produced the greatest number of these fleshy heads at the same time, were most prized. Thus, through centuries of selection, a plant was produced in which all the flower heads are fleshy, and are produced simultaneously: I refer to the Cauliflower.

Then in others, the superabundant nourishment was deposited in the leaves, in such a manner as to cause them to fold about one another: the Cabbage. Just how this folding is brought about, we do not know. Perhaps it is due to an excessive development, of the mid-rib, which being more prominent on the lower side of the leaves, causes the latter to curve inward.

In other plants the buds, which do not usually develop until the second year, became much enlarged, by a dense covering on tender leaves, forming the Brussels Sprouts; while in still others, the veins of the leaves became developed far beyond the parenchyma, forming the beautifully cut, and frizzled Kales.

Thus, through centuries, perhaps thousands of years of selection, a single wild plant has developed into five distinct vegetables. These marvelous changes are not the result of a preconceived plan, but rather of the slow, unconscious growth caused by the natural tendency to preserve the most desirable variations. "ELM."

MARVELOUS POTATO YIELD.

When a few years ago the former publishers of THE AMERICAN GARDEN offered premiums for the largest amounts of Potatoes grown from one pound of seed, the greatest yield reported was 1,694 pounds. This seemed so incredible that, at the time but few persons would believe it, considered the statement a pretty big Potato story? But when now, the committee appointed to award the premiums offered by the Bradley Fertilizer company of Boston, for the largest yields grown from one pound of Dakota Red Potatoes, with the use of their fertilizers, report a yield of 2,558 pounds, that former big Potato story sinks into insignificance. Yet any one who knows that Potato slips may be propagated in geometrical progression, will not doubt for a moment, that these quantities can actually be produced.

The Fruit Garden.

SEASONABLE HINTS.

Whatever preferences and theories fruit-growers may have as to the best season for pruning, there is no month in the year during which it can be performed more conveniently than February. The ground is still hard so that it is easy to move about and cart away the brush; the absence of foliage exposes every limb and branch to plain view; the days are rapidly becoming longer and warmer; and above all there is more leisure now than at any other season.

Pruning Trees.—In well managed orchards it becomes seldom necessary to cut away very large limbs, the trees having been so trained when young that there will not be any superfluous main branches. But as not all orchards are in this enviable condition, large branches will sometimes have to be removed. In this case the wounds thus produced should be covered with some substance that protects them against the influence of water and air, else rot soon sets in, and will ultimately destroy or seriously injure the entire tree. Grafting wax, shellac dissolved in alcohol, mastic, cow dung and clay, and other substances are used for this purpose, but for convenience of application and, at the same time, answering all purposes nothing is better adapted than the ready mixed common paints, applied undiluted.

Pruning Grape Vines.—There is no more vexatious question confronting the amateur fruit-grower than what to do with an old, neglected, entangled grape-vine; and the advice he generally gets—to cut it down and plant a new one—is about as satisfactory to him as that of exterminating bugs by setting the house on fire. Both remedies are radical but they do not always answer all purposes.

In pruning grape-vines, old or young, the main point to keep in view is that the fruit is borne only on young wood, therefore all the old, naked branches, farther than serving as a support to the fruit bearing canes, are only so much dead weight which has to be nourished with food that should be devoted to the production of fruit.

If there are any young canes starting from near the roots of old vines, these should be taken good care of and made to form the frame of the rejuvenated vine, while a few of the largest, bare old branches may be cut away entirely. The remaining ones should be tied up so as to allow as much room and sunlight to the young canes as possible. The following year another part, or all of the old wood may be cut off according to the growth and vigor of the young canes. If there should be no young shoots at all it is generally best to layer one of the most vigorous and flexible branches to a convenient spot and treat like a young vine. In a year or two it may be detached from the parent vine whose place it may now take.

Pruning Raspberries and Blackberries at this season consists simply in removing all old dead canes and shortening in last year's growth. If they have been summer pruned, as advised in previous numbers, only the side branches have to be clipped to about eight or ten inches, but when this has been neglected the main canes have to be cut back and tied to stakes or trellises.

MANAGEMENT OF ORCHARDS.

Whether the land occupied by orchards of fruit trees should be plowed and cultivated, or sown in clover and grass and remain undisturbed is still a frequent subject of inquiry in the correspondence of the Agricultural Department, says Superintendent Wm. Saunders. The object in planting fruit trees, it is hardly necessary to state, is to produce fruit, and that course of general treatment which best maintains the trees in a healthy state of growth, and at the same time keeps them in a condition of productiveness, may be considered as being good, whether the treatment involves the plowing and cultivation of the soil, or whether these good results are attained by sowing the orchard in grass, and keeping the surface covered with sod.

It is well known that eminently productive and profitable orchards can be shown under both of the above systems of management, for the time being. Cultivation or non-cultivation are simply expedients to be adopted in gaining certain wished-for results; the primary mistake is to attempt to turn either expedient into a fixed and unchangeable system.

The processes generally included in the term cultivation, such as plowing, harrowing, &c., are all favorable to the encouragement of growth in plants, and when applied to fruit trees, the usual result of increased vigor will be produced. But it is also well understood that the greatest vigor of growth is not always combined with the greatest productiveness of fruit; on the contrary, it is a recognized fact that a tree cannot display unusually great vigor of growth and at the same time be correspondingly fruitful.

On the other hand, it is common knowledge that trees growing in poor soil, and without receiving cultivation of any kind, will not long continue to maintain sufficient vitality to enable them to produce perfect fruit, nor, indeed, fruit of any quality. These extremes of poverty and luxuriance are similar, inasmuch as neither condition is the best for the production of fruit, and therefore the efforts of the fruit-grower should constantly be directed towards a medium between these extremes.

When trees have reached a fruit-bearing size, but give no evidence of a fruit-bearing disposition, it may be assumed that their barrenness is owing to the excessive growth, and it will therefore be in order to adopt some means of checking the growth, and as a consequence, induce the trees to bear fruit.

Various measures may be pursued to effect this object, but perhaps there are none so simple and so easily applied as that of laying the orchard in grass. The absence of all culture will speedily cause the formation of fruit buds and satisfactory crops of fruit, and so long as this continues no change need be made; but if the trees become weak, from overbearing, or from want of nourishment, top dressings of manure will again renew their vigor; and, further, if the trees appear to be stunted and do not respond to surface stimulants, the grass may be plowed under and a system of thorough culture inaugurated and kept up so long as observation determines that it is the best practice to follow in the case in question.

The conditions of the trees will therefore be the best evidence as to whether the or-

chard should be cultivated or kept in grass. Each orchard will answer the question for itself. It is not a question as to the advisability of establishing a system based upon either expedient, although it is usually and erroneously submitted in that shape.

THE KIEFFER PEAR.

It is an old saying that the best way to prove a pudding is to eat it, and likewise the best plan to prove the value of a market fruit is to put it on the market and let the people decide. I am aware that last season there were made some famous sales of this fruit, which were duly reported but the results of those sales were not published. Why! because they were not in keeping with the sales; for those who purchased the Pears for their beauty and upon the recommendation of the salesman were disappointed with the fruit. I do not hesitate to say that the propagators of this variety did the fruit more harm by ascribing to it qualities it does not possess, than its enemies did in belittling it, for in the one instance the purchaser was disappointed in not finding the expected extra good qualities, while its enemies overlooked the really good ones it does possess.

There is no doubt in my mind that the Kieffer will never be classed among the fine varieties of eating Pears, but this is no reason to suppose it destitute of any merit whatever, and debarred from occupying another not less honorable position. This Pear will be sought for in large quantities by the middle class of dealers and consumers and by restaurants for cooking purposes. It is a singular fact that good cooking Pears are a scarce article in our market, and this scarcity has depreciated their consumption so much that they are found on but few tables in our city.

The Kieffer will fill this great want, for when properly managed it appears in more golden beauty than any other variety. Besides it is never false hearted or rots at the core, but has a firm juicy flesh slightly acid and not of disagreeable flavor, some think it tintured with the Quince. I had some very beautiful ones sent to me this season, and calling the attention of some dealers to them, they all decided that they never had seen a handsomer looking Pear. These were shipped in boxes containing a trifle less than a bushel, and sold, the selected ones, for \$2.75 per box and the second quality from \$1.50 to \$1.75 per box. They found a ready market at these prices and many more could have been sold at the same price.

For preserving, the Kieffer will also be much in demand; its large size, pure whiteness, and rich, sprightly flavor when cooked make it admirably adapted for this purpose.

Cultivators of this variety should be cautious in picking it. Being a late ripener it must not be picked too soon else it will not color well, and without being well colored, sales will not be found satisfactory, for its beauty is its chief attraction in market. It is a good keeper. I have some now, the middle of January, that are as sound as the day they were picked. Persons who fruit them the coming season should lay some away in a cool place where they can watch the coloring as well as the keeping process so that in the future they need not rush their fruit upon the market when it has to be sold for a low price.

C. W. DELL.

THE NEMAHA BLACK RASPBERRY.

This new Black-cap originated with Hon. Robert Furnas of Nebraska who considers it a meritorious variety, and with whom it has proved hardier than the Gregg. Mr. Charles A. Green who has fruited it two seasons in Western New York states that it has proved hardy, vigorous, of unsurpassed size and productive. Its season is even later than the Gregg. It is a firm berry, of good quality. Previous to the Nemaha we have had no late variety that is hardy. Early varieties ripen their wood and stop growing early, going into winter in good condition. But Gregg and Mammoth Cluster mature the wood and hold their leaves very late, and winter finds them with soft and tender wood, and they often get injured by severe weather. Especially is this the case on clayey, cold soil. On sandy soil they are much more hardy.

If the Nemaha proves to be more hardy it will be a great gain, and Mr. Furnas is very positive that it is. Single specimens have been picked, larger than from any other variety, but its average size is about that of the Gregg.

SMALL FRUITS AND QUICK RETURNS.

We are all anxious for quick returns from our investments in this country; nor is that a matter of wonder when it is considered that but few of us have the spare capital to invest for a long term without dividends. It is to be lamented, however, that we frequently ignore our best interests by not taking a little farther view into the future. While it is imperatively necessary that the successful horticulturist possess sufficient forethought and patience that will enable him to plant fruit trees that he must wait long years for his return from, he should not fail to avail himself of those varieties of fruits that yield him a quick return, during what would otherwise be considered a profitless period.

The small fruits offer this relief. Most of them give a good return the second year after planting, and some, the first. The most successful Strawberry growers now get their heaviest returns the next year after planting. Mr. J. M. Smith, the veteran horticulturist of Wisconsin, always plows up his Strawberry beds after the second year, and as he raises a crop of vegetables between the rows the first year, he hardly feels the cost of the frequent plantings.

I have obtained very fair crops of Raspberries the next year after planting. Where the ground is rich they will grow remark-

ably fast the first year; and by a judicious system of nipping back of shoots the second year, a good fair crop may be secured. By the way, a practical friend of mine was telling me the other day, how he managed to propagate Raspberry plants very rapidly. Before covering the tips of the stems that he wished to propagate from, he cut off the ends. This, he said, caused them to send out several shoots and a larger mass of roots than could be obtained by the old way of burying without cutting.

Dwarf Pears and Cherries often yield a good crop the second year after planting; but for the aftergood of the trees such early bearing in large quantities, should be discouraged.

It is very seldom that tenants of hired or rented land, set out fruits of any kind; and

or fruit-garden that is to be of permanent benefit to their property.

Surely, no man who is building himself a home upon his own land, will neglect to gather these home comforts about him. What if he be old, and his tenore of life well-nigh run; there are others coming after him, and what more fitting memorial can one leave behind? W. D. BOYNTON.

THE PEACH-BORER, IN BRIEF.

The little white caterpillars with sixteen legs that eat the bark and sapwood, often girdling Peach trees just beneath the earth, and causing gum to ooze out, are Peach-borers, says Prof. A. J. Cook, in the New York Tribune. A beautiful blue, wasp-like moth lays eggs at the base of the tree in July and August. These soon hatch, and the little larvæ begin at once to feed on the bark and sapwood. When winter shuts in they will be from a quarter to nearly three-quarters of an inch long. Next June they will pupate in their own chips, and the moth comes again in July and August. The varying time of the moth's appearance explains the varying size of the caterpillars, which led Dr. Harris to suppose they were two years in developing to maturity.

The sure way to destroy these harmful borers is to dig them out in September and again in April or May. In September, because if left later they will do much damage. But some are at this time so small that they will escape notice, and hence the necessity of a further search in April. Ashes do not prevent egg-laying; the carbolic acid and soap mixture will. This should be rubbed on the base of the tree in July. I have but little

doubt that the kerosene and soap mixture, placed underground close to the tree, would kill the larvæ, though I have not tried it.

NEW REMEDY FOR PHYLLOXERA.

The discovery made recently by Mr. John A. Bauer of San Francisco promises to become of great importance to grape-growers everywhere, as the substance used is cheap, and is said to be effective and to protect the vines for many years.

His remedy is half an ounce of quicksilver, mixed in particles too small to be distinguished under an ordinary microscope with an equal weight of pulverized clay, in the soil of the hole in which the vine is planted. The cost for the mercury, at the present price is a little more than a cent for each vine, or from \$7 to \$10 per acre.

THE NEMAHA BLACK RASPBERRY.

for this class I intend to say a word whether it availeth any thing or not. If their term of tenure is short or uncertain—so much so that they feel that they would not occupy their present positions long enough to enable them to reap an adequate return for the cost and labor of planting trees, let them try small fruits. The tenants family usually fares slim with regard to fruits and vegetables—a state of things that is not at all necessary, even if they do occupy the land of another. Long terms of renting are coming more and more into vogue now-a-days, which will enable the tenant to do much better by himself and family, in the way of producing a supply of fruit. Landlords are usually willing, too, to bear their share of the expense of starting an orchard

The Flower Garden.

WINTER.

From out his robes the snow he shook,
His path of storms to trace,
To bind in ice and chiming brook
Whose bank the birds long since forsook,
Bold winter came apace.

His frown is in the cold, gray cloud,
In storms his voice outbreaks,
His hand is on the woodland proud,
When in the tempest fierce and loud,
The creaking forest shakes.

Hark! in the moaning winds he sings
A requiem, sad and low;
To Nature's perished form he brings,
And over it in silence flings,
A winding sheet of snow.

He breathes upon the yielding lake
The gentle winds no more
With their soft breath the ripples break,
Nor can the wildest tempest shake
The glittering crystal floor.

In sheltered homes, by genial fires,
Let love as warmly glow
For Him whose wisdom still inspires,
Whose bounty fills the heart's desires,
And shields us from the snow.

And though the winter's hand be strong
On dale and hill and plain.
Although in storms he sweeps along
And hushed is every streamlet's song,
He cannot always reign.

The sun with gentle beams shall chase
His icy bonds away;
So Error, boasting pomp and place,
Shall fly before the kindling face,
Of Truth's resplendent day.

SEASONABLE HINTS.

Catalogues.—To the true lovers of flowers the study of a good seed catalogue is no small enjoyment. While reading the descriptions of the various kinds, and marking this or that to be ordered, his mind's eye wanders in the prospective garden among the beauty and fragrance that is to be. Those who look at first class catalogues as mere price-lists are surely not aware of the vast amount of valuable information contained in them, and the labor and skill that has been bestowed upon their publication.

Our advertising columns contain the advertisements of nearly every first class seed house in the United States, and we advise our readers to send for these catalogues now, mentioning that they saw the advertisement in the AMERICAN GARDEN. This mention will insure prompt attention and may benefit not only the sender, but the seedsman as well as ourselves.

Muck, as found in many swamps and low places throughout the country is of more value in the flower garden than is generally supposed. We have seen such astonishing results from its use as a mulch for flower beds, that, under certain conditions, we consider it as valuable as manure. But there is a difference in muck, and it should never be used fresh directly from the swamp. In many localities muck may be dug during winter, and where circumstances are favorable, the gardener whose soil is not already very rich in vegetable matter can hardly make a better investment than to secure a plentiful supply of this material.

DESIRABLE NATIVE CLIMBERS.

Not the least attractive part of a garden would be an arbor trellis covered with a collection of indigenous climbers, many of which are highly ornamental and not less beautiful than some of the tender foreign species which require considerable care in their culture. Among the best are:

Clematis Virginiana, Virgins Bower. A doubly desirable climber on account of its profusion of white flowers in midsummer and the curious and ornamental tailed fruit on the pistillate plants in autumn. The foliage is firm and copious. The vine makes a beautiful covering for an arbor. Care should be taken to secure both sexes of the plant. In some localities the hairy fruit has given the plant the peculiar name of "Old Man Vine."

Adumia cirrhosa, Smoko Vine. The most delicate and graceful of our desirable climbers. It grows well in a rich shady place among shrubs. The Dicentra-like flowers are very pleasing.

Celastrus scandens, Wax-work, False Bitter-sweet. The unique autumn fruit of this high climber will always make it attractive. It is commonly dioecious. In rich land, among trees, it is to be recommended.

Echinocystis lobata, Balsam-Apple. Much cultivated westward under the name of wild Cucumber. Very desirable for training over stumps and bushes.

Tecoma radicans, Trumpet-flower. A well known and well tried root climber, much prized for its hardness and very large trumpet-like flowers.

Calystegia Sepium, Bindweed submits readily to removal and adds to the list of herbaceous twiners another desirable species. It is scarcely excelled by the Morning Glory. A double variety.

Aristolochia Siphon, Dutchman's Pipe. A robust vine with remarkably large and heavy leaves. It is hardy in Massachusetts. Over porches it gives a dense shade and presents a tropical appearance.

Humulus Lupulus, Hop. If any vine is neglected it is the Hop. It is commonly associated with bare poles in the Hop yard. The clean and careless habit of the vine as it clambers over trees and bushes, its pendant balls of green and yellow, and its disposition to take care of itself, should endear the Hop to every lover of the beautiful.

Apios tuberosa, Wild Bean. This is a perennial herb, bearing edible tubers on underground shoots, in its wild state twining and climbing over bushes and fences. Its brownish-purple flowers are very fragrant, and are borne in dense and short, often branching racemes. This is an elegant climber, nearly allied to the Wistaria, and well worth a place in every garden. **

THE MIXED BORDER.

This is the oldest style of flower-gardening; in it each plant stands on its own merits, and is not planted for its effect in a mass. It is, says George Wootson, what is known as the "old-fashioned" style of gardening, in which plants are set and cared for for the love of them. In this all classes of plants find a place, including perennials of all kinds, biennials, annuals, tender plants from the greenhouse and window, and even low shrubs. Because the contents of such a bed are varied, it need not be

without order; if it is surrounded by a path, then the taller-growing plants are placed in the center, with the lowest at the edges, and those of intermediate height between; if the path is on one side, only then the tallest plants should be at the rear. Each of these different styles of gardening has its place, and it is not necessary in advocating one to decry another, as each is best suited to particular localities and circumstances. In advocating the mixed border, we merely claim that it will meet the wants of more people in moderate circumstances, than any other kind of flower-gardening. And those who really love flowers, as individuals, can take more pleasure in cultivating them where they can reach their full development than when they are crowded into a mass, to produce a particular effect of color.

NICOTIANA AFFINIS.

This new ornamental Tobacco has given me about as much pleasure as any novelty I have ever tried. Its cultivation is of the easiest kind, and the stately habit of the plant, combined with its large pure white flowers, opening in the evening and emitting a most delicious, tuberoso-like fragrance, should make it a favorite everywhere. It grows to a height of from two to three feet and should therefore not be planted too near the border of beds. For its full development it needs plenty of room and rich soil.

As an experiment I planted one of the young plants in a two inch pot, repotting it several times into larger ones up to a ten inch size. In this it attained perfection, producing flowers freely and presenting an exceedingly handsome appearance when fully grown. I never had a plant that attracted so much attention from visitors as this one; and for decorating rooms or halls at evening entertainments nothing could be more appropriate, as the flowers remain in full beauty all night, dispensing their delightful fragrance. N. T. LACKNER.

SELECTING ROSES.

Like most novices, states Capt. Moore, I began with planting a great many kinds, my information concerning them being what I could get from nursery catalogues and the few works on the Rose, which told all about their good qualities, but none of their bad ones. The latter I am constantly finding out from experience, and though costly, the knowledge will be useful in future plantings. I consider hardness, vigor of growth, beauty of form and color, fragrance and constancy of bloom as indispensable requisites for a hybrid perpetual Rose for general cultivation in the garden. It is hard to find all these qualities in any one variety, but the nearer any one comes to them the better the general cultivator will be satisfied with it.

FASHIONABLE FLOWERS.

The Hinsdale Carnation is considerably used for young ladies' luncheon parties; and so is the lovely Grace Wildor Pink. Bon Silone buds are in high favor for the luncheons given by debutantes to their young friends. A bed of these buds forms the center piece, and the favors of this same rose are bound with pink satin sashes, so as to allow the foliage on the long stems to full below the waist when the bunch is worn upon the young lady's dress.

PENTSTEMONS.

The genus *Pentstemon* is a large one including about seventy-five species which are all exclusively North American with the exception of one Northeastern Asian species. Nearly all are showy, and many of them have been largely grown both here and in Europe. Three species and a well-marked variety occur in the Northern United States east of the Mississippi. These are *P. pubescens*, *P. laevigatus* and its variety *Digitalis* and *P. grandiflorus*. The flowers of the Pentstemons are long, tubular, often bell-shaped, and commonly borne in long racemes. In color they are various shades of purple and red, occasionally varying to nearly white and of considerable brilliancy.

Unlike most of our western herbaceous perennials the Pentstemons thrive well in cultivation in the East. Many of the species have been grown in botanic gardens and on the grounds of amateurs, but with the exception of two or three, they have not become generally popular. The reason for this lack of favor may lie in the fact that many of the species are half-hardy and require cold-frame protection during winter, and perhaps also in the fact that most of them require a yearly renewal to insure a satisfactory bloom from season to season.

The perfectly hardy showy species with which I am acquainted are *P. laevigatus*, var. *Digitalis*, *P. barbatus* and its variety *Torreyi* (*P. Torreyi*), *P. diffusus*, *P. ovatus* and *P. pubescens*. Mr. C. M. Hovey finds *P. Palmeri* and *P. heterophyllus* hardy at Boston.

The var. *Digitalis* has been growing in the Cambridge Botanic Gardens for forty years. It is one of the finest of showy perennials and its white and red-striped large flowers which are over an inch long, entitle it to a place in every garden in the land. This fine plant occurs wild frequently in Illinois.

The longest cultivated of the Pentstemons is *barbatus*. The flowers are borne in profusion; they are an inch long and conspicuously two-lipped, varying in color from light pink-red to crimson. This species was grown in England seventy years ago. The first of the garden forms were obtained from Northern Mexico, but of late years it has come to our gardens from Colorado and New Mexico. It is a variable species, one of its most ornamental forms being the var. *Torreyi* which was long held to be a distinct species. This variety differs from the species proper in its greater size and deep red flowers. It is a showy and desirable plant.

P. diffusus was early found on the Columbia River by the adventurous Douglas and it has flowered in England as early as 1827. The flowers are comparatively small, but are borne in such a thick cluster and are so decided in their colors as to produce a fine effect. The species is easily propagated by rooting its decumbent stems.

P. ovatus was also first discovered by Douglas on the Columbia River about one hundred and forty miles from the Pacific ocean, and by him it was introduced into England in 1826. It is a tall species producing an abundance of rather small flowers which are deep purplish-blue in color. On account of this deep color of the flowers it is one of the most desirable of the species.

P. pubescens is the common eastern species occurring on dry banks from Canada and Connecticut to Iowa and south to Florida. Although less showy as individual specimens than the preceding species it has many advantages. Being a native of the Eastern States it endures our climate, and it readily becomes naturalized on dry and rocky banks. One of the prettiest sights I ever saw was a neglected clay cliff colonized with this plant

transferring them to the house in February. During the following summer they may give a few flowers, but the second summer they will bloom profusely. Many growers sow the seed under glass in March, but the plants do not become so strong as when started earlier. Seeds may be started in January or February and excellent results obtained. After the first full flowering the bloom will dwindle and it will probably not prove satisfactory. It is therefore advisable to start new plants every year to keep up the succession. They may also be propagated by layering.

All the Pentstemons are worthy of cultivation and more general attention. As a specialty for the amateur floriculturist there is hardly another genus of plants more inviting, and the beauty and profusion of their flowers will prove ample reward for the care given.

L. H. BAILEY, JR.

A FLOREBUND DAHLIA.

Noting in my garden last autumn a Lilliputian Dahlia exceedingly full of flowers and buds, writes John A. Lord, of New Jersey, I took the trouble of counting them, when I found two hundred and twelve flowers and well formed buds. The flowers were very double and perfect, and the plant I had raised from seed sown in gentle heat on April 8th. It had been in continuous bloom since the last of July and formed one of the most attractive objects in my garden full of favorites.

ONE HUNDRED THOUSAND OBEY-SANTHEMUMS.

To what extent the so-called "Chrysanthemum craze" has reached will be better understood by figures than anything else. A single firm near New York has sold during last year one hundred thousand Chrysanthemum plants of various sizes, and this is probably not one half of all that were sold here, the aggregate of which amounts no doubt to not less than a quarter of a million of plants. A few years ago, it would have been difficult to dispose of ten thousand Chrysanthemums in the whole United States.

THE PEARL TUBEROSE.

For greenhouse culture this variety, or sport is far superior to the common Double Tuberosc, in out-door culture however it has been observed that it does not always perfect its flowers as well as the older kind; the experience of our correspondent Wm. M. Bowron of Tennessee, which seems to indicate a remedy for this defect, is therefore worthy of consideration.

I find, he says, that Pearl Tuberoses will open fully and be a perfect success when grown in partial shade. In the hot sun they become shabby before all the flowrets open, while in partial shade every bud on the spike opens—at least in our climate.

THE PENTSTEMON.

Several square rods where scarcely anything else would grow well were made showy by this common Pentstemon. The flowers are a delicate violet-purple.

The desirable Pentstemons which are to be treated as half-hardy perennials are numerous, and among them are to be found our most showy species. In England many of the Mexican species are grown, but they have met with less favor here where less attention is paid to floral gardening. The species which are commonly grown in this country are *P. glaber* (*P. speciosus*), *P. grandiflorus*, *P. secundiflorus*, *P. confertus*, *P. venustus*, *P. gentianoides*, *P. Cobaea* and *P. centranthifolius*.

The best results are obtained from these half-hardy species by sowing the seed under a frame with little heat in December, and

The Window Garden AND GREENHOUSE.

WINDOW GARDENING FOR FEBRUARY.

Now as the days are growing longer, warmer and sunnier, plants will begin to grow and blossom more freely than they did in midwinter. Pinch in Fuchsias, Heliotropes, and others that are growing too tall or spindly. Increase the supply of water as growth and the drying influence of sunshine and warmth demand. Be vigilant and spare no insect pests. Ventilate freely in mild and sunny weather, but avoid drafts, and in ventilating do so gradually. Ventilate early and close up early. Abutilons, Marguerites and some others that have filled their pots with roots will need a little extra nourishment, give it in the way of weak liquid manure, or better still, pick out some of the surface earth from the pots, and replace with equal parts of turfy loam and rotted manure.

REPOTTING PLANTS.

Many of your plants for flowering as Tea Roses, Petunias, Fuchsias or Geraniums, if in vigorous condition, and those kept to furnish cuttings, for instance Coleuses, Salvias and Ageratums, may be the better off for a shift; but if you will have no room for them after they should be repotted, better leave them undisturbed. If you have room and convenience for them you may shake out and pot single, the cuttings of Heliotropes, Ageratums, Coleuses, Iresines, Geraniums and other summer decorative plants that you have wintered—a bunch of cuttings in a pot—but if you cannot yet take care of them leave them alone till March when you may find relief in a hot bed or cold frame.

In repotting plants use clean washed pots only, and more particularly than the outside let the inside be clean. Drain the pots with some rubble, as broken pots, brickbats or rotten stone pounded small, and over that strew thinly some of the roughest of the soil on half rotted leaves to prevent the earth from clogging the drainage.

SOIL FOR POTTING.

Turfy loam piled up for about a year, and well rotted manure are the principal material, but never hesitate for want of any particular kind of earth. Wood-soil is capital when mixed with loam, so is leaf mold, but do not use fresh muck or peat from a swamp. Some gardeners use a great deal of sand in their soils, but I fail to find much good in it if the loam is turfy and leaf soil or light manure is mixed with it; in fact for the ordinary house plants as Geraniums, Fuchsias, Carnations and the like I don't add sand.

Break up fine all the lumps in the loam, they are clay balls and worm casts, and in their unbroken state fine roots cannot derive benefit from them; don't think they are fibre lumps and will keep the soil open,—fibre lumps are unmistakable and if large need to be torn apart or chopped up. Never use soil that is wet or muddy, nor fresh or pasty manure. Cow manure from the heap is seldom fit to use before it is two years old on account of its plastic nature. Palms, Callas, Crinums, Amaryllises and other fleshy rooted plants delight in fresh loam, as thin cut sod chopped up fine. Roses like strong heavy loam. Azaleas, Heaths, Cy-

tisus, and others having fine fibrous roots thrive the best in a rather light soil.
SOWING SEEDS.

Sow some seeds of *Vinca rosca* in a warm room. You will like the variety having white flowers with red eye the best, and in order to have good blooming plants to set out in May, you must raise your seedlings early. Sow also Verbenas, Centaureas ("Dusty Millers"), yellow Feverfew and Torenias. In sowing small seeds as Torenias, Lobelias, Begonias and the like I have known amateurs to dust the seeds on the surface of their Fuchsia and Geranium pots, and in this way raise a fuller crop than when they took every precaution to prepare separate pots for them.

While it is well to start early the above slow growing kinds in order to have strong plants by planting out time, it is far too soon to sow Stocks, Asters, Marigolds, Zinnias and the like. You may sow Cyclamen, Amaryllis, and other tender perennial plants as soon as you wish, provided you have heat to start them in. And you may sow Columbines, Larkspur, *Pyrethrum roseum* and other perennials as soon as you please if you are prepared to take care of them. The *Pyrethrum* and Larkspur will blossom the first year from seed, but notwithstanding oft written statements to the contrary *Columbines will not blossom the first year.*

GLOXINIAS AND AMARYLLISES.

If you have some old plants at rest and they are showing signs of growth bring a few of them to the light and give them a little water; do not force them but let them come along slowly. The same with tubercous Begonias. But do not start the colored-leaved Caladiums or the pretty flowered Achimenes before March or April. If you would like some lovely Gloxinias from July till September, sow some seed before the end of March, keep the seedlings near the light, prick them off singly and about an inch apart into pots or boxes, and, about the end of May, plant them out in a cold frame or old hot bed.

CUTTINGS.

Propagate from cuttings all the plants you can—Geraniums, Fuchsias, Carnations, Coleuses, Verbenas; stick the cuttings into the soil on the shady side of the pots the large plants are growing in, some may die but many should live. When these cuttings are rooted pot them by themselves or put them into shallow boxes. Or you may fill small or medium-sized pots with sand or sandy soil and dibble your cuttings firmly into them, and place them in a warm shady window and away from draft. Keep them moist but not wet.

WM. FALCONER.

SUCCESS WITH HOUSE PLANTS.

It is often asserted by amateurs in floriculture that some witchery or knack is necessary to be successful with house plants, which is not possessed by them. There are apparently many persons who seem to take little pains with their window gardens, yet whose plants thrive excellently and bloom throughout the season; while with others, who are continually fussing over the growth in their windows, and perchance coddling it too persistently, the result will be yellow leaves and never a flower. It is well to remember that housed plants are very much like infants,—they are entirely dependent

for their well being upon the judicious care of those who nurse them.

Ladies very often fill their windows with fine plants and then consign them to the tender mercies of the parlor maid, with instructions to water occasionally, and possibly, to give them a breath of fresh air once in a while. As a matter of course, the poor things will become sickly and pine away, when their owner will wonder "What ails them," and will probably declare she "Has not the gift of making plants grow." Now common sense, careful judgment, and only a little attention daily, is requisite to have windows full of bloom and stands covered with healthy, thrifty plants. Those who do not love them well enough, however, to give them personal care need not expect to keep them in first rate condition.

SELECTING PLANTS.

Do not expect too much of plants. You may purchase one that is just entering upon its season of rest, when nature requires it to remain dormant. If it shows no inclination to put forth the new shoots, all that is to be done is to keep it clean and water it moderately. During its period of rest, the plant needs much less water, than when it is active.

Frequently plants are purchased just as their foliage is at maturity, when within a short time they will wither and droop. This is particularly the case with *Adiantums*, or Maiden-hair Ferns, which are the finest just before their fronds shrivel. A lady brought to a florist the other day the most pitiable looking *Adiantum cuneatum*, which she had purchased but a week before, when its quivering wiry stems, hung luxuriant with rich green lacy foliage. She indignantly inquired if "that was the kind of plants he kept." Like many others selecting *Adiantums*, she had picked one out for its beauty when just at its full maturity. Very soon its leaves began to turn, when it drooped, and certainly presented a most dejected appearance. Had its owner but cut off the limp fronds and borne patiently with her Fern, in a few weeks it would again have uncurled fresh fans of foliage to tremble with every wave of air.

AIR AND MOISTURE.

Fresh air, and moisture all plants must have, and the majority of them will not thrive without light and sunshine. House plants are generally kept too warm. A temperature from 55° to 70° is better than warmer for the varieties usually cultivated in windows. Give them air, but never expose to a draught, which is disastrous. If fresh air can be admitted from an adjoining room, it is safer than to open the windows at the top. Never lift them from the bottom in winter. As a rule house plants suffer from a lack of moisture in the atmosphere; this is especially true when there is furnace heat and gaslight. It is a very good plan to set pans of water on the plant stand, and to fill vases in the room with water. This makes a healthier atmosphere for people as well as plants. It is often the case that the only person in the house will have blossoms on her plants will be the cook, whose windows will be gay with Roses and Geraniums, because the steam from the boiler and kettles will provide the moisture needed by the plants in the kitchen windows.

It is an injurious habit to pass among the plants daily with a watering pot, and drown

them out. The best guide to their demands in this regard is the soil, which should be thoroughly wetted when dry. Watering should not then be repeated until the indications are that the plant is thirsty. But speedily give the drink asked for then, as one day of drought will set back growth and bloom. The water used should be of the temperature of the room, otherwise the plant will be chilled and injured by the too sudden change of temperature.

CLEANLINESS.

It is highly important to keep the foliage of plants clean, not alone for their beauty, but for their health's sake. Wash the leaves inside as well as outside, as often as they are dusty. A soft sponge and tepid water are the best for this purpose. To polish Ivy leaves, or those of Palms and Rubber trees, use soft tissue paper; but rub lightly or the leaves may be injured; it will make them like satin.

Every day pick off any dead leaves or twigs, as these but interfere with the strength of those alive. Blossoms should not be left on too long; they retard the perfect formation of others. Never permit bloom to wither on the stem.

Newspapers should be pinned about plants when rooms are swept to protect them from the dust. They can be shielded from cold in this way, if the fires get low on occasions of severe nights.

Stirring up the soil in pots will contribute to the well being of plants, but care should be observed not to dig down too deep and wound the roots.

FLORA.

BOUVDARIAS.

As window plants Bouvardias deserve more general attention of amateurs than they receive, as they are easily grown, and, with but little care, make as attractive window ornaments as any plants I am acquainted with.

Commencing in the fall with strong healthy plants potted in six or seven-inch pots, having for soil a mixture of good turfy loam and stable manure thoroughly decomposed and well mixed together—the best soil for nearly all house plants—they should be kept in a warm room, and fully exposed to all the available light from a sunny window. Yet I know a lady who keeps her Bouvardias in a room in which the temperature is never very high nor the light very bright, nevertheless her success is excellent. And although her plants do not bear as many flowers as they would if kept in a warmer room, the flowerets and trusses are much larger, last a long time in perfection, and, as they are not grown for cutting purposes, but for the ornamentation of the room, they give under this treatment as much satisfaction as any class of plants I could name. Insects do not attack the plants much under this treatment; sometimes the green fly may appear, but this can be easily removed by syringing.

Be careful not to over water; while the plants when growing vigorously, require plenty of water on all clear days, too much, by allowing them to stand in saucers filled

with water, is slow but sure death. The rootlets, being very sensitive to being kept in standing water, soon rot, and it is difficult to recuperate Bouvardias when once they get into an unhealthy condition. An occasional sponging of the leaves is beneficial, also a little ammonia water when they show signs of exhaustion.

As the plants cease flowering in early spring allow them to get rather dry at the

pink—President Garfield, are beautiful and well worthy of culture by all flower lovers, and the new scarlet—Thomas Meehan, will probably prove alike suitable, but not having tested it yet I cannot confidently recommend it.

Bouvardias are generally propagated by cutting up the roots into pieces about an inch or so long which are placed in the cutting bench. Shoots from adventitious eyes start soon and form young plants. This is by far the easiest and best method of propagation for this class of plants. At the time of the introduction of the double forms it was supposed that when propagated by this method, they would not retain their true characteristics, reverting to the single form, and that the only method of propagating so as to retain their double character would be by using green-wooded cuttings. This is not the case however as the varieties—Alfred Neuner and President Garfield can be propagated from root cuttings just as easy as any of the single varieties, and come true every time. The scarlet variety—Thos. Meehan—although I have not tried it can also be propagated in the same manner. The best single varieties are Davidsonii—white—Elegans—pink; and Leiantha—scarlet.

MANSFIELD MILTON.

DOUBLE BOUVDARIA.

roots, then cut all the shoots clear off within two inches of the surface of the soil. They will soon start into growth, and if wanted to bloom in the flower garden during the latter part of the summer, let them grow without pinching the points of the shoots off. About the first of June plant out in a well enriched bed and they will give an abundance of flowers for several months. Small plants raised from the cuttings in spring do not give much satisfaction for summer blooming,

POINSETTIA PULCHERRIMA PLENISSIMA.

and this is one of the reasons why Bouvardias are not more cultivated than they are for this purpose, while old plants cut back and allowed to make an unrestricted growth always produce good summer flowering plants. For winter blooming, however, these young spring grown plants are most desirable.

There are single and double varieties of the different colors now in cultivation. The double white—Alfred Neuner, and double

For gorgeous, showy effect at this season of the year the Poinsettia stands preeminent. The genus is named in honor of Joel R. Poinsette, American minister to Mexico.

Poinsettia pulcherrima plenissima, represented in our illustration, much reduced, is a magnificent plant of comparative recent introduction, remarkable for the distinct character of its floral bracts, the size of the heads in which they are produced, and their marvelous brilliancy of color. Its bracts are gathered into clusters which fill up the center, so that the whole inflorescence is full and rosette-like in form.

The Poinsettia, says Peter Henderson, is of the easiest culture. After flowering cut back to within two buds of the old wood, take up the plants, and put them in a convenient place under a bench, and cover the roots with sand or earth, and keep dry. Let them remain until it is time to plant out ordinary bedding plants, when they should be put out in the open air, and planted in boxes six inches deep,—say six plants in each box—a foot or so apart, giving them good rich soil.

They should be taken into the house before the nights begin to get cool, in the latitude of New York by the middle of September. They may be grown to flower in these boxes, by giving them plenty of manure water; although, if wanted in large quantities, it is best to place the boxes on a greenhouse bench, knock off the sides and ends of the boxes, and fill up to the level between with soil. After the plants have become thus established, an occasional watering with liquid manure will add greatly to their growth. At no time should the temperature in the house fall below 50° at night or 70° during the day.

POINSETTIAS.

Lawn and Landscape.

FLOWER BEDS IN LAWNS.

The beauty of all bedding plants is best seen from above as the flowers or brightest shoots are on the terminal branches. The English have a way, to use a trite saying, of eating their cake and keeping it at the same time, in the arrangement of their large lawns. At a distance of a few hundred feet from the house a ditch is dug. The side next to the house is nearly perpendicular and deep enough so that a sheep can not leap over it. The other side is a gradual slope and this slope and the perpendicular sides are seeded to grass. Beyond this ditch, sheep are pastured adding interest to the landscape and keeping the grass closely cropped. From the house only a broad expanse of lawn is seen with no interrupting fences.

A similar method of deceiving the eye may be practiced in making flower beds. By placing them on the outer borders of the lawn and sinking the nearest edge six or more inches below the lawn, the eye beholds only flowers, instead of stems and newly worked soil. In this way long-legged Geraniums may be made to ornament, instead, as is generally the case, to detract from the beauty of the lawn.

To one who purchases each year the bedding plants he uses, this suggestion will have less force than with those who prefer to save their Geraniums and other plants from year to year. But there are benefits in sinking the edges of any flower bed so that the foliage of the newly set plants just touches the grass. It presents a finished appearance from the start, is less liable to injury from passers-by and more readily presents its beauties to the eye.

A natural and beautiful example of a sunken flower bed may be seen in any bog where the Cowslip flourishes, especially along side of railroads where the grass undisturbed by cattle shapes itself into tussocks, between which the Cowslip—naturally an aquatic plant—flourishes without becoming drawn up. In the spring after March fires have burned away the dead and frozen grass, the Cowslip springs up, just filling the little depressions with its rounded outline and bursting into full bloom, becomes one of the most beautiful objects imaginable—golden gems upon a cloth of emerald velvet.

How to protect flower beds in the lawn or garden from the intrusion of fowls is an important question with many amateur florists. Any wire arranged in the shape of a low fence around the bed is better than a fringe of sticks or paving stones, but as usually constructed in our public parks they detract grievously from the appearance of the flowers. Chickens and turkeys will not go where their walking is not tolerably plain, a simple net work of wires is therefore sufficient to protect flower beds from their incursions. The meshes may be three or four inches wide and the plants placed through them. The wire will prevent the chickens from wallowing among the plants and making thoroughfares beneath it, while the foliage of the plants will soon grow large enough to cover and hide it from view.

L. B. PIERCE.

KEEPING HEDGES.

One of the principal objections urged against the employment of live fences, or hedges is the cost of keeping them in efficient repair, for it admits of no qualification that unless they receive proper attention they will prove to be of but little value as a fence against live stock. Unfortunately our best hedge-plants, so far, says Wm. Saunders, are of strong growth, especially when young; and consequently require to be trimmed two or three times during summer, at least for several years after planting, so that in a vast number of cases the hedge is neglected and soon ceases to be serviceable.

The best hedge-plant is one that could be kept by winter trimming only, because in that season of comparative leisure it would probably receive attention, but with such strong-growing plants as the Osage Orange and Honey Locust, our two popular hedge-plants, it is impracticable to produce a close fence without frequent summer trimmings. There is one thing, however, which should be put to their credit, that after a few years, the growths will be less profuse; the weakening effect of continued summer pruning ultimately weakens the plants, so that they become easier managed. This also prevents them from sending out their roots to a great distance, so that they do not interfere with cultivated crops, an evil which soon becomes visible when a hedge is neglected and allowed to take care of itself.

When a hedge gets into a condition that one summer trimming and one winter trimming will keep it in a fairly good condition, the labor and cost is reduced to a minimum. It will also have a tendency to retard the exuberance of early summer growth, if the winter trimming is delayed until after the buds begin to push in spring. This will make a difference of several weeks in regard to summer trimming, and will prove of some importance when summer pruning is confined to one operation.

The weakest part of a hedge is always nearest the ground; the criterion of a well-kept hedge is that of thickness at the bottom; this should also be its widest part, and it should taper upwards to a point. Unless this form is strictly maintained the lower branches will gradually weaken and ultimately die out, leaving gaps which are not easily closed. Hedges which become weak and full of gaps through neglect may be renewed by cutting them down in winter to within eighteen inches or so from the ground; the plants will then branch out vigorously, and by proper pruning, soon be all that need be desired for a fence.

HARDINESS OF MAGNOLIA GRANDIFLORA.

Unquestionably the most magnificent broad-leaved evergreen tree found in North America is the *Magnolia grandiflora*, grand not only in the exquisite beauty of its flowers, but also in the rich luxuriance of its foliage, as well as in the majesty of its form.

The tree is a native of the Carolinas and the South West, and is generally not considered hardy north of Washington, but Major P. L. Treas states in the German-Lowland Telegraph that he has a specimen of the very same pure right in his lawn in Philadelphia, and that it is not only himself who has this most magnificent of the whole Magnolia family in full health and glory upon

his premises. Besides being grown in several of our nurseries, there are several yards in this city in which it is grown to perfection; hence, we see no reason why it should not be seen as frequently as the Lilac or Snowball.

"The objection urged against it that the tree requires careful sheltering in winter," says the writer, "is a mistake. It needs none whatever, so far as we know. Ours was entirely open to a northern exposure, and, as it had passed through several winters, as severe as any experienced, without the slightest damage, is sufficient proof of its hardiness."

"It is fully fifty years ago that we saw the first tree of this Magnolia and desired to try our luck with it, although made to understand that it was not recommended for outdoor culture in our latitude. The small plant that we had secured grew very slowly and we became quite impatient in waiting for it to bloom. We learned, however, that it was very slow in flowering when the tree was not grafted and grew upon its own roots; but we also found that when it began to bloom it never missed a season, and that it was far hardier than when grafted. It is still standing, now for over forty years, and is apparently vigorous, having borne a partial crop of flowers the past season. We think we can therefore say quite confidently that the *Magnolia grandiflora* is hardy in Philadelphia, and that we should like to see a specimen upon the grounds of every gentleman who can appreciate one of the most beautiful floral sights in the entire catalogue."

IVY LAWNS.

In our country with its frequent summer droughts, and severe, snowless winters, Ivy does not thrive as well as in the mild, moist climate of Great Britain, and Ivy lawns are therefore known to but few among the many who are interested in gardening economy. They consist, as the name implies of Ivy only, and they offer some peculiar advantages in cases where grass lawns are apt to occasion more trouble than they are worth to the builder.

According to the Farmers' Gazette (Dublin) an Ivy lawn may be well made in one season, and if the primary operation of planting be properly performed the lawn will make itself; it will want no cutting, no sweeping, no watering, no protection from the birds that eat the grass seeds to-day, and tomorrow scratch up the tender plants, as though it were their mission to make grass lawns impossible. And when made, being, as it were, self-made, an Ivy lawn will take care of itself for any number of years; but if in need of repair or trimming, the knife, the shears, or the spade may be used with unskillful hands, and with the least imaginable cost of time, for it is not an easy thing to kill, or even to seriously injure, a lawn consisting of Ivy solely.

FRUITING SALISBURIA ADIANTIFOLIA

This beautiful coniferous tree, commonly called Ginkgo, Maiden-hair Tree, fruits so rarely here that it has been believed that it could not bear fruit on account of its being dioecious and there being no male plants in this country. However, this may be, Miss Elizabeth G. Knight of the Normal College, states that the tree fruits abundantly each year in the New York Central Park.

Foreign Gardening.

FRUITS OF THE AMAZON.

We have said in a previous paper that no berries such as we so call in the United States, are found in the Brazilian forest, and that any one lost therein would probably starve to death.

These statements are strictly true, but nevertheless there are many edible wild fruits, some of wide distribution, others found only in a very narrow limit. These are mostly the fruits of large trees and can only be obtained by cutting down the tree, often from its size a work of great labor, or by gathering the fallen fruit, but the monkeys and birds in this are usually beforehand and a wanderer would run little chance of obtaining any.

One may walk days through a Brazilian forest and find no fruits, or see no sign of animal life and yet the woods may be full of both. There is another world, if we may so call it, different from that in which he walks. Far in the air in the tops of the great trees, so tall that only with a good glass can one see the flowers or the shape of the leaves. Of this upper realm one gets a reminder in the stray feather of a bird or some fallen flower or fruit, in a delicious perfume wafted from thousands of unseen flowers, the chatter of parrots, the song of birds, or the angry cries of the monkeys, but practically it is an unknown region and must ever remain so.

The time of the ripening of the wild fruits is well known to the Indians and at the proper seasons they go to the trees to gather the fruit by climbing, or to await its falling to the ground. Of these fruits there is so great a variety that we can only describe a few. Of many we have been unable to ascertain the botanical names and to the whites they are only known by the Indian names. Most are very distasteful to the strangers, but some few are very nice.

MUNGABA.

The fruit of *Hancornia speciosa* is rightly considered one of the most delicious of fruits. This tree which is found in the Amazonian delta and down the coast, and is not known in the interior, is very beautiful resembling a weeping Birch. The sap is milky, and hardened produces an inferior quality of rubber; the fruit is roundish or oblong with a skin as thin as tissue paper, about the size of a small Fig and ripens in January. It is green, yellow, often with a red cheek, full of a melting pulp, of indubitably delicious flavor; the seeds are flat, of a brownish color, covered by a closely adhering pulp. In Peru the Mungaba is chiefly brought from the great island of Marajo, where the tree grows wild in great quantities. It is brought in long pockets made of Palm leaves which contain about two quarts which sell at the equivalent of from five to fifteen cents each; we have never seen the tree in cultivation, but seeds thrown on the ground in our yard soon produced plants.

BACOUSY.

Another fruit also from Marajo, which is the immense island which separates the mouths of the Amazon. Botanically it is *Platonia insignis*, a very lofty tree with noble

foliage and large pink flowers. The fruit is somewhat oblong, the size of a large Apple, has a hard shell which contains from two to four large berry seeds covered by a fragrant pleasantly acid white pulp. It is very good but the proportion of pulp to seeds and shell is very small; the shell however, is often made into a very rich preserve. This fruit is not found in the interior, as far as we know; there is however a fruit of the same name but smaller, of two kinds, of which the pulp is sour, called *Bacouze cusná* and *cinua* which is found on the middle and upper Amazon; it appears to us however to belong to another family the fruit only being similar in form.

GUAGERA.

This is the fruit of *Chrysobalanus Icaco*, sometimes called the Cocoa Plum; it is the shape and size of a large round Plum, bright yellow with white flesh, sweetish but with a rank disagreeable smell. It is usually eaten boiled for it is very astringent raw, but in either way one taste usually suffices the stranger.

E. S. RAND.

(To be continued.)

THE CHRYSANTHEMUM AT HOME.

The idea of turning the Chrysanthemum into a vegetable may seem a startling one to many of our readers, yet the following extract from a private letter from Mrs. M. L. Hopper, a young botanist and artist, who has been in Japan for several years past leaves no doubt that the "Goldeu Flower" is actually eaten by the Japanese, and who knows that Chrysanthemum Spinach may not be among the "novelties" of another season.

"Mr. Tsuda took me to a garden to see some Chrysanthemums," writes Mrs. Hopper, "I was quite mistaken in calling any of them China Asters in a former letter. Some of the kinds look exactly like the China Asters we have at home; but they are all Chrysanthemums. Mr. Tsuda says there are over five hundred varieties. Some are the size of the end of my little finger, and yellow; then some are a little larger, of a beautiful cardinal red; and still others a little larger, white, pink etc. The medium-sized ones are nearly all yellow, and these are the ones the Japs eat. They pickle them, and eat sugar or Shoyu (Japanese sauce) on them. The green leaves they boil, as we do Spinach.

"The large flowered ones are very fine, and of beautiful colors; the petals are very long and curled around. They look like pin wheels going around very fast. Each stem is trained on a stick. On those I saw there were fifteen flowers in each group. The five front ones were rather short; the next five a little higher, etc.; but the flowers all belonged to one plant, fifteen flowers to each group, seventy-five flowers to a plant. Most of them are of two colors: yellow and red, red and tan color, red and cream, etc. One side of the petal is one color, the other side of the petal another.

"Although these flowers and some others in Japan are very fine, I do not like Japanese gardening. I like a fresh green field, with some cows grazing in it, a few fine old trees, and some wild flowers, far better than a Japanese garden. The Japs call grass 'weeds,' and they will not let a bit of it grow; pull it up and throw it away. In the place of grass in the gardens they put gravel. There are no green fields in Japan,

for one reason that most of the country in the interior is mountainous. These mountains are very pretty; but when it comes to a bright green, sweet-smelling flower garden, such as we have at home, there is no such thing here. The 'flavoring' is left out of every thing here, and the song and the music."

LAVENDER CULTURE IN ENGLAND.

The Lavender plant although a native of the countries around and near the Mediterranean Sea will grow as far north as Norway to latitude 60°. According to Bell's Weekly Messenger a considerable acreage of land at Grove, near Canterbury, has lately been planted with Lavender and Mint, and the result has proved so successful that it has been determined to establish extensive works on the spot, in order to carry on the process of extracting the essential oils.

It has for centuries been grown at Hitchin in Hertfordshire, and as a commercial speculation it dates back for at least sixty years.

The plants at present in cultivation do not produce seed, being propagated by slips or by dividing the roots. The crop is, however, somewhat precarious. During the severe winter of 1860 many of the plants were killed, and of late years a peculiar fungus has so decimated them that the price of the oil has, in consequence, risen considerably. The oil produced in Surrey near London, is considered better even than the imported article.

A sandy loam with a calcareous substratum is regarded as the best soil for the plant, while the most favorable position for the Lavender plots is a sunny slope, which the fogs do not reach, and where light airs blow freely, but which is not so high as to be in peril of early frosts. At Mitcham, Carshalton, and Beddington, localities all near each other, about three hundred acres are still under Lavender, and a considerable area under Mint.

The Lavender flowers are collected in August and taken direct to the still, when the yield of oil to a great extent depends on circumstances beyond the control of the grower. If June and July have been bright the result is satisfactory; but if there has been dull, wet weather during these months, only half as much oil will be expressed. The oil from the stems is ranker and less valuable than that from the flowers; consequently, the portion which first distills over is collected separately, that which appears after about an hour and a half bringing a lower price. Should the flowers be distilled separately a finer oil is obtained. But as the extra labor demanded by the operation adds about 10s. per lb. to the cost of the oil, it is not usually done, since the "fractional distillation" described, effects nearly the same end. After three years the oil—which has been mellowing up to that date—deteriorates, unless it is mixed with alcohol or redistilled.

ASPARAGUS.

ASPARAGUS IN POTS.

At the recent exhibition in Turin, Italy, a number of Asparagus forced in pots attracted considerable attention. The pots were comparatively small, and many contained each some twenty sprouts; in fact, they were crowded with them. With sufficient quantities of liquid manure, it would seem not more difficult to raise Asparagus in pots than fruit trees and Grape vines.

Exhibitions & Societies.

AMERICAN INSTITUTE FARMERS' CLUB.

The meetings of this club are rapidly increasing in interest and attendance, so that every seat in the large hall is occupied at the beginning of the discussions.

At the first meeting of the year, on January 13th, Gen. K. B. Marey of the U. S. A., read a highly interesting and valuable paper on the first occupation of the western country by the expedition under his command. He gave a vivid description of the country, and the many dangers and privations encountered by the explorers and first settlers; and was listened to with marked attention.

Maj. H. E. Alvord, director of the Houghton Experiment Farm, who some twenty years later traversed the same ground in the government's service, spoke of the changes that had taken place during that period, and of the great obligation under which the country was to General Marey for the admirable management of his expedition into that wild region.

Dr. E. L. Sturtevant, director of the New York State Experiment Station, addressed the meeting about the work done by the Station in determining the relations of earliness in vegetables to the state of ripeness of the seed. Careful experiments have shown that unripe Tomato seed will grow and give a gain of fifteen days in earliness over ripe seed from the same plants. Peas and Corn fit for table use will grow and produce earlier crops than ripe seed, but plants from immature seed are more feeble than those from ripe seed. The results obtained so far show unmistakably that earliness is in proportion to the state of ripeness of the seed from which the plants have been raised. The practical question to be determined is how to combine both earliness and vigor, in the same plant, and future experiments in selecting mature seed from the earliest plants grown from unripe seed are expected to furnish the desired solution.

Among other interesting things the Doctor said that seeds raised in private gardens, as well as the Station seeds grown with all possible care were not as good as the average of seeds bought of first-class seed-houses, showing how unreasonable the indiscriminate attacks against seedsmen are. Several questions asked by members were obligingly answered, but our space does not permit to give the discussions of these and other inquiries received by mail.

The exhibition table presented a bright and attractive appearance, a large part of it being covered with a magnificent collection of Carnations from Mallock & Thorpe, also many Roses, Violets, Geraniums, Eucharis and other flowers in season. Mr. John Thorpe, president of the Society of American Florists, stated it would be impossible to describe exactly the rules and laws that guided him in his work of crossing flowers; to induce as much hardness and vigor into the seedlings was a leading object, but the main work was suggested more by intuition than anything else. This we do not doubt, but still there must be a pretty solid foundation of study and knowledge of plant physiology as a basis from which these intuitions arise in the mind.

W. C. Wilson exhibited a large and tastefully arranged basket for a table centre piece, which was highly meritorious and much admired.

At the next meeting, February 10th, Mr. Peter Henderson will read a paper on "How Portions of the Farm may be Profitably used for the Growing of Fruits and Vegetables."

The regular meetings of the Club are held every 2d and 4th Tuesday of each month at 1:30 p. m. in room 24 Cooper Union, New York. There is no charge for admission, and ladies and gentlemen interested in agriculture or horticulture are cordially invited to attend.

NEW JERSEY STATE HORTICULTURAL SOCIETY.

As usual the annual meeting of this flourishing society was well attended by the prominent fruit growers and market gardeners of the State.

Peach culture was discussed at length; stable manure was condemned by all for Peaches, potash and bone should be used instead. Severe pruning was recommended; and as the best varieties for profit all agreed on Oldmixon and Crawford's Late. The yellows were generally ascribed to poverty of the land.

Quinces cannot be grown profitably unless the best care is given; to succeed they must have plenty of manure, be mulched to keep the roots moist and cool, pruned severely by cutting back half the annual growth, keeping out the borers, and training in tree instead of bush form.

The Niagara was considered the best white Grape for market. Worden and Moore's Early are gradually taking the place of Concord, which is losing in favor.

The subject of ornamenting school grounds received considerable attention, and it was the opinion of those present that in every public school there should be at least one teacher competent to teach the elements of botany.

Many other topics were interestingly discussed, of some of which we shall make fuller mention in future numbers.

NEW YORK HORTICULTURAL SOCIETY.

Owing to the press of business in the floricultural world, incident to holiday times, no meeting was held in January. The next exhibition of the Society will take place on Tuesday, Feb. 3, at 2 p. m., in Horticultural Hall, 28 West 28th Street. Circulars and premium-lists, may be obtained from Secretary James Y. Murkland, 18 Cortlandt Street, New York.

AMERICAN HORTICULTURAL SOCIETY.

Under this name the Mississippi Valley Horticultural Society has, at its meeting just held in New Orleans, re-organized itself into a national organization, having since some time outgrown the confines of the Mississippi Valley. President, Parker Earle; Secretary, W. H. Ragan, and all the former officers were re-elected, in addition to these were elected vice-presidents for each State and Territory.

Our special report was unavoidably delayed so that we are obliged to defer it for our next issue. The horticultural exhibition, writes our correspondent, is without doubt the largest the world has ever seen.

NEW JERSEY STATE BOARD OF AGRICULTURE.

The twelfth annual meeting of the board will be held at the State House in Trenton, on Tuesday and Wednesday, February 2d and 4th. The meetings are always attended by the best and most progressive farmers of the State and are always highly interesting. Among the papers to be read and discussed are: "Insects Injurious to Vegetation," by Prof. Charles V. Riley; "Cultivation of Tobacco," by Col. James Duffy; "Agriculture," by ex-Governor A. G. Curtin; "Diseases of Animals," by Dr. D. E. Salmon; "The Farmers of New Jersey," by Amos Ebbert; "Market Gardening," by Theodore F. Baker; "Fertilizers," by Prof. George H. Cook; "Raising Poultry," by Charles Lippincott. Programmes may be obtained from the Secretary, Mr. P. T. Quinn, Newark, N. J.

NATIONAL AGRICULTURAL EXHIBITION.

The prospectus of a national agricultural, horticultural, mineral and live stock exhibition, to be held at Louisville, Ky., under the auspices of the Southern Exposition Company and the Department of Agriculture of the General Government, sets forth that while all the great expositions of the world have been designed to illustrate the progress made in manufactures, the fine arts, and the mechanical industries; the products of the soil, and agricultural machines and implements that have been displayed at these expositions, have never had sufficient prominence to give character to the exhibition. It is, therefore, proposed to hold a great exhibition in which the agricultural, horticultural, mineral and live stock interests will be the most prominent features; and which is to be essentially a Farmer's Exposition.

MASSACHUSETTS HORTICULTURAL SOCIETY.

The weekly bulletins of this model society have again made their appearance, and being always sparkling with interesting and valuable information, they are eagerly welcomed.

At the first meeting of the year, the new President, Capt. John B. Moore, whose term of office then began, delivered a most interesting address in which he gave a gratifying statement of the condition of the Society, which was never more satisfactory than at present. The financial condition of the Society must certainly be a most flourishing one, else it could not offer over five thousand dollars for prizes for the current year, viz: For flowers \$2,000, fruits \$1,500, vegetables \$800, and gardens \$200; and the appropriations for the library committee \$400, committee on publication and discussion \$200, and committee of arrangements \$300.

At the close of the business meeting, John E. Russell, secretary of the State Board of Agriculture, delivered an elegant address on Climate.

The leading subjects announced for discussion at future meetings during the season, are: Mulching, Forestry, Herbaceous Plants vs. Bedding Plants, Old and New Roses, Fruit Growing, Garden Flowers, The Leaf, Propagation of Trees, Nomenclature of Fruits, Heating Greenhouses and Comparison of Mannes.

The meetings will be held every Saturday at Horticultural Hall, Boston, at 11 a. m. All interested are freely and cordially invited to attend the regular meetings.

The Overflow.

We have such a store of good things this month that we are obliged to turn out a page full of them here as a sort of "overflow meeting."

IMPORTANCE OF THE FARM GARDEN.

Every farmer, who ever had a first-class garden, properly cared for, knows that it is a most important feature of the farm. He is aware of its usefulness; has derived pleasure and profit from it in very many ways; his wife likes it, for it gives her a feeling of independence; his whole family is healthier and happier for it, especially if the members themselves contribute something to the labor of caring for it. Its products form the most important item in provisioning the family, the most important for the health of the household, and at an inappreciably small cost. It furnishes at all times a pleasant topic for observation and conversation. What more appropriate present for a friend than a box or two of choice Strawberries? Or a dainty basket of extra early Peas or Corn? And how pleasant to sit down to dinner before a real fine collection of the very best varieties of vegetables with the satisfaction of having them all grown in one's own garden? What enjoyment in a quiet chat by a cosy fire in the winter about the year's experience in gardening and the pleasant planning in the spring with its anticipation! From first to last the garden is a constant source of inspiration and delight if condensed as it should be.

Then, the children will quicker get an insight into the wonders and "mysteries of the kingdoms of nature," from a little experience in gardening, than in ten times as much farming, and it is the way now to make the children stay on the farm by showing farming in its proper sphere as an ennobling, broadening, delightful occupation. Give them a live garden paper to encourage thought in their work and to make that work easier and progressive. Many a boy has become dissatisfied with the farm because the work was monotonous and a drudgery. The garden can easily be made a "thing of beauty and a joy," as well as the most profitable part of the farm.

Perhaps no one appreciates the advantages of a well-stocked garden, so much as the house-keeper. She knows, when an unexpected visitor comes where in a moment she can obtain a nice mess of Salads or Beets or Sweet Corn or a box of Raspberries or Strawberries for dessert. It makes her wonderfully independent and it is therefore that she appreciates its value more than the "men folks." Give the women the say, and every farm would have a good garden and the husbands themselves would be happier for it. How uncomfortable for the men to find for dinner nothing but a piece of boiled salt pork with old soggy Potatoes, and bread and butter! And how different would the same pork look were it supplemented by some crisp Lettuce, new Potatoes, a few fresh Beets, some nice Cabbage, and, for dessert a dish of Raspberries! It would often make all the difference between having good and poor help. It is stock in trade for a farmer to be called a good liver, and in no way can he so easily or cheaply raise his standard of living as by cultivating a garden.

The importance of a garden for the farmer's married helpers and especially for the laborers who have families on large farms, can hardly be overestimated. Here at a trifling expense, the employer can provide a piece of good land for the purpose, and plow and manure it. The workman will do the rest himself at odd times, some spare day, after work at night, or in the morning; and his family will help him cheerfully. It will produce the best part of the family's living the year round when carried on judiciously.

Many a farm hand have I known to sell twenty or thirty dollars' worth of vegetables and fruits, besides providing their families with all they needed. It will make him and his wife and children better contented and he will like his situation. It will keep him at home evenings and give him a stimulus for thought, when otherwise he might spend his spare time at the nearest saloon or store talking and hearing foolishness or doing worse things. And just here, let me urge that the best present to a farm hand is some good garden paper, even if he cannot read himself, he will be prompted to have it read to him, and the information thus derived will make him not only a happier and more contented man but also a more valuable one to his employers. S. B. GREEN.

RAISING ONIONS.

It is almost impossible to make the soil for onions too rich. There are few crops that will bear heavier applications of fertilizers than this. When practicable, it is best to apply only well rotted manure, working it into the surface. Yet between a choice of a liberal supply of fresh manure and no manure, I would prefer a good dressing of fresh manure direct from the barn. A heavy application of wood ashes is very beneficial if spread in the spring just before or just after planting.

When possible it is best to plow the land in the fall or some time during the winter so as to afford good drainage and promote its drying out as rapidly as possible in the spring. Of all crops earliness is most important with the onion. Therefore at the very first opportunity in the spring, just as soon as the soil is in good working condition, and the surface can be made fine and mellow I want to be ready to sow the seed. Be sure and get good seed, this is a very important part of the work. Mark the rows at least twelve inches apart and take pains to have them as straight as possible. Onions need to be cultivated when very young and as the plants at first are very small, having them in straight rows aids materially in cultivating, on this account I prefer a seed-drill. It requires less seed and sows more evenly and in a straighter line than can be done by hand. Cover very lightly not more than to cover the seed and press soil lightly upon seed.

A fine sharp-toothed rake is a good implement for early cultivation. Keep the surface as mellow as possible and allow not a single weed to grow. After the plants have made a good start thin out to two or three inches apart. The first three weeks' of growth is when they need most attention. If they are well cultivated and kept clean during this period so that they can make a rapid growth from the start, but little cultivation will be needed afterwards.

N. J. SHEPHERD.

THE ROSE GERANIUM.

I am often asked what plant I consider best for use in the house or what plant I would choose if I could have but one.

I would not like to be restricted to such a choice, but if I were, I think I should choose the Rose Geranium, for several reasons:

1st. It is a beautiful plant. It generally grows in symmetrical form. Its foliage is fine in shape and very abundant, and it is not dependent on its flowers for beauty.

2d. It is so fragrant. Every time you touch or stir it, the air is delightfully perfumed. A leaf or two in a small bouquet is sufficient to furnish fragrance which lasts long after the leaf is withered.

3d. It is so easy of cultivation. The green fly seldom gets on it, the red spider never, unless the air of the room in which you keep it is very dry. It will flourish in rooms heated with coal. The gas and dust do not injure it as they do most other plants.

4th. It is a plant which lasts for years. A flowering plant generally does not do well after it gets to be two or three years old. To have many flowers you must start new plants. You need not do this with the Rose Geranium. I have seen plants six or eight years old, quite little trees or shrubs, and nothing could be finer than such plants are for a large window. One such plant is worth a dozen small ones, even if the small ones are good ones. At any rate, it would be to me, for I like good-sized plants when well-covered with clean, handsome foliage, I become attached to a plant which has been in the house year after year. It is like a friend.

The best soil for the Rose Geranium is, in my opinion, one made up of the fibrous, rooty matter scraped from the bottom of old sods in fence corners and pastures, well-rotted manure from a barn-yard where cows are kept and loam, with a generous admixture of sand. I would combine the three first in equal parts, and to enough soil to fill an eight-inch pot, I would add a heaping handful of sharp sand, mixing the soil thoroughly. In such a compost the plant will grow robustly and rapidly, and be perfectly healthy. In heavier soils it will not. In the bottom of the pot I would put at least an inch of broken brick, to secure perfect drainage. It dislikes stagnant water at its roots.

It is desirable to keep the plant growing steadily, except at such times as you allow it to rest, which should be once a year. This can be done by giving less water, and keeping it in a cool place. When growing examine the earth in the pot frequently, and as soon as the roots have filled the soil and formed a network next to the pot, shift to a pot a size or two larger, giving fresh soil. Syringe frequently to keep off dust. No plant can be so ornamental when its leaves are covered with dust. Syringing tends to preserve health.

The Rose Geranium can be raised very easily from cuttings. Inserted in clear sand, which is kept wet and warm, not one in twenty will fail to root. If you have no use for them in the house put them in the garden to furnish fragrance and beautiful foliage for bouquets. In the fall you can give them away to friends, or lift the roots, pack them into a box and put them away in the cellar until spring, when they can be brought up and started into growth again for use in the garden.

E. E. REXFORD.

Rural Life.

SHADE-TREES ABOUT THE DWELLING.

While we do not advocate, as we notice in many places, a dense mass of foliage encumbering a dwelling, depriving it of sun and air to a great extent, says the *German Town Telegraph*, yet, when we see so many of them in town and country almost, if not entirely, deprived of shade, when it is so necessary to the comfort of the inmates, we feel a sympathy for the neglect, want of thought in behalf of the family, or perhaps in some cases the cost in labor and a little money in providing the shade, that we scarcely know how to express ourselves in sufficiently cogent a manner in regard to it. Two or three first-class shade-trees, like the Norway or Sugar Maple, whose foliage is so dense, dark, and beautiful, in front of a dwelling, give such an air of gentle coolness and comfort in the scorching days of summer, and a calm restfulness that even the most stolid beasts of the field seek and enjoy.

In our towns and cities, no matter how closely the streets may be built up, there is always room for one or more shade-trees. In setting them out, it should be done with the utmost care, and be protected against damage by strong boxes, in order that children may not climb upon them or bend them down, or horses gnaw them, or cattle rub against them. Some people fail to set out such trees, on the plea that they will not grow along pavements, owing to want of moisture. But this is a mistake. Where a tree stands in the midst of a wide asphaltum pavement, and it is impossible for moisture to reach the roots, there would be a poor chance of its living or growing; but such is not the case in either paving with flags or bricks, where a tree will grow about as well as anywhere else.

Some object to planting trees along the street in front of their houses, for the reason that people hitch their horses to them, and they are injured or destroyed by their gnawing. This serious mischief horses will do if the trees are used for hitching-posts; but it is only reasonable to suppose that every house has a separate hitch-post, either of iron,—which have become very cheap and endure forever, and which are beyond horsepower to damage with the teeth,—or of wood, capped with galvanized sheet-iron. It is well, however, to protect all trees small enough to be gnawed, which is worth being done a dozen times over, rather than be deprived of grateful shade.

But there is such a thing as having too much shade, or, rather, having too many trees, and they too near the house. In fact, a tree should stand at a distance that, while it will furnish its full measure of shade, it will at the same time permit the free ingress of the breeze. At many residences there may be noticed old, rugged, worn-out Spruce trees, that afford neither shade nor adornment, as well as many overgrown old Willow trees, all of which should be rooted out.

We repeat that we know of no trees so beautiful and umbrageous, and maintaining their symmetry, health, and usefulness equal to the Norway and Sugar Maples. The former is to be preferred for the yard or lawn, the latter for the street.

THE ENGLISH SPARROW PROBLEM.

At the recent meeting of the American Ornithologists' Union, the English sparrow was again denounced. The committee to whom this subject was intrusted collected, in a systematic way, from all the sources at their command, evidence for or against the bird.

The conclusion having been reached, comments *Forest and Stream*, that the English sparrow is in all respects a most undesirable addition to our fauna, the question arises, what is to be done to remedy the evil which the hasty and ill-considered action of a few individuals has brought upon us? This question is more easily asked than answered. We know that in Australia much ingenuity, time, and money have been unavailingly expended in efforts to rid the country of this curse. The sparrow's fecundity is something startling, and it seems impossible to hold the species in check.

One method which, so far as it goes, will prove very effectual, is to encourage those small species of predatory birds which destroy the sparrow for food. Such are the shrikes, the screech-owls, and the smaller hawks, the sparrow-hawk and sharpshin. We have no sympathy with the sentimentalists who would shed tears over the spectacle of the sparrow in the claws of a hawk, and it is certain that there is no more efficient method of getting rid of the sparrows than by permitting their natural enemies to destroy them. A shrike or a little owl will, if undisturbed, spend a whole winter in a locality where sparrows are abundant, and will during that time kill a great many.

It would be interesting to learn whether any efficient plan for destroying the sparrows has yet been devised. It is not now so much a question of getting rid of the sparrows, as of checking their increase before they spread over the whole land and kill or drive away all our native birds.

Household Pets.

REMARKABLE INTELLIGENCE AND HEROISM OF A DOG.

The large Newfoundland dog Heck, belonging to the St. Elmo Hotel, in the oil-town of Eldred, Pa., was known throughout the northern oil-field for its great strength and almost human intelligence. The porter of the hotel, a kind-hearted but intemperate person, was an especial favorite with the dog. The porter, a small man, slept in a little room back of the office. The dog slept in the office. On the night of September 18th last the porter was drunk when he went to bed, and soon fell into a heavy sleep. Sometime in the night he was awakened by the loud barking of Heck, who was jumping frantically on the porter's bed and seizing the pillow with his teeth. The still drunken and drowsy porter tried to make the dog go away, but the animal persisted in his efforts, and it finally dawned on the befuddled mind of the porter that the house was on fire.

His room was full of smoke, and he could hear the crackling of the flames. He sprang from the bed, but was still so drunk that he fell to the floor. The faithful dog at once

seized him by the coat collar, the porter not having removed his clothing on going to bed, and dragged him out of the room and half way to the outer door of the office, when the man succeeded in getting to his feet, and, unlocking the door, staggered into the street. The fire was rapidly spreading over the building, and the hotel was filled with guests, not one of whom had been aroused. The dog no sooner saw that his helpless friend was safe than he dashed back into the house and ran barking loudly upstairs.

He first stopped at the door of his master's room, where he howled and scratched at the door until the inmate was made aware of the danger and hurried out of the house, as there was no time to lose. The dog gave the alarm at every door, and in some instances conducted guests down-stairs to the outer door, each one of these, however, being a stranger in the house, which fact the dog seemed to understand in looking out for their safety. All about the house seemed to have lost their heads in the excitement, and it is said that the hotel dog alone preserved complete control of himself, and alone took active measures to save the inmates of the house.

In and out of the burning building he kept continually dashing, piloting some half-dressed man or woman down-stairs, only to at once return in search of others. Once a lady with a child in her arms tripped on the stairs while hurrying out, and fell to the bottom. The child was thrown on the floor of the hall some distance away. The woman regained her feet and staggered in a dazed way out of the door, leaving the child in the midst of the smoke that was pouring from the office door. The brave dog saw the mishap, and jumping in through the smoke, which was now becoming almost impassable, and seizing the child by its night-clothes, carried it safely out.

Notwithstanding this rescue, the mishap that made it necessary led to the death of the noble animal. The mother of the child, on being restored by the fresh air, first became aware that the child was not with her, and crying out wildly that "Anna was burning up in the house!" made a dash for the building, as if to rush through the flames to seek her child. Heck had already brought the little one out, but it had not yet been restored to its mother. The dog saw the frantic rush of the mother toward the burning building, and heard her exclamation that some one was burning up in the house, and, although the building was now a mass of smoke and flames inside and out, the dog sprang forward, and as a dozen hands seized the woman and held her back from the insane attempt to enter the house, disappeared with a bound over the burning threshold. The faithful animal never appeared again. His remains were found in the ruins.

There is no doubt in any one's mind that but for the intelligence and activity of Heck the fire in the hotel would not have been discovered in time for a single inmate to have escaped from the building with his life; and that the noble animal understood from the half-crazed movements of the child's mother that there was still another one in danger, and to rescue whom he gave his own life, is accepted as certain. The remains of Heck were given a fitting burial, and his loss is regretted as that of a useful citizen might be.—*Scientific American*.

GOOD LUCK.

Good Luck to The American Garden family of readers. Good fruit, good flowers, good vegetables, good gardens, good lawns, good health, good profits and good pleasure to all who read and act intelligently.

The Publisher's Corner.

TO STRANGERS
AND CHANCE ACQUAINTANCES
OF

THE AMERICAN GARDEN.

Several thousands of you will receive this number of THE AMERICAN GARDEN as a compliment to your interest in horticulture. Please examine it carefully. * * * (Pause for examination.) * * * Now how do you like it? Is it worth \$1.00 a year to you? Isn't there \$1.00 worth in this one number? "Yes?"

Then of course you want to subscribe for a year. And you will find enclosed a subscription blank, which will save time and bother. You have only to enclose a dollar bill (It is quite safe in the mails now), select a present of seeds or plants (worth 25 cents to \$5.00) from List 2 on page 37, write your name and send us the order. The seeds will be sent at once, the plants in spring unless wanted now, and THE AMERICAN GARDEN every month in the year.

And you will get many times your money's worth, and be helping to promote the cause of good fruits, nice vegetables, beautiful flowers and rural improvement, by supporting the only independent, popular, special journal of horticulture in America.

WHY DO WE DO IT?

Why do we make such offers for new subscriptions as appear on this page? Because we want to put THE AMERICAN GARDEN into the hands of every gardener, fruit-grower, and amateur cultivator of flowers, fruits or vegetables in North America. Once acquainted with its merits, a large proportion of them will become permanent subscribers. And because the liberal seedsmen, nurserymen and florists have agreed to furnish us with these seeds and plants (of first quality only) at about cost price, in order to encourage the publication of a first-class independent horticultural journal, such as THE AMERICAN GARDEN.

Now if you, kind readers, as friends of this cause, will show your interest by speaking a good word for THE AMERICAN GARDEN and telling of our offers of choice seeds and plants, its success will be assured.

"HOW THE FARM PAYS."

In our general 30-days reduction for clubs we offer to send this new book to any one sending us only 3 subscriptions at \$1.00 each. The retail price of book is \$2.50. See review in December number.

CHOICE SEEDS
AND
FRUIT AND FLOWERING PLANTS
FOR ONLY
THE AMERICAN GARDEN SUBSCRIBERS.
For Good Words Spoken in a Good Cause.
Dear Readers.—We know that you speak many good words for THE AMERICAN GARDEN, and we propose to meet you more than half way. Now if you will just secure the subscriptions of one, two, or more, of your neighbors or friends we will send to you in return for your kindness:

Offer open for 30 days.

LIST 1.

For one new subscriber at \$1.00 each, your choice of \$1.00 worth of seeds, or of fruit, ornamental and flowering plants or trees from the catalogue of any seedsman, nurseryman or florist who advertise in the AMERICAN GARDEN; except "special offers" of the dealers. Two subscriptions will give you \$2.00 worth; five subscriptions \$5.00 worth, and so on.

OR

For one new subscriber at \$1.00, six strong plants of the famous Marlboro Raspberry (retail price 35 cts. each.) Or a strong plant of the famous Niagara White Grape Or any four of the items mentioned under List 2.

For two new subscribers at \$1.00 each. Two strong plants of the Niagara White Grape (retail at \$2.00 each.) Or any ten of the items mentioned under List 2.

OR

You can take your choice of any of the presents offered in List 3.

This offer is ONLY FOR OUR SUBSCRIBERS, but,

Any person not a subscriber who wishes to take advantage of the above liberal offers has only to add his or her own name to the number required, and select a present for himself from List 2.

Every new subscriber at \$1.00 has the privilege of our seed and plant offers in List 2.

This offer is necessarily limited to 30 days from date of receiving this number of the magazine by our subscribers.

How to do it. Send to your seedsman for his catalogue. Select the seeds wanted. Get subscriptions enough among your neighbors to equal the amount of seeds wanted. Then send us the list of seeds and the subscriptions. We will order the seeds from the seedsman sent direct to you, and pay for them ourselves, and enter the subscriptions on our books.

CHINESE YAM.

Many people would like to try this very old but little known, though much written of vegetable. Dr. Hexamer, the editor, grew a few of them last year which he wishes to distribute among THE AMERICAN GARDEN family. We therefore offer to any one who will send us a subscription (at \$1.00) other than his own, 50 good bulbets of the Chinese Yam, sent postpaid; or 200 for 3 subscriptions. (Cost at retail \$1.50 per 100.)

We quote from a recent description: "A well-grown root will measure 2 feet in length and 2½ inches in its broadest diameter, and its quite hardy, remaining in the ground over Winter without protection. The flesh is remarkably white, and very unmeluginous in its crude state. They may be boiled or roasted, and when cooked possesses a rice-like taste; are quite farinaceous, nutritive and valuable for food. It is also a desirable climbing plant. A few tubers planted near a door or window, and the vines trained over and about it, make an ornament worthy the admiration of all. The flowers are numerous, and have a cinnamon fragrance; but the vines do not blossom until the roots are two years old. There is scarcely any difference, perceptible to the taste, between a Chinese Yam, when properly cooked, and the potato, though the yam is much whiter and finer grained."

FRUIT FACTS AT FINE FIGURES.

Mr. Chas. A. Green, that pleasing writer on fruit culture, has produced a remarkably sprightly and valuable book on "How to Propagate and Grow Fruit," as will be seen by the review under "Our Book Table." Mr. Green also edits that bright and interesting quarterly, Green's Fruit Grower. The price of the book is 50cts; of the Fruit Grower 50cts. We send the book, the Fruit Grower and THE AMERICAN GARDEN, all for \$1.20.

THE NIAGARA WHITE GRAPE
AND
THE MARLBORO RASPBERRY.

We believe that no such liberal offer of the above two famous and valuable new varieties has been made as that which we make in another column. Just think of it! A \$2.00 Niagara Grape vine, No. 1 in quality, under seal of the Niagara White Grape Co., in return for only the few words required to get one new subscription from a neighbor for THE AMERICAN GARDEN!

Or six strong plants of the Marlboro Raspberry direct from the originator for only one new subscription!

Please read the offers, and then please treat yourself to these valuable plants.

ABOUT ADVERTISEMENTS.

The advertisements of a journal like THE AMERICAN GARDEN are of special value to its readers, as they serve as a directory of the reliable houses with which it pays to trade. At this season our readers are especially interested in the cards of the seedsmen, nurserymen, and implement and fertilizer dealers. This month we present a striking array of advertisements of this class. We take pleasure in calling attention to their attractiveness and high character.

If subscribers pay the cost of printing THE AMERICAN GARDEN we are satisfied. Hence advertisers are just as essential to its life as are subscribers, and they materially help to furnish funds which enable us to put the subscription price so low as it is. Therefore you will greatly help THE AMERICAN GARDEN by mentioning it when writing to advertisers, any of our advertisers.

Further, our advertisers know the high character of THE AMERICAN GARDEN family of readers, and are more certain to be prompt and liberal if they know you are a reader of this journal. Therefore, please mention THE AMERICAN GARDEN.

OUR CONTRIBUTORS.

We do not boast of correspondents by the hundred, but we do claim many of the best practical horticulturists as regular and occasional writers for THE AMERICAN GARDEN. Following is a partial list.

P. M. Angus,	P. B. Mead,
L. H. Bailey, Jr.,	Mansfield Milton,
W. C. Barry,	Chas. E. Parnell,
P. J. Berckmans,	S. Parsons,
W. M. Brown,	L. B. Pierce,

J. T. Lovett,	E. Williams.

THE American Garden

Presents to every Subscriber.

Though we do not believe in premiums given to induce people to pay a dollar for a periodical worth many times that amount, yet in the present competition among publishers we are impelled to offer these inducements in order to get people acquainted with a magazine which they are likely to stick by for many years thoroafter.

These presents are all sent by mail prepaid, except as stated.

If you, or your wife, or daughter, or son, or friend, wish to earn money easily, you and they can do it by soliciting subscriptions among your neighbors for The American Garden on the terms below offered.

LIST 2.

A PRESENT TO EVERY SUBSCRIBER TO

The American Garden

We will send free, postpaid, to every subscriber at \$1.00 his choice of one of the following lots:

SEEDS.

- No. 1. Wild Garden Seeds: half-ounce packet of 100 varieties choice flower seeds; cost \$5.00 in single packets.
No. 2. Pansy, Perfection: splendid, large, vigorous.
No. 3. Single Dahlias: seeds of 100 choice varieties.
No. 4. Hollyhock: choice double mixed.
No. 5. Balsam, White Perfection: large, pure white, Camellia formed, good for pot culture.
No. 6. Everlasting Flowers: seeds of 12 distinct sorts.
No. 7. Ornamental Grasses: seeds of 12 best varieties.
No. 8. Pea, Bliss's Ever Bearing: 1 packet; new, very prolific, excellent quality.
No. 9. Pea, Bliss's Abundance: 1 packet; new, early, dwarf, very fine.
No. 10. Chon de Bergheley: 1 packet; new vegetable here, hardy.
No. 11. Onion, Giant Zittau: 1 packet; from Europe, handsome, enormous size, pleasant flavor.
No. 12. Water Melon, American Champion: 1 packet; highly recommended.
No. 13. Potato, Dakota Red: 1 tuber: a promising new sort; late; very prolific; of high quality.
No. 13A. Marlboro Raspberry: a strong plant of this famous new sort: from the originator.
No. 13B. Parry Strawberry: 3 plants; new; very large, beautiful, high quality, perfect flower. (Price \$2.50 per dozen).

PLANTS AND BULBS.

- No. 14. Tritoma variana (Red Hot Poker Plant, or Flame Plant): one of the best hardy plants.
No. 15. Calla Ethiopica (Lily of the Nile): a strong root of this stately plant.
No. 16. Clematis crispa: beautiful, new, flowers 1 to 1 1/2 inches across, lavender blue and white, delicious perfume.
No. 17. Tigridia grandiflora alba (New white Tigridia): a splendid acquisition.
No. 18. Lily of the Valley: 6 flowering crowns of these dainty plants.
No. 19. Clematis coccinea (Scarlet Clematis): grows 3 to 10 feet in one season, coral red flowers.
No. 20. Choice of 50 cents' worth of seeds from the catalogue of any seedsman advertising in THE AMERICAN GARDEN.

EARLY ARLINGTON CELERY.

This new early celery will be described and illustrated in our next issue. It is claimed to be an improvement on the old Boston market in earliness and hardness. We are enabled by the only grower of the seed to offer a 25 cent packet to any person who will send us one 6-months subscription (at 50 cents), or three packets (value 75 cents) for only one yearly subscription at \$1.00.

PREMIUMS.

TO THOSE SENDING SUBSCRIBERS TO

THE AMERICAN GARDEN.

We offer a choice from any of the following valuable articles to all who will send the number of subscriptions named with each article. Everything described is first-class in every way, and can be fully relied upon. Great care has been exercised to offer none but the best and none but those possessing great merit.

Almost any one can in a few hours gather names enough to get some valuable needed article Without Expense.

REMEMBER, that EVERY SUBSCRIBER in the clubs will receive one of the valuable presents of seeds and plants above enumerated, if asked for when the subscriptions are sent. Address all orders to

E. H. LIBBY,

NEW YORK, or GREENFIELD, MASS.

LIST 3.

Greatly Reduced Rates for 30 Days.

If you are a subscriber, see list 1 on page 36.

- A. Niagara White Grape: We will give a strong plant of this famous new white grape, unquestionably the finest white grape for general purposes yet produced, for only 2 subscriptions at \$1.00 each. Sent by mail prepaid. For 5 subscriptions at \$1.00 each, we will send 3 strong plants. (Lowest retail price, \$2.00 each.)
B. Marlboro Raspberry: The largest early raspberry; new; superior as a market berry; now creating much interest among fruit growers. For 10 subscriptions at \$1.00 each, we will send 40 strong plants; for 30 subscriptions, 125 plants.
C. Novelty Collection No. 1. All for 10 subscriptions at \$1.00 each. (Regular price \$18.00.)
Half doz. Marlboro, the largest early raspberry.
One doz. Hansell, earliest and best of all raspberries.
Half doz. Wilson, Jr., the largest early blackberry.
Half doz. Lucretia Deuberry, large, early, lardy, prolific.
Half doz. Early Harvest earliest of all blackberries.
One doz. Centennial Black Cap, large, early, luscious.
One doz. Cornelia, the best late strawberry.
One doz. Parry, the best of all straw berries.
One two-year Niagara, best of all white grapes.
One two-year Jessica, best of all early grapes.
Sent by express, or free by mail for a club of 12 subscribers.
D. Novelty Collection No. 2. All for 7 subscriptions at \$1.00 each. (Regular price \$10.00.)
Half doz. Marlboro Raspberry.
Half doz. Wilson Jr. Blackberry.
Half doz. Parry Strawberry.
One Niagara Grape, two years.
Sent by express; or free by mail for a club of 9 subscribers.
E. Nut Tree Collection: All for 6 subscriptions at \$1.00 each. (Regular price \$5.00.)
One Japan Chestnut, 3 to 4 ft.
One Spanish Chestnut, 3 to 4 ft.
One English Filbert, 2 to 3 ft.
One Kentish Cob Filbert, 2 to 3 ft.
One English Walnut, 3 to 4 ft.
One Dwarf English Walnut, 2 1/2 ft.
One Pecan Nut, 2 to 3 ft.
One Shellbark, 3 to 4 ft.
One Soft Shell Almond, 4 to 5 ft.
One Hard Shell Almond, 4 to 5 ft.
Sent by express only. Price, \$2.50. The valuable new book by Peter Henderson & William Crozier, on the best methods of profitable gardening and farming, as proven by the experience of these successful men. Free by mail for 4 subscriptions at \$1.00 each.
G. Any Books Published in the United States, to the amount of \$5.00 will be sent, by express, for 9 subscriptions at \$1.00 each; free by mail for 11 subscriptions.
H. Little Detective Scales. (Price, \$3.00.) Strong, accurate & scales (not cheap and imperfect balances or steel-yards) to weigh anything from 1/4 ounce to 25 pounds. Just the thing for the kitchen. Sent by express for 5 subscriptions at \$1.00 each.
I. The World's Cyclopaedia and Library of Universal Knowledge. An elegantly bound volume of 800 pages, 50,000 separate and distinct references, 1,200 engravings, accurate and concise information on agriculture, architecture, astronomy, art, science, on geography and religion. Botany, Chemistry, Engineering, Geography, Geology, and History are each treated ably and explicitly. It is in fact a Complete Library of Knowledge, including a Complete Library of Speaking and Writing; Book-keeping, a Complete Guide to Business; Chronological History; Mythology; A Complete Brief Index to the Holy Bible; A Complete Statistical and Biographical Dictionary. Full and Complete Statistical History of the United States; the Interest, Banking, Usury, Insolvent, and Homestead Laws. A List of Counterfeit Notes, with Rules for Detection. A List of Counterfeits; Separate Dictionaries of Musical, Nautical, and Geographical terms. Free by mail for 2 subscriptions at \$1.00 each.

- J. The Perfect Stylographic Pen. (Price, \$1.) A perfect pen of this class within everybody's reach. Same material and same quality as the higher priced pens. Will last for years. Contains ink enough to write 15,000 words. Used with ordinary ink. Every pen warranted. Free by mail for 2 subscriptions at \$1.00 each.
K. New York Club Skates. Known as of unsurpassed quality. No straps required, perfect clamps. Boy's Skates, No. 57, (price, \$1.60), 8 to 11 inches. Free by mail for 2 subscriptions at \$1.00 each.
Girl's Skates, No. 75, (price \$1.75), 8 to 10 inches, polished steel runners, white leather mountings, patent buckles, nickel-plated mountings. Sent prepaid for 3 subscriptions at \$1.00 each.
Ladies' Skates, No. 77, (price \$3.75), 8 to 10 inches, crucible steel, very fine. Sent prepaid for 5 subscriptions at \$1.00 each. Send length and width of foot in ordering.
L. A Really First Class Watch. (Price \$10.00). The publisher of THE AMERICAN GARDEN has carried one nearly 7 years; it still keeps good time and has never failed. A handsome, reliable watch. Sent postpaid for 13 subscriptions at \$1.00 each.
M. The Farm Library. Six handy little manuals, by the best writers: No. 1, Flowers in Winter; No. 2, The Flower Garden; No. 3, The Flower Garden, (on shrubby plants); No. 4, The Vegetable Garden; No. 5, Luscious Fruits; No. 6, The A. 1. Poultry Book. All for 2 subscriptions at \$1.00 each.
N. \$1.00 Worth of Seeds for one Subscription. To any present subscriber who will send us one new subscription at \$1.00, we will give \$1.00 worth of seeds of his own choice from the catalogue of any reliable seedsman who advertises in THE AMERICAN GARDEN, post paid. For two subscriptions, \$2.00 worth and so on.
O. \$1.00 Worth of Plants for 1 Subscription. To any present subscriber who will send us one new subscription, \$1.00 worth of Plants or Trees, of his own choice from the catalogue of any reliable nurseryman or florist who advertise in this magazine. For two subscriptions \$2.00 and so on.
P. Four Single Presents for one Subscription. To any present subscriber who sends one new subscription, any four of the presents offered under List 2. For two new subscriptions, eight of the presents under List 2. Address all orders to E. H. LIBBY, New York, or Greenfield, Mass.

ARE YOU READING ANYTHING?

"THE AMERICAN GARDEN" IN CLUB WITH OTHER PUBLICATIONS.

If you want any of the following leading publications for 1885, we will send them in club with AMERICAN GARDEN for the prices named in the last column. This offer is good for both new and old subscribers. And all club subscribers are also entitled to the seed and plant premiums offered to each subscriber under List 2 on this page.

A. Publisher's price for both.

B. Our price for both, including seed premiums of The American Garden.

Table with 3 columns: Publication Name, Price A, Price B. Includes titles like American Agriculturist, Arthur's Home Magazine, Atlantic Monthly, etc.

If you want more than one of the above or any other publications in club with THE AMERICAN GARDEN, we will give prices on application. Address,

E. H. LIBBY, Greenfield, Mass. NEW YORK.

The Three Best Peas
For Successional Crop.
Warranted Original Headquarters Seed.

BLISS'S EVERLASTING PEA.
Bliss's American Wonder. The earliest, dwarfest and sweetest. Pkt. 10c., qt., 40c.; by mail 65c.
Bliss's Abundance. One of the most productive and richest marrow. Pkt., 10c., qt., 75c.; by mail \$1.00.
Bliss's Everbearing. This fine general crop pea continues longer in bearing than any other, retaining its delicious tenderness until the last picking. Per pkt., 10c.; qt., 75c.; by mail \$1.00.

Special Inducements to Readers of this Paper.

We will send by mail postage-paid, one quart each of the above three new varieties of peas upon receipt of \$2.50 in postage stamps, or money order, and in addition allow each purchaser to select Flower Seeds from our illustrated catalogue to the value of \$1.00. This substantial offer is made with the view of introducing ourselves to the readers of this valuable horticultural journal, and at the request of its new manager. As it only stands good as long as stocks are on hand, the necessity for taking early advantage of it is apparent. Our catalogue containing "only the best seeds" for farm and garden will be mailed free to all applicants.

A. D. COWAN & CO.,

P. O. Box } 114 Chambers St., N. Y.
2541.

The houses of A. D. Cowan & Co., and W. H. Carson & Co. having been recently consolidated, the managing staff consists only of practical seedsmen, and comprises the following well known names:

A. D. Cowan, formerly with B. K. Bliss & Sons, N. Y. W. H. Carson, formerly of P. Henderson & Co., and Thorburn & Carson, N. Y. Chas. G. Wceber, formerly with Jas. Fleming, N. Y. T. V. W. Bergen, seed grower, Bay Ridge, L. I.

DAKOTA RED POTATOES.

Seed stock from the originator. THE MOST PROFITABLE OF 126 VARIETIES in a comparative test. Yielded this year over 2,300 lbs. from 1 lb. Quality equal to the old Peachblow. Bushel \$5, peck \$1.50.

PRIDE OF THE NORTH CORN.

The only true dent corn that ripens in New England. This has ripened perfectly for the past three years. Very productive. Fine quality for table and stock. Millers say it is the best for grinding, better than western grown corn. Bushel \$2.50; peck 75 cts.; half peck 40 cts.; quart 20 cts., all by express. Sacks free.

LADY FINGER POTATO. Genuine stock of this old and most popular table varieties. Selected Seed, \$1.00 per peck.

EARLY ROSE POTATO. Genuine, original stock, not degenerated, heavy yielding, smooth and A. 1. Bushel \$1.50. Blbl. \$3.00.

W. M. YOUNG, Jr., HOPKINTON, MASS.

VICK'S FLORAL GUIDE

A beautiful work of 150 pages, Colored Plate, and 1600 illustrations, with descriptions of the best Flowers and Vegetables, prices of Seeds and Plants, and how to grow them. Printed in English and German. Price only 10 cents, which may be deducted from first order. It tells you what you want for the garden, and how to get it instead of running to the grocery at the last moment to buy whatever seeds are left over, meeting with disappointment after weeks of waiting.

BUY ONLY VICK'S SEEDS AT HEADQUARTERS.
Colorful Plate in every issue. Price, \$1.25 a year; 5 copies for \$5. We will send to one address Vick's Magazine and any one of the following publications at the prices named below—really two magazines at the price of one—Century, \$1.50; Harper's Monthly, \$1.00; St. Nicholas, \$3.50; Good Cheer, \$1.25; or Wide Awake, Good Cheer, and Vick's Magazine for \$3.00.

OUR ILLUSTRATED CATALOGUE
—OF—

IT EXCELLS IN EARLINESS, LARGE SIZE, AND SWEETNESS.

"I Have Found It!"
All Should Have It.
A VERY EARLY SWEET CORN, WITH A VERY LARGE EAR. Stands unrivalled for the market or home garden. Only a few days later than the very earliest, with ears fully as large as the ever-green (the standard as regards size). Very productive, and peculiarly sweet and rich. The most profitable for the market, the most delicious for the table. It will be found very superior from its delicious sweetness, its large size ears coupled with its extreme earliness, its moderate growth of stalk for so large a corn, and its productiveness. It combines in one so many good qualities, that while it is the best early corn, it is equally good for successive sowings. It grows about 6 feet high, with 2 to 3 ears to every stalk. This corn knows no North, no South, no East, no West, but it is equally good every where and for everyone—wherever corn is grown. It is sure to give satisfaction. A trial package will convince you it is all we claim for it. Try it. 15c. PER PACKAGE (containing seed enough for 50 hills). 8 PACKAGES TO ONE ADDRESS, BY MAIL, FOR \$1.00. Prices for larger quantities on application. ALL PURCHASERS WILL RECEIVE A COPY OF OUR LARGE ILLUSTRATED CATALOGUE OF SEEDS, PLANTS, AND GARDEN SUPPLIES OF ALL KINDS FREE, contains complete lists of all the best new seeds and plants, and many other valuable novelties. Sent to others on receipt of stamp. Send at once, do not wait. Address **F. R. PIERSON, FLORIST AND SEEDSMAN, TARRYTOWN, NEW YORK.**

SEED Warranted to Grow.
or order refilled gratis. I have sold vegetable and flower seed to over a million farmers and gardeners in the United States, perhaps some are your neighbors, if so ask them whether they are reliable. Mr. Thomas Henshall of Troy, Kansas, writes me: "For 26 years I have dealt with you. I have lived in Iowa, Missouri, Colorado, and Kansas, and no matter what the soil or climate, the result was always the same, to wit:—religiously honest and good." This is the kind of seed I raise and sell. The Hubbard and Marblehead Squash, Marblehead Corn, Marblehead Cabbages, Ohio Potato, Eclipse Beet, are some of the vegetables of which I was the original introducer. A fair with \$500 in premiums. See my catalogue, free to all.
JAMES J. H. GREGORY, (Seed Grower), Marblehead, Mass

CORNELIA Straw-BERRY!
KIEFFER'S HYBRID PEAR!
Also all the older Fruits, Ornamentals, &c.
H. S. ANDERSON, UNION SPRINGS, N. Y.

THE BEST CABBAGE SEEDS IN THE WORLD ARE TILLINGHAST'S PUGET SOUND BRAND.

WHY?

- 1st. Because we have for years been perfecting the best strains, and seedling from perfect heads only.
- 2d. Because they are grown in the extreme northern part of the Union, on Puget Sound, Washington Territory, where the soil and climate are more perfectly adapted to the complete development of the Cabbage than any other section of the Union. Not only do Northern Grown Cabbage Seeds do better naturally than those grown farther South, but the more perfect development of the heads there from which the seeds are grown enables us to more critically select the true types which may thus be reproduced. The seeds also are much larger and more perfectly developed and produce larger and thrifter plants which better withstand insect ravages than any other seeds in existence.
- 3d. Because they are grown directly under the careful and personal supervision of a brother of the advertiser, who has our reputation at stake, and will see that they are kept the best in the world.

PRICES, &c. We now supply Early Jersey Wakefield, Early Dutch, Dutch Beauty, Henderson's Early Summer, Folly's Long Seed Brunswick, Premium Flat Dutch, Excelsior Flat Dutch, Late Dutch, Drumhead, Marbled Mammoth and Red Dutch, all of this justly famous P. S. brand, at 5 cts. per pkt. 25 cts. per doz., \$4.00 per lb., by mail postpaid. (Eastern stock at much lower prices.)

AN AGENT WANTED.

We want one good reliable agent (only) in every town where we have none (over 100 already established), to sell our superior seeds, and plants grown from them, to his neighbors. Full instructions for successfully growing and selling plants will be furnished with such favorable rates on seeds that you can make money rapidly. If rightly situated to act, apply at once for full particulars. Depend upon it, this is a rare chance to establish yourself in a remunerative business at your own home. For reference send for list of agents established.

Address, ISAAC F. TILLINGHAST, LA PLUME, Lack'a Co. Pa.

SMALL FRUITS!

And GRAPE VINES. I offer for spring planting a full assortment of all the leading standard and new varieties. A superb stock of the celebrated MARLBORO raspberry and other choice novelties. FIRST-CLASS, PURE PLANTS AT POPULAR PRICES. Those intending to plant largely will find it to their advantage to write me before purchasing elsewhere. Illustrated descriptive catalogue free. Address

H. G. CORNEY,
Successor to E. P. ROE,
CORNWALL-ON-HUDSON, N. Y.

The Marlboro Raspberry

With all the other varieties growing here, and with a knowledge of those catalogued throughout the world, we claim that the Marlboro has not an equal in desirable quality. We have invited all interested to come and see it, and neighbors and strangers without a single exception bear us out in the above statement. Interested parties and partisan journals may continue their misrepresentations. We say, come and see its earliness, its hardiness, its great growth of bush and unequalled size and perfection of all the berries. We also want you to eat it and try its solidity. Part of the crop was sent to Montreal, 450 miles by rail, in good order. First shipment brought 60 cents per quart, wholesale in New York, and ruled higher throughout the season than any other variety. Our new seedling grape, the

ULSTER PROLIFIC,

In hardiness, mildew and rosbug proof, and unequalled quality with its great bearing habits, much exceeds the most difficult. The refinement of our seedling the

PO'KEEPSIE RED,

Its earliness, growth and productiveness is already known to the country. The high quality of our white grape

Duchess,

Is so generally acknowledged that it no longer needs a description. Vineyardists are now planting it by the thousand. Send for circulars. Our recent hardy seedling blackberry, the Minnewaska, is not yet catalogued or priced, but will be ready next fall.

A. J. CAYWOOD & SON, MARLBORO, N. Y.

FIRE! FIRE!! FIRE!!!

Strawberries grown by an entire new process, which saves at least 75 per cent of the labor and expense of cultivation annually. It destroys insects, Weeds, Grass Seeds, etc. Saves runner cutting and resetting oftener than once in eight years. I have the largest and healthiest vines in this section, and the total cost of cultivation has been less than \$4 per acre this season. I have for sale hundreds of PLANTS, my own growing; all warranted pure stock and No. 1 plants. The above system free to all purchasers of \$2 worth of plants; to others, \$1. Send for price-list of plants and other particulars.

Three Gems of the First Water.

Bessera Elegans, Milla Biflora, & Cyclobothra Flava.

These are most desirable acquisitions, and however small the garden they should have in it a place. We refer you to the illustration as an idea of their beauty. The *Bessera* is scarlet. The *Milla* is pure white and the *Cyclobothra* is golden yellow. They are certain to flower, requiring only to be taken up in the fall. **1 of each, 50 cts.; 3 of each, \$1.00; 6 of each, \$1.50.** The 2 superb *Cannas* *Ehemanni*, with brilliant crimson flowers, immense size; *Gladioliflora*, rich golden amber, **50 cents each.** The 3 fine *Clematis*: *Jackmanni*, deep purple, *Coccinea*, brilliant scarlet, and *Crispa*, deep lavender, **for \$1.00.** The "Queen's Collection" of Flower Seeds, splendid varieties, 30 packets \$1.00. The "El Dorado," African Marigolds, golden and lemon, four inches across, 25 cts. per pkt. **V. H. HALLOCK, SON & THORPE, Queens, New York.**

GUIDE TO FRUIT CULTURE
For 1885 is a richly illustrated and elegantly printed book of over 70 pages, with illuminated cover. It tells how to grow all kinds of fruits; gives honest descriptions and fair prices of all worthy varieties, old and new, of Small Fruits, Fruit and Nut Trees, representing the largest and best stock in the United States. Contains full instructions for planting, pruning, and obtaining fruit; furnish them to their customers at a reduced price, claiming that they are genuine Niagaras. This Company desires, therefore, to inform the public, that it now has, and always has had, the absolute control and possession of all the vines grown from the wood or cuttings of the Niagara up to this time. **AND THAT NO OTHER PERSON HAS EVER HAD THE RIGHT TO PROPAGATE IT.** This ability to supply the vines of the NIAGARA, and that every vine furnished by the Company, direct or through their authorized agents, will have securely attached to it a SEAL, plainly stamped with **OUR REGISTERED TRADE MARK.** Reliable dealers and nurserymen will be supplied upon liberal terms, and furnished with authority to take orders, making satisfactory arrangements with the Company. Local agents wanted in every town throughout the United States and Canada, to sell our Niagara Vines from the sample grapes. Circulars and Colored Plates are also furnished by the Company. Address **LOCKPORT, New York.**

LOVETT'S Bouquet Collection of BEAUTIFUL BERRIES
\$8.50 for \$5.00 Consisting of one doz. each. *Hansell and Cutbert*, best early and late Raspberries; *Sonhegan* and *Gregg* best early and late black Raspberries; *Early Harvest* and *Taylor*, best early and late Blackberries; *Old Iron-Clad*, the best early, and *Parry*, best of all strawberries. Two plants, *Fry's Prolific*, best of all currants, worth at low prices of **Galdo \$8.50.** Sent by mail for \$5.00, by express for \$4.50, or half the number of each variety by mail for \$3.00. **Novelty Collection**, consisting of the best new small Fruits: No. 1, value \$18.00, by mail for \$10.00; No. 2, value \$10.00, by mail for \$5.00. Full description of all mailed free. A beautiful picture in all colors, 8x12 inches, worth the cost of the entire collection, mailed free to each buyer of any of the above collections. I ship to all parts of the country, North, South, East, and West, by mail, and express with perfect safety. **Black Raspberries and Peach Trees' specialties.**

J. T. LOVETT, Little Silver, New Jersey.

WHITE NIAGARA GRAPE
THE NIAGARA WHITE GRAPE COMPANY, having decided to offer for sale to the general public, without restriction, a limited number of two-year-old vines of their CELEBRATED WHITE GRAPE NIAGARA, orders will now be received and entered in rotation for vines to be delivered in the spring of 1885, until their stock of vines is exhausted. The merited popularity of this wonderful Grape among fruit lovers throughout the country, has induced unscrupulous persons to attempt a FRAUD in offering to furnish them to their customers at a reduced price, claiming that they are genuine Niagaras. This Company desires, therefore, to inform the public, that it now has, and always has had, the absolute control and possession of all the vines grown from the wood or cuttings of the Niagara up to this time. **AND THAT NO OTHER PERSON HAS EVER HAD THE RIGHT TO PROPAGATE IT.** This ability to supply the vines of the NIAGARA, and that every vine furnished by the Company, direct or through their authorized agents, will have securely attached to it a SEAL, plainly stamped with **OUR REGISTERED TRADE MARK.** Reliable dealers and nurserymen will be supplied upon liberal terms, and furnished with authority to take orders, making satisfactory arrangements with the Company. Local agents wanted in every town throughout the United States and Canada, to sell our Niagara Vines from the sample grapes. Circulars and Colored Plates are also furnished by the Company. **GRATEFUL-COMFORTING.
EPPS'S COCOA
BREAKFAST.**

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the five properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a deliciously flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in half-pound tins by Grocers, labeled thus:
**JAMES EPPS & CO., Homoeopathic Chemists,
London, England.**

JUST PUBLISHED!

How to Propagate and Grow Fruit.

By CHARLES A. GREEN, Editor of GREEN'S FRUIT GROWER. It contains 64 solid, condensed pages, full book size, over 50 illustrations and two beautiful lithographic colored plates. Over one hundred topics are discussed by those who are fitted by experience to advise.

The writer of this book has had many years experience as a practical fruit grower, experimenting continually on the 134 acre fruit farm which is his home.

LAYERED RASPBERRY.

Previous to the publication of this book there was no work on the propagation of small and large fruits which could be purchased for less than \$3, therefore the masses have been without a guide in this important branch of fruit growing and know very little about propagating. The price of the book places it within the reach of all. Further than this, the book gives the latest and most approved methods found in no other publication.

The new book tells how to propagate Strawberries, Black Raspberries, Red Raspberries, Blackberries, Currants, Gooseberries, Grapes, propagating the Quince, Peach, Apricot, etc., Plum and Cherry, the Pear, Apple, also general rules for propagation, with illustrations showing how to bud, how to graft, how to propagate from layers, stools, inarching, with full instructions for grafting the grape. It also gives full instructions for laying out gardens and fruit farms, how to grow fruit, market and evaporate, etc. Price, post-paid, 50 cents.

AGENTS WANTED

to sell the above book. Send 10 cents for a sample copy of the book, which will be forwarded by mail, post paid by us. SAMPLE COPY of our PAPER mailed free. 50,000 Copies of this edition are published. Address

THE "PLANET JR" HOLLOW STEEL STANDARD HORSE HOE,

As lately introduced, has no equal in the world. Its excellent work in the field has distanced that of all competitors. It is, in some sections, doing in one passage, the work of four or five old-style implements, and in others surpassing the cumbersome and expensive two-horse tools. They are the newest and best, lightest and strongest known. They are 7 distinct tools, each with special merits, no two alike or the same price; all practical and labor-saving. Let no Farmer or Gardener fail to study up during the winter evenings our 1885 CATALOGUE, which gives reduced prices, careful and exact engravings of these different machines, and such descriptions as will enable the reader to judge correctly of their merits. Thirty pages and forty engravings. Free to all. Correspondence solicited.

BLACK SILKS.

JAMES McCREERY & CO.

Are now showing a very large stock of their CELEBRATED

DE NOVI BLACK SILKS.

These silks, which are manufactured solely for us, are made with the express purpose of securing strength and durability in wear. They are perfectly free from those deleterious substances which have made the use of Gros Grains so unsatisfactory latterly. They are all woven by hand, and are finished by a new and improved process which, while giving them softness and richness in appearance, renders them much less liable to get glossy in wear. Our present prices ranges from \$1.25 to \$5 per yard.

Radzimers, Faile, Francaise, Satan Duchesse, Mascott, and other new weaves at very low prices.

The Only American Magazine SPECIALLY DEVOTED TO Floriculture for Amateurs

Which is Entirely Disassociated with any Florist's, Seedsman's, or Nurseryman's Interests. FOR THIRTEEN YEARS this popular Magazine of Floriculture and Domestic Arts has maintained a prominent position among American monthlies, and never with more credit to itself than now. Giving more space to the treatment of Floriculture for Amateurs than any other publication, it accompanies its text with several illustrations in every number, showing the shape and appearance of plants and flowers described. During 1884, there were over 140 different articles on plants and flowers, accompanied by over 40 illustrations. While aiming to present information in popular language, it strives to have every statement scientifically accurate—useful for to-day's guidance; worth preserving for reference at any future time. IF YOU LOVE FLOWERS and love to cultivate them in the window-garden, in the conservatory, or in the out-door garden, the FLORAL CABINET will bring, every month in the year, facts which will interest and aid you to attain more satisfactory results.

In its Literary Departments, the intention is to give only such matter as will educate, improve, and cheer. In its Illustrated Articles in the Departments of Domestic Arts, Mothers, Wives, Sisters and Daughters will find, every month, valuable directions for executing new and practical designs for decorative work. Domestic Economies have regular attention under various headings, and it is confidently asserted that every number contains enough useful knowledge for house-keepers to repay a full year's subscription.

The publishers send, without extra cost for postage or packing, a most attractive Seed or Bulb premium to every yearly subscriber for 1885, who requests it when subscribing. The subscription price is \$1.25 per year, which includes any one of the premiums. Single numbers 12 cents. A sample number with full details of premiums, 6 cents, if this publication is mentioned. Great opportunity to make money among your own neighbors, in cash commissions, which the publishers pay. Ask for terms to club raisers when you send for sample number. Address,
THE LADIES' FLORAL CABINET, 22 Vesey Street, NEW YORK.

Special offer for February and March: The American Garden and The Ladies' Floral Cabinet in club for only \$1.50 including premiums of both magazines.

Report on the Mapes Potato Manure.

528 Bushels of Potatoes on One Acre, One-Half Acre Yields 280 Bushels.

A. One half Acre—"Mammoth Pearl," northern seed, yield 16,829 lbs. equal to 280 bushels.

Piece "A" Ground accurately measured, one-half acre (less 180 square feet.) Soil clay moderately heavy, but better adapted for potatoes than some clay soils containing iron and inclined to bake. The preparation of this acre was thorough and the land at planting very friable and nice. It had received no manure but the Mapes prior to 1881, and had been for many years in grass, neglected until there was only a thin soil full of weeds when it was plowed up in 1881 for corn. It was just such land as I term ordinary common farming upland. Potatoes planted in rows 18 inches apart, 12 to 15 inches apart in the row, covered and levelled flat. Smoothing harrow used until the vines were 2 or 3 inches high, kept clean from weeds up to that time, then a single tooth cultivator was run between the rows full depth, (say 5 inches) and the Mapes Potato Manure, 500 lbs. per acre, distributed in the cut or furrow for the purpose of inducing root growth from rows, then a mulch of wheat chaff was spread evenly two inches in depth over the entire surface of the half acre, excepting on one half the length of four rows, this strip was left without any mulch to test the effects of the mulching; no cultivation was given after the mulch was spread.

Fertilizer used, 800 to 900 lbs. of the Mapes Potato Manure spread evenly over the entire surface, after a broadcast dressing of 20 loads of stable manure. The yield was 16,829 lbs. equal to 280 bushels (60 lbs. each) on this piece, one half acre. These measurements were accurately made by disinterested parties. This very large yield is explained by the fact

B. One half acre—"Mammoth pearl," Home raised, seed yield 248 bushels.

That the rows were twice as numerous as usual (18 inches apart instead of 3 feet) and the potatoes (contrary to expectations of some neighbors) instead of being small were very large, unusually so and very superior in quality, rarely excelled. The test made on the half of the 4 rows (40 feet long) by omission of the mulching showed no difference in either quality or quantity of yield. There was no perceptible difference at harvest. If the season had been a dry one the mulching might have proved beneficial.

Piece "B." The conditions of this piece of one half acre, were apparently just the same as with the half "A," including character of soil, fertilizers used, method of planting, excepting that home raised seed was planted and no mulch used. Yield was much inferior in quality and size of the potatoes as compared with plot "A." The product was not accurately weighed, but it fell short of the yield of plot A, by twelve to fifteen per cent. but was certainly not less than 248 bushels on the half acre. The potato bugs did considerable damage to this piece and reduced the yield, possibly enough to make up the difference. All of this potato ground had been fertilized for three years before, exclusively with the Mapes Manures. In 1881, 1,000 lbs. for corn. 1882, 800 lbs. of the Mapes Potato Manure for potatoes, in 1883, with 500 lbs. of the Mapes Complete Manures for "Light" and "Heavy" soils, 1/2 each, for Wheat.

JAPANESE PERSIMMONS.

To judge from the satisfactory results already obtained from these fruits in our Southern States and as far north as New Jersey even, the time cannot be far distant when they will become an important product of a large portion of our country. In Japan the Persimmon, or Kaki, is the most valuable native fruit, and has been abundantly grown from the earliest period, in all parts

ripe. The former are eatable in the raw state when ripe and are esteemed as among the most delicious fruits; the latter are made into delicate sweet meats, and dried in various ways.

Anaboshi is made by picking the immature, astringent fruit, and after peeling with a knife, drying on strings.

Kawogaki is made by filling a wooden case with well dried fruit made in the above

The soil most adapted to the growth of the Kaki is a gravelly, clay-loam, in a situation neither too dry nor too wet, and a free open space is necessary. Once a year, in the middle of winter, the plants require manuring, night soil being preferred, which is applied in a furrow dug around each tree. They must be pruned every alternate year in early spring or after harvest in autumn. Pruning consists simply in breaking the

覽式實材産國內

A COLLECTION OF THE JAPANESE PERSIMMONS.
(*Diospyros Kaki*)

of the country except the most southern and most northern provinces.

Through the courtesy of Henry A. Dreer of Philadelphia, we are enabled to lay before our readers the accompanying illustration of forty-two varieties of Japanese Persimmons—reduced to one-sixth of the natural size—published and sent here by the Agricultural Bureau of Japan. The execution of the original plate is remarkably accurate and artistic, and highly creditable to the Japanese artists. From the descriptive notes and cultural directions received at the same time, we quote:

"All these fruits are remarkable for being very harsh and astringent before maturity, but some of them become luscious and highly nutritious when ripe, more especially after exposure to frost; others are difficult to free from the original harshness, and never become luscious, even when quite

manner, and covering tightly with a lid which produces the appearance of a white saccharine substance on the skin of the fruit.

Tarunuki is made by packing the half ripened astringent fruits in a new Sake cask, and then covering tightly with a lid.

Sawashigaki is made by packing the fruits in a tub, pouring on them hot water boiled with straw ashes, and covering them tightly.

Jiukushi is made by wrapping the fruit in straw for a few days.

A valuable liquid is also expressed from the unripe fruit, which is widely used instead of varnish under the name of *Kakishibu* or Persimmon sap. The tree is also prized for the excessive hardness of its wood which when old becomes black as ebony.

In Japan the Kaki has long been subject to improvement by culture and selection of the best varieties which are then propagated by grafting.

branches with the hand, because this tree should not be touched with iron. The Kaki is propagated by grafting only, as seedlings are very slow in bearing, and are inferior. Following are the varieties illustrated:

- 1, Tsuru-no-ko; 2, Tankiu-dzuru; 3, Yamadzuru; 4, Ko-tsuru; 5, Shimo-maru; 6, Kumosu-maru; 7, Tane-nashi; 8, Tengu; 9, Shibu-tsuno-magari; 10, Tsuno-magari; 11, Masugata; 12, Hachiya; 13, Shimoshiradzu; 14, Okame; 15, Yemon; 16, Nitari; 17, Hiyakume; 18, Daidai-maru; 19, Goshio-gaki; 20, Goshio-hira; 21, Goshio-maru; 22, Nitari; 23, Yedoichi; 24, Zenji-maru; 25, Denji-maru; 26, Denju-maru; 27, Kabuto-gaki; 28, Kou-shiu-maru; 29, Toyama; 30, Giboshiu; 31, Miyotan; 32, Higaki Musashi; 33, Higaki Koutsuke; 34, Abura-Tsubo; 35, Hokogaki; 36, Koshibu; 37, Aoso; 38, Gionbou; 39, Saijio-gaki; 40, Kintoki-maru; 41, Hetaguro; 42, Shiinano-gaki.

The Vegetable Garden.

SEASONABLE HINTS.

A good vegetable garden should consist of two distinct parts. The one to be principally devoted to seed beds and the raising of the earliest vegetables, and those requiring most care and attention. This garden-patch proper should be in the best possible condition in every respect, and being worked by manual labor exclusively, need not be very large; it should be in a sheltered position, naturally or artificially well-drained, and receive about as much stable manure to the square rod as the average farmer spreads over an acre.

The other division of the garden is simply a miniature farm or field in which the different crops are planted side by side. All the taller growing vegetables may be easier raised in long, parallel rows sufficiently apart to admit the use of horse cultivators or wheel hoes.

Selection of Varieties. It would be impossible to devise a list of varieties that would be best adapted for all soils and situations. The following varieties, however, we know from extensive practical experience with them, to be reliable and to give satisfaction under ordinarily favorable conditions.

Beans. Early Valentine for earliest; Refugee for late, this is the best for pickling; Large White Kidney for shelling, but it is also good for fresh use; Crystal White Wax for those who do not object to its color. For poles the Large White Lima is best. Extra Early Lima is about a week earlier.

Beets. Egyptian answers all purposes.

Cabbage. Early Wakefield for early, Late Flat Dutch for winter use, and, if you want the best at any time, Improved American Savoy.

Carrots. Early Horn for early, Long Orange for winter use.

Cauliflower. Extra Early Erfurt, Early Snowball for early, Algiers or Nonpariel for late.

Celery. Golden Heart Dwarf, Boston Market.

Corn. Early Marblehead for earliest; Triumph for medium; Stowell's Evergreen is first for late use.

Cucumbers. Improved White Spine for fresh use, Green Prolific for pickling.

Lettuce. Early Curled Simpson, for earliest, Black Seeded Butter for forcing and spring, Salamander and Deacon are choice for summer use.

Melons. Hackensack and Cassaba are as good as any, but many others are just as good. Of Watermelons, the Peerless has succeeded best with us.

Onions. Yellow Danvers, Red Wethersfield.

Parsnips. Student is the mildest.

Peas. There is an endless number of varieties, and most of them are good, but if one manages them properly American Wonder and Champion of England cannot be excelled.

Radishes. Earliest Scarlet Erfurt, Olive Shaped.

Spinach. Round Leaved for early, Long Standing for late spring.

Squash. Perfect Gem for summer, Hubbard for winter use.

Tomatoes. Little Gem is the earliest but too small, Livingston's Perfection and May Flower have no superior.

Turnips. Purple Top Strap Leaf, Yellow Aberdeen, American Improved Ruta Baga.

RUST ON CELERY.

In a recent number of the AMERICAN GARDEN, it was quoted from a contemporary that by slipping tiles around the stalks, rust in Celery may be avoided. The process of culture described, besides being entirely too slow and troublesome for ordinary practise, can have nothing whatever to do with the preventing of Celery from rusting, as that has been proved beyond all question to be caused by the destruction of what botanists term the "spongioses," or what gardeners call in plainer and more expressive language the "working roots" of the plants. This destruction of the working roots is the result either of excessive moisture or its opposite, long continued dryness. Either cause produces rust or blight in the leaves of Celery in hot weather, and no process of culture will remedy it until the lower temperature of the fall months comes.

In Hudson County, N. J., the past season where probably five hundred acres of Celery, or fifteen million plants are grown annually, the unusual wet weather of August and the early part of September blighted or rusted almost without exception every field of Celery planted, and so it remained until the cooler and dryer weather of October enabled it, in a measure, to outgrow it.

In the season of 1880 we had a similar occurrence of rust or blight in the Celery, from the fact that during about the same period—August and September—hardly a drop of rain fell, but the recuperation from the affliction was rather quicker that season, for as a rule the destruction of the working roots of a plant by drying is less severe than when rotted off by water.

Almost every lady who grows a few Geraniums in her window has mourned at times the yellow leaves that come on the plants. These are the "tell-tales." The plants have suffered through excessive drouth or moisture destroying the working roots and they thus dumbly complain of the ill-usage.

PETER HENDERSON.

BRUSSELS SPROUTS.

During the winter months Brussels Sprouts is one of the most expensive and choicest vegetables to be found in our city markets. While it has always been much esteemed in Europe, in this country it has as yet attracted but little attention. A constantly increasing demand, however, seems to indicate that people are commencing to appreciate the excellent qualities of this desirable vegetable, which indeed should be found in every garden. When properly prepared for the table it is exceedingly delicate in flavor, and by some persons preferred to Cauliflower even.

The plant grows from two to three feet in height producing from the sides of the stalks, at the axils of the leaves, numerous little sprouts or miniature Cabbage heads from one to three inches in diameter; a large but loose head being also produced at the summit of the stalk. When the heads commence to form, the leaves should be broken down in order to give them room to expand. To obtain satisfactory result, and a profitable crop the ground should be heavily manured, and deeply worked; a rather heavy and moist loam is most suitable.

For a late crop the seed should be sown very thinly in a seed bed about the middle

of May, giving the young plants a treatment similar to Cabbage. As soon as large enough they should be planted out in rows about two feet apart each way. Keep the plants well and deeply cultivated, hoe often, and when they commence to head, hill them up with earth.

If it is desirable to obtain an early crop of Brussels Sprouts the seeds should be sown very thinly in a shallow box of light rich soil about the last of March, and the box placed in a gentle hot bed; as soon as the young plants are well up, they have to be gradually hardened off, and planted out about the tenth of May, and treated similarly to early Cabbages, remembering that it is an essential point in the cultivation of this plant to cultivate deeply and thoroughly.

Although Brussels Sprouts are grown extensively as an early crop, their principal value is as a winter vegetable for the heads are wonderfully improved by early frosts. Before severe freezing weather sets in, the plants should be dug up, brought to a cool cellar, and have their roots covered with sand or dry earth. CHAS. E. PARNELL.

POTATOES IN PITS.

It was stated in a recent number of the AMERICAN GARDEN that Potatoes and Apples retained their flavor better when buried in the ground than when kept over winter in a cellar. Although "flavor" in the Potato is not easily defined, the inference drawn is that the writer's observations agree with my own in that Potatoes retain their plumpness and cooking qualities better when stored in pits than in the cellar. That is, generally speaking, as there are cellars with such a favorable location that an even temperature is maintained with but little difficulty and just the right degree of moisture for the successful keeping of fruits and vegetables.

There is one disadvantage, however, in storing Potatoes in pits, and this, I think, often more than counterbalances the benefit, that is provided one has resource to a reasonably good cellar. Potatoes do not retain their plumpness and good cooking qualities long after being removed from the pit which of course is a disadvantage to both seller and consumer, unless the crop is to be sold for immediate consumption.

If disposed of at once the shrinkage is usually less on the pit stored Potatoes than those kept in a cellar. Just what per cent. the shrinkage will be in either case depends on the nature of the soil, time of growth and a variety of other influences that may effect the result. W. H. RAND.

THE MARKET CHAMPION TOMATO.

Earliness, firmness, good shape and large yield are the essentials in the ideal Tomato, and although we have already many excellent kinds there is still none that can be considered perfect. The Market Champion, now introduced by Johnson & Stokes of Philadelphia, and which has carried off the prize over all competitors wherever exhibited, is the latest claimant for superiority. It is of bright glossy pink color, smooth, of uniform size, flesh hard and solid, keeping a long time after ripening. It is a vigorous grower with quite distinct foliage, very productive, and claimed to be the earliest ripening large Tomato in cultivation.

NEW SQUASHES.

There is such an endless diversity of forms and shapes in Squashes, and the construction of the flowers so readily facilitates the crossing by bees and other insects that it is but natural that new varieties should appear almost every year; yet it is surprising that among so great a number of kinds there should be comparatively few really first class varieties. Messrs. W. Atlee Burpee & Co., Philadelphia, are now introducing the new varieties, shown in our illustrations, which are claimed to be equal, if not superior, to any of the older and standard kinds.

New Red China Squash.—The skin of this is of a vivid red color, faintly striped longitudinally with pale yellow. The flesh is rich orange-yellow, firm, fine-grained, sweet and excellent in quality, both for table use and for pies. It matures early, keeps well and is immensely productive.

New Brazil Sugar Squash.—This is a summer and fall variety. When full grown, the fruit weighs from two to four pounds, measuring six to eight inches in length. The skin is canary-yellow, and warty, the flesh is slightly greenish-yellow. It is said to be enormously productive and to exceed in quality any of the early varieties.

Salem Improved Valparaiso Squash.—Originated in Salem, N. J.; skin rich orange; flesh yellow and fine grained. This grows to very large size, weighing from fifty to over

RED CHINA SQUASH.

BRAZIL SUGAR SQUASH.

one hundred pounds each; season late, and the originator claims for it several times as much weight per acre as the Hubbard.

EXPERIENCES WITH TOMATOES.

It would be interesting to know what particular character of the Tomato suggested the name "Love Apple," by which it is known in at least three languages, doubtless many readers of the AMERICAN GARDEN can remember when under this name our mothers grew this fruit for ornament, and we were told never to touch it as it was poisonous. We should certainly be grateful to some unknown adventurer for dispelling this delusion by what must have seemed foolhardy experiments. Now we should find it difficult to substitute the peculiar refreshing flavor of this fruit, and a garden without Tomatoes seems to lack one of its most important features.

The culture of the Tomato is so simple as to scarcely need reiteration, the most approved writers on kitchen gardening urge more or less strongly the importance of starting the plants with artificial heat, of training them upon trellises, and of pinching back the leading shoots to promote earliness, etc. Were these admonitions given because those authors had proved by experiment that they are necessary, or were the authors guided by reason alone, into assuming that in the nature of the case

planting in the open ground, until I have had more experience with this manner of culture. In regions visited with late spring frosts, it might at times be necessary to protect the young plants from seed sown in the open ground; and yet I have never seen Tomato plants that came up from self-sown seed, injured by frost in spring. Possibly those who grow Tomatoes for canning purposes, might plant their seeds in the open ground with a saving of expense.

I have also made a comparative trial between plants trained upon a trellis, and those allowed to grow upon the ground; also between plants pinched back, and those unpinched.

The results showed no gain in earliness either from the training or pinching. I should add, however, that the Tomato is one of our most capricious plants, and the results of the test may, or may not be confirmed by another. It is too early to pronounce the question settled.

that must be the best way to raise Tomatoes?

Listen to the result of some experiments. Last spring I had it in mind to find out how much we gain by starting Tomato plants in the hot-bed. Accordingly, I planted a quantity of seed of the Livingston's Favorite variety in the latter part of March, in boxes, and placed the latter in a hot-bed where the temperature ranged from 70 to 80 degrees. The plants came up promptly, and grew rapidly, and many who saw them inquired if I should have any to spare. On the 24th of April, twenty-eight days after this planting, I planted some more seeds from the same package, in hills in the garden, just as we plant Sweet Corn, except that I covered them less deeply. These seeds vegetated after nineteen days and for a time, of course, bore little comparison to their hot-bed rivals. In due time the latter after being first carefully hardened off were transplanted to a plat near to the planted hills and I awaited the result of the competition, with interest. The hot-bed plants turned pale, and, as if weary of standing erect, bent their stems to rest their heads upon the ground. The others were of the deepest green, with chubby stems, and with leaves reaching as far as the plants were tall.

Last season, seeds saved from a very green fruit produced plants that ripened Tomatoes several days earlier than plants of the same variety grown from mature seeds. The plants from the green seeds were however perceptibly feeble in growth than those from the ripe seeds. The seeds from fruits gathered before fully grown and ripened by exposure to the sun, germinated well, and

SALEM IMPROVED VALPARAISO SQUASH.

Now for the result, the hot-bed plants ripened their first fruit August 19th, and the others ripened theirs August 21st, only two days later. From this time forward, the plants grown in the open ground showed no inferiority, either in the quantity or quality of the fruit. Here is an interesting question, the seed of the hot-bed plants was sown March 27, twenty-eight days before that sown in the open ground; and while the soil of the garden was yet frozen, the young plants in the hot-bed were enjoying the conditions of a tropical summer. Was the care-ditions of a tropical summer. Was the care-ditions of a tropical summer. Was the care-ditions of a tropical summer. Was the care-ditions of a tropical summer.

produced apparently healthy plants. Seeds gathered from the first fruits to ripen produced plants that matured their first fruits slightly earlier than those from seeds from the latest fruits.

This seems to be an invariable rule in other fruits also, that seeds from unripe fruits tend to promote earliness in the ratio of their immaturity.

A very noticeable feature in a test of many varieties of the Tomato, was that the sorts that were earliest in 1883, were not so in 1884. Indeed there seemed to be little uniformity in the order of ripening of varieties in the two tests.

"E.L.M."

EARLY ARLINGTON CELERY.

Celery is one of the few vegetables with which the South cannot help us to extend the season. While Florida and the Carolinas furnish us fresh Peas and new Potatoes long before our ice-bound soil becomes fit to receive the seed, Celery refuses to adapt itself to warmer climates, and earliness therefore can be gained only by growing early varieties.

Our illustration represents a new variety of Celery, originated with Mr. John Wyman, and now introduced by Mr. W. W. Rawson of Boston, for which is claimed not only extreme earliness, but also freedom from blight under conditions when other early varieties fail; it also blanches readily, two bankings being sufficient for the purpose. Market gardeners in the vicinity of Boston consider this variety a decided improvement, and having received so high an endorsement as the award of the first prize of both the regular and special premiums offered by the Massachusetts Horticultural Society, at its last autumn exhibition, there can be no doubt about its being a valuable variety worthy of trial by market gardeners as well as amateurs.

COMPLETE FERTILIZERS.

Among the most harmful and most deeply rooted prejudices under which farmers labor is that against commercial fertilizers, resulting largely from the fact that in former years large quantities of fraudulent articles were sold to them unawares. But thanks to the fertilizer laws, this state of affairs exists no longer, so that in purchasing commercial fertilizers one may know exactly what he gets, as much so—and more accurately even—as in buying hay or grain.

To determine which special kind of fertilizer will give the most favorable results in a given case however is not generally so easy a matter. A fertilizer—yard manure included—may under certain conditions produce satisfactory returns, and yet there may have been considerable waste in its use by having contained elements which the land did not need. Nevertheless there is danger of impoverishing the land in applying only a single plant-food element, as all the other elements required by the crop have to be taken up from the resources of the soil. This indirect action of a fertilizer performs a far more important part in fertilization than is generally supposed.

Mr. Charles V. Mapes, who has devoted a life time of careful study and extensive practical observation to the subject of plant fertilizers, in treating of this point, says in a recently published pamphlet on Potatoes: "Any soluble salt or fertilizer, like nitrate of soda, sulphate of ammonia, potash salts, kainit, acid phosphates, plain superphosphates, etc., when incorporated with the soil, acts as a solvent on all the plant-food in the soil, and indirectly supplies the crop, to the extent of the resources of the land, with all the remaining elements of plant-food which the fertilizer applied fails to contain.

It exhausts the soil of everything except of those elements which it supplies from its own resources. While the result for a season or two, from such a partial fertilizer, particularly on a strong soil, may be apparently satisfactory, yet, all the time, the soil is being exhausted. There is only a limited amount of plant-food in the soil in condition to yield to the solvent action even of such soluble salts as above-named. If the process could be kept up indefinitely it would be very different. To restore the land when it has been made "sick," or exhausted, by stimulating fertilizers is one of the hardest and most expensive processes in farming.

"A complete manure, a manure complete in a practical sense, one supplying all the leading plant-food elements in full proportions necessary to meet the requirements of the crop on average soils and in the best and varied forms—as found in stable manure—can never exhaust the soil, but on the contrary,

EARLY ARLINGTON CELERY.

with the exception of some waste of unused nitrogen, all the plant-food ingredients, notably phosphoric acid and potash, will last thirty years and more; will, in fact, last indefinitely until used up by future crops."

SPORTING BEANS.

A few years ago I undertook to raise garden vegetables for a pretty, large family and to supply a somewhat limited neighborhood market. As a matter of course, I thought I must raise some Horticultural or Speckled Cranberry Beans, but they did miserably in my muck and clay garden. They seemed to have no aspirations for a higher life, would not take to the poles, and produced but few pods. But there was among them one notable exception, which produced a strong vine that ran to the top of the pole and had plenty of pods well filled. When ripe it differed from the orthodox Speckled

Cranberry Bean in that it was flatter, longer and more angular, though the color and specks were much the same as in the original. I thought I had found a treasure and the year following planted every seed of them. Imagine my surprise when I came to harvest the crop. There were early and late Beans—some so late they did not ripen—Bush Beans and Pole Beans, long and round Beans, white and red Beans, streaked and speckled, flat, square and in short almost any variety of Beans that one might imagine except prolific Beans. It appeared as if, having once fairly broken loose from the steady unchanging ways of their ancestors, they had found so much sport in it, that they could not readily leave off changing. So they went on assuming different appearances until there were as many as are to be found in the costumes of a fancy dress ball.

To say the truth I enjoyed the sport and although it was not very profitable could not forbear planting again last spring. There was a smaller number of sports this year and the progeny seemed inclined to assume the shape and appearance of some half dozen distinct strains, but as there were no very good bearers among them I concluded to discard all except a few varieties, which I retained for future trial.

H. J. SEYMOUR.

FRESH SPROUTS.

More seeds fail to come up from being planted too deep than from all other causes combined.

Prof. G. C. Caldwell thinks there is little danger of getting poorer Potatoes in the larger crop with ashes as a fertilizer.

Growing Lima Beans on stout brush, six to eight feet in height, is preferred to poles by many who have tried both ways.

Have everything in readiness for spring work, but never attempt to work the soil before it is ready for it. That is before it is dry.

For hot-beds made after the fifteenth of March, Peter Henderson considers sashes covered with oiled muslin preferable to glass.

Vegetables as a rule will thrive best, other things being equal, on a naturally drained, deep, sandy loam with southerly exposure.

Rhubarb and Asparagus may be forced readily by digging up the roots with a good sized clump of soil, and placing them in a hot-bed.

Coal ashes are too valuable to be dumped in the road. On many soils a load of sifted coal ashes is as valuable as a load of stable manure.

At this season, vegetables in collars are more subject to decay than at any other, and should therefore be looked over frequently, removing all decaying matter.

To keep Sweet Potatoes in good condition they must be stored in a dry and well ventilated place with a temperature never lower than 40° and never higher than 60°.

The Fruit Garden.

SEASONABLE HINTS.

Alternate thawings and froozings of the ground prove more disastrous to small fruit plants, Strawberries especially, at this season than at any other. When the ground thaws very suddenly, it is not a rare occurrence that plants that have not been mulched are completely thrown out of the soil. To prevent this they should receive a thin coat of livery stable manure while the ground is still frozen. This protects the plants and provides fertility for a good crop.

Strawberries.—In this latitude, there is rarely anything gained by planting, if such is at all possible, before another month; but those contemplating to plant new beds, should decide now upon the varieties to be selected and the nurseryman of whom to order, and not wait till planting time.

Quality of Plants.—Many beginners in fruit culture, and some who might know better, too, seem to be entirely ignorant of the great difference between plants of the same variety. While they are perfectly aware of the material differences in quality and prices of the various grades of groceries, dry goods, hardware and every kind of merchandise, plants seem plants to them, and they select their supply from the source where it may be obtained the cheapest, irrespective of quality. And yet so great is the difference in intrinsic value between plants of the same variety, that while first class plants may be cheap at two dollars a hundred, others may be dear at a dollar a thousand, in fact they may be dear as a gift if the recipient were obliged to plant them.

Young and Old Plants.—Good plants are not grown as a second or auxiliary crop. In all first class nurseries, plants are considered of sufficient importance to be grown as a main and exclusive crop, no berries being allowed to form on plants used for propagation. And unless such a course is pursued it is impossible to produce plants of uniform first quality. Old plants will unavoidably become intermixed with the young, and while under favorable conditions old plants may live, no one would knowingly accept them in place of young ones any sooner than he would a stale loaf of bread for a fresh one. The accompanying illustrations, show the difference between the two kinds. The roots of the young plants are succulent, soft, and of uniform color and appearance, while with old plants, the main roots are black, wiry and dry, if not entirely dead. A large number of poor, weak plants can never compensate for even one healthy, vigorous growing plant.

Raspberries are among the earliest starting plants and should therefore be planted at the very first opportunity after the ground becomes fit to be worked. Order your plants now so as to have them on hand when wanted and if they should arrive before the soil or yourself are ready, heel them in a dry, sheltered spot, or in a cool cellar if the ground is frozen; they will only be in the better condition for this treatment.

Don't plant Raspberries deeper than they stood in the ground before, and cut off all canes to within three or four inches from the surface. The same directions apply also to Blackberries.

GRAPE TRELLISES.

The person who plants a few vines to provide Grapes for only home consumption need not trouble himself much about trellises, for he will find that convenient fencing and outbuildings will afford all the supports required; but to the vineyardist trellises are matters of considerable expense and the cheapest and best way to construct them is to him a matter of importance. Fortunately the trellis need not be tasteful, for the vines will cover it and hide all roughness

YOUNG STRAWBERRY PLANT.

and ugliness from view. Hence cheapness with durability only are to be sought.

The construction of the trellis should depend somewhat upon the character of the vine to be supported by it. If the vines are so hardy that they will not require laying down in winter, the trellis should be substantially built, the supports being well seasoned posts of durable wood set deep in the ground, for to replace the trellis will be a difficult matter and can be accomplished

OLD STRAWBERRY PLANT.

only by seriously disturbing the vines. But if the vines will need laying down each winter, the trellis need not be so substantial, stakes driven in the ground will serve for supports and the strips may be made of any cheap, convenient material.

It is certainly an unwise proceeding to make the rows of a vineyard, and therefore the trellises, run east and west. When so made the Grapes on the northern side will be slow to ripen and if the variety is late may not ripen at all. By making the trol-

lises north and south each side will have a supply of sunlight and the ripening will be more uniform and nearly perfect. Another fault is to make the trellises too close together. Unless land is very high-priced, the trellises should be ten feet apart. This will give room for the passage of a wagon between the rows, the vines will be all the more vigorous for the greater breadth of land to feed from, and air and sunlight can pass freely about the vines and fruit.

A substantial trellis is made by setting seasoned Locust or young White Oak posts ten feet apart, and reaching four feet above the ground. On the top, and one foot and two feet from the top, nail strips of board, or where timber is abundant, light poles split in halves. It does not require a skilled mechanic to construct such a trellis, the materials are cheap, and it will serve its purpose for fifteen to twenty years. In place of the posts, stout stakes driven firmly into the ground may be used where a structure of a rather temporary nature will answer. If the strips are made of boards, I would say to use Pine. This is light and strong enough to support all the weight it will be called upon to bear, is easily nailed and when close-grained and free from knots and "wind shakes," lasts as well as any hard wood.

Lately I have noticed considerable wire used in place of lumber strips and it appears to answer the purpose well. Galvanized wire alone should be used, as the dampness of the situation will soon rust out wires not protected from moisture. Painted wire has been used, but from my experience with it in fencing, I would not recommend it for trellises. When wire is used the posts may be placed at least twenty feet apart, the end posts being firmly braced, as in the construction of wire fences. The wire used is the smooth wire used for fencing. Of course barbs are worse than useless. The wire must be tightly stretched, as in the construction of fencing, else the weight of the vines will sag it down between the posts. As it reduces the number of posts, costs less than wooden strips, and lasts fully as long, I believe wire is better than wooden strips and shall use it when I next build trellises.

A leaning trellis for double rows has lately been tried and gives the highest satisfaction. Posts four feet long are leaned together at the top, the bottoms being placed on the surface of the ground three feet apart. The tops of the posts are so sawed that they are horizontal when placed in position and a board is nailed along the top to serve the double purpose of holding the posts together and supporting the vines; or else the posts are held together by strips nailed to their sides and a wire is stretched along the top. The bases are held in place by being attached to small stakes driven into the ground. These stakes need not be large, as the weight of the vines will soon hold the trellis in position. Two strips or two strands of wire pass along each side. A row of vines is planted along each side. This trellis saves the labor of setting posts, and posts only four feet long are required, and only five strips or strands where six would be used on single trellises. If the vines require winter covering they need not be taken down but corn fodder can be leaned against them, or straw or other litter be placed over them and held in position by light poles.

JOHN M. STAHL.

A PEACH-TREE ENEMY.

The Elm-bark Beetle, *Phloeotribustimularis* which formerly confined its devastations to the Elm principally, to-day attacks also fruit trees, especially Peaches and Cherries, and causes considerably more injury than is generally supposed. I noticed lately a small Peach orchard, every tree of which was infested, and the stems thickly covered with gum, while the previous year all were healthy and bore a crop of fine fruit. It has been stated that these insects attack only sickly and dying trees, but I have positive proof that this is a mistake, as they have killed three-years-old Cherries, Plums and Peaches that presented a most luxuriant growth and healthy general appearance.

The full grown insect, a minute cylindrical beetle about one-tenth of an inch long and one-thirteenth of an inch in diameter, issues from the bark the latter part of August through holes so small as to be nearly imperceptible, over which the cuticle closes after the insect's exit. The beetles continue to appear on the surface until freezing weather. In about four days after their appearance, they bore a hole back through the bark, the full size of the perfect insect. All the material they thus remove passes through them, their castings being merely the borings, yet it is not for the purpose of obtaining food that they gnaw these apertures, but to provide a place in which to deposit their eggs, and also to furnish a receptacle for their dead bodies.

After the female insect has deposited her eggs in the bottom of this hole, into which she fits so snugly that it is difficult to extract their bodies, she dies, forming a perfect shield for the eggs. As no traces whatever of the dead insects are discoverable the following season, I am led to the conclusion that their bodies serve as the first food for the young larvæ.

On the approach of warm weather the following spring, the eggs hatch; the larvæ begin to feed on the albumen, and radiate in jagged lines in all directions from their breeding place for about an inch in circumference. They are so numerous under the bark that they undermine it completely. But the insects and the holes in the bark are so small as to escape attention until the mischief is done and the tree dies, yet the jets of gum on the surface are plainly visible and cannot escape the attention of the observer.

As a remedy, carbolic soap and diluted potash, used alternately, have given satisfactory results. They should be applied to the trees in April, and again in August and September.

A. J. CAYWOOD.

A VINEYARD IN THE CALIFORNIA WILDERNESS

A year ago this winter I cleared and set out to vineyard sixty acres from the midst of the grand, forest-covered top of Howell Mountain, ten miles north-east of St. Helena, Cal. St. Helena is the center of the Napa Valley vineyard region—one of the principal regions of the state. The valley is narrow here and given over entirely to the Grape; in early summer, as one rides through it on the railroad, the scene is something like Paradise.

The price of land in this Paradise is \$1,000 an acre; which explains sufficiently why my sixty acres were located not in the valley but on Howell Mountain, 2,000 feet above it

where land may be had at \$30 an acre, and where it will cost about \$30 more to clear it. I began clearing in December and found it stupendous work, even with a large gang of Italians. The land lay in a beautiful, rounded slope on the south side of a vast, easy-rising hill; the forest was a forest of giants. We cut the Oaks into stove-wood—some four hundred cords; the great Yellow Pines, four and five feet through, after cutting in lengths, we tried without success to burn and ended by hauling them off below the vineyard, where they lay like the pillars of a fallen temple. Stumps were summarily dealt with by means of dynamite cartridges.

Immediately after getting the land clear I put two four-horse road-plows on it and turned the deep virgin soil—a light, reddish loam of excellent quality. Deep plowing and deep planting were requisite in view of the dry mountain summers. Thus the last of March brought us to planting.

In mountain vineyards it is deemed preferable to set out rooted vines—cuttings that have grown a year, and to make the holes, not with a crow-bar, as they do in our valley vineyards, but with a spade. I used canes eighteen inches long and planted them their full length in the ground, after having trimmed the roots back to one and two inches. This seems close pruning, but it stimulates a fresh and vigorous root growth.

The vineyard is laid out after the common Californian plan, in blocks of thirty rows one way and thirty-three another, making nearly 1000 vines in a block. The rows are seven feet apart and fourteen foot avenues are made between the blocks, by omitting one row. At each vine is driven a solid three-foot stake for training; my stakes were dipped one-half length in hot coal-tar to promote durability. The Californian vine-grower dispenses with trellises; his vines by constant pruning back are formed into a stocky stump, about two feet high, which is self-supporting.

After planting, one portion of my forces were turned to cultivating with single horse-plows, a work which requires persistent attention, owing to the rank growth of weeds and especially of Ferns. With the remaining portion I began my rabbit-proof fence built like a picket-fence with stakes set very close around the entire vineyard. This labor is unavoidable for the woods abound in jack-rabbits which have an eye single to vineyards, and will kill hundreds of young vines in a night.

Of varieties my stock comprises chiefly the Zinfandel (the standby of our wine-makers,) Riesling, Chasselas, Black Pino, Malvoisie, Mission, Savignon Vert, Muscatel and Sultana, mostly European stocks it will be seen, unknown to the eastern vineyardist. Though an ordinary summer, the growth of the vines has been excellent; and I am already seeking a cool place for a wine-cellar in view of the first vintage to come in five years.

There are as many as a dozen vineyard clearings on the mountain, which has an extensive undulating top many miles square. Our enterprise has every promise of success. We have to plant carefully; we have to light an occasional frost with smoke. But now that the valleys are crowded, vine culture will certainly extend more and more into the low mountains of the coast range, which is so very well suited for the purpose in every way.

KENOS CLARK.

HYBRID RASPBERRIES.

It seems strange that there should still be fruit-growers who doubt that the different species of Raspberries can be changed and improved by hybridization. Having been a practical experimenter for thirty years, the results of some of my experiments in this direction leave no doubt in my mind, and will furnish convincing proof to any one who will take the trouble to investigate them.

In the year 1843 I planted in my garden what we then called the wild White-cap Raspberry, that bore hard yellow fruit, of very poor flavor. In the summer of 1845 before the flowers opened I cut out the stamens of several of these flowers and removed all the other flowers from the bush. At the proper time I applied pollen of *Francenia* to the pistil of these flowers that had previously been deprived of their own pollen. Most of the plants raised from the seed of the berries thus produced strongly resembled the mother both in plant and fruit; rooting from the tips of the young canes, and never throwing up suckers. But two or three of these seedlings bore long, soft red berries, threw up abundance of suckers, and could not be induced to root from the tips. Now I ask the unbelievers in these matters, Were these two or three red seedlings hybrids, or not?

If there should still be any doubters, let me inform them of what I did with these two red varieties above alluded to, and which I have always called Hybrids. Believing that their natural characters had been in a measure broken, and that I could again cross their flowers, and by so doing I could in time combine all the good qualities of Raspberries in one or two varieties. The following summer when they came into flower I fertilized them with pollen from our best varieties, amongst others, White Marvel of Four Seasons. The results of this cross were some red, some white, and some dark orange varieties, and very much improved in fruit, but not one rooting from their tips like their grandmother. From this generation of seedlings the three most promising were saved, one light-yellow, one orange, one red.

But believing the acme of perfection had not yet reached, another attempt was made. This time the pollen of Bolle de Fontenay, Hornet, and Brinckle's Orange, were used upon the pistil of the yellow seedling. The result from the seed of these being a great many distinct varieties, four of them being very promising. One is considered an improvement on Bello de Fontenay, others resemble Hornet, but are more hardy, and another large delicious yellow is now called Diadem. This last named has the peculiarity of sometimes sending up canes that produce red fruit, and some that produce yellow fruit, from the same roots. If I were not prepared to prove this statement by some of the most intelligent and prominent horticulturists in Ontario, I would not have dared to make it. This is the only instance of this kind I have ever heard of, and in my opinion constitutes proof positive of its hybrid character, and showing at the same time a strong tendency to return to the original type.

CHARLES ARNOLD.

[The above was written for THE AMERICAN GARDEN by the late Charles Arnold of Paris, Ontario, shortly before his death, and not only shows how carefully and systematically its author conducted his experiments, but also furnishes an important contribution to pomological science.—ED.]

THE POUGHKEEPSIE RED GRAPE.

This new Grape, represented in our illustration, was originated by A. J. Caywood, Marlboro, N. Y. We have frequently noticed it at exhibitions, and with each succeeding year we became more favorably impressed of its excellent quality.

In general appearance it resembles the Delaware, being slightly darker, and berries and bushes generally a little larger. It is the sweetest native Grape we know of, free from all trace of foxiness, and even the skins may be chewed without leaving an unpleasant taste. As a table Grape it will be highly prized wherever known, and for wine making it possesses the most desirable qualifications in a very high degree.

It is said to be a cross between Iona and Delaware, wood and foliage resembling the latter; but on the originator's grounds, where we saw it growing, it made more vigorous growth, and was apparently hardier than Delaware. If this new variety succeeds over a large area as well as it does here, it will become a most valuable addition to our list of first-class hardy Grapes.

WINTER KILLING OF FRUIT TREES.

Prof. T. J. Burrill stated before the Illinois Horticultural Society his belief that the injury to trees which shows itself in patches of dead bark, partly loose sometimes, and in other cases adhering firmly to the stems, results from two causes.

When the bark dies and adheres closely, whether or not a new growth

may start underneath, the disease is blight, caused by bacteria. The damage does not occur especially in winter, but the progress of the disease is so slow and obscure that it is rarely apparent until much damage is done, the injury being shown more in the spring than at other seasons. On this account it is usually supposed to be caused by the cold of winter. This form of injury is most common on the south-west side of the trunk, and is therefore often called "sun scald," but it is not due to scald, caused by the sun's heat, as ordinarily understood. The reason that the injury is greater on this side is probably because the bark is cracked more and the bacteria can more easily enter.

These organisms can work through living cells, but cannot through the corky bark enveloping tree trunks, unless it is cracked. Insect borers, too, are more apt to infest rough bark and thus other places of access for the minute causers of the disease are opened. The sun causes this roughness and cracking by the evaporation of moisture, rendering the bark brittle and unable to resist, without rupture, the swelling caused by growth.

Although bacteria are doubtless the cause of a part of our injured orchards, the blame does not rest wholly with them. The other

If the above is correct, says Professor Burrill in conclusion, soils and locations are best which suffer least by summer drouths, and are least affected by autumnal rains. It is not the soil that holds the most water as a reservoir, but the soil that holds it longest as a sponge. These methods of cultivation and management are best which beneficially modify the effects of drouth in midsummer, and at the same time save the trees from too much water at other times. A bare soil becomes dryer in summer than when covered with mulch or green herbage. A hard compact soil gives up its moisture

sooner than one well pulverized with the plow and harrow; an undrained soil suffers more than one where stagnant water never accumulates.

SHORT CUTTINGS.

Charles Downing considered the Bartlett the best Pear for summer, Bosc for fall, and Dana's Hovey for winter use.

The Crescent is, by the Colorado Horticultural Society, considered the best early Strawberry for that State.

The free use of fertilizers is in many cases of more importance to success in fruit culture than the character of the land.

The entire Cranberry crop of last year, in all sections of the Union, is estimated at 271,500 bushels, being 121,000 bushels less than in the previous year.

Judge Wm. Parry has observed that the fruits of Bartlett Pear trees planted near Kiefers attained larger size and remained

on the trees a month longer than when planted at a distance unfavorable for this natural cross-fertilization.

A barrel of frozen Apples, says the Germantown Telegraph, can be made all right and better than before, by removing half a bushel, filling up the space thus left with snow pressed down and rounded up, and setting in a moderately warm room for a day or two.

For northern localities with short seasons, T. S. Hubbard recommends the following varieties of Grapes: Early Victor, Lady, Moore's Early, Talman, Worden, Dracont Amber; and for the South, Triumph, Herbermont, Perkins, Goethe, Norton and Niagara.

THE POUGHKEEPSIE RED GRAPE.

destructive agency is frost, causing the actual bursting of the bark or wood by the formation of ice in the tissues of the trunk, and the Professor is confident that the so-called wind-shakes of trees is really caused by freezing in a majority of cases. When the splitting occurs in layers around the interior portions it is caused by the actual formation of ice. When the crack opens radially, or from the outside directly in towards the centre, it is due to the shrinkage of the wood tissues itself and may occur without real ice formation. Such cracks sometimes open in very cold weather wide enough for a finger to be thrust in, and close again, lightly in the warm weather of spring.

The Flower Garden.

ROBIN IN THE SNOW.

Robin, singing in the snow,
Where the March winds wildly blow,
Peering through the blinding storm,
I can see thy tiny form,
On the paling's sharpened height,
Quiver with the song's delight.
Clouds above and death below,
Yet thou singest in the snow!

Not a twig on any tree
Holds a nesting-place for thee;
Not an inch of forage-ground
Bare in all the country round.
On the unswept window sill
Scattered crumbs have been thy fill.
Scanty provender, 'tis true,
For a hungry wight like you,
Minstrel, wand-ring to and fro,
For thy dinner in the snow.

Trill and twitter in the gloom,
"Sunshine bringeth leaf and bloom;
Soon on yonder snow-clad tree
Mate and nest and warmth for thee,
One whose care is over all—
I have heard His Easter call;
Trust him, though the storm may blow,"
Sings the robin in the snow.

Of the story has been told,
In the legend sweet and old,
That thy bosom's stain of red
Trickled from the thorn-crowned Head;
Watching in the twilight gray,
Ere the stone was rolled away,
Perched the sepulchre a-near,
Rose thy song of faith and cheer.
I can well believe it so,
Robin singing in the snow.

—The Continent.

SEASONABLE HINTS.

Cultivating too much land is one of the most frequent causes of failure on the farm as well as in the garden. Before deciding upon the size and extent of your flower beds it is therefore well to consider how much you feel sure to be able to take good care of. You can sow and plant an acre sometimes in less time than it requires to take good care of a few rods of ground.

A single flower bed kept in scrupulous order and neatness, a single plant even, if well grown and cared for, affords frequently more pleasure, and imparts more air of refinement to a place than a whole yard full of disorderly plants scrambling with weeds.—To avoid disappointment don't undertake too much!

Uncovering Roses and other protected plants should in this latitude be deferred till another month. When the blue birds and robins return, and a few warm days in the latter part of March make us imagine that spring had come in earnest, we know it is very tempting to relieve our garden pets of their winter clothing, but it is just then that they need it most, to protect them against the frequent changes of freezing and thawing.

Perennials, as stated in another column should be transplanted every few years. The best season for this operation is early spring, although most hardy herbaceous plants that have completed their growth by September may be transplanted with comparative safety in fall, except in the case of bulbous and tuberous rooted plants.

THE SNOWBALL MIGNONETTE.

For many centuries the Mignonette has been held as the "little darling" of flower gardens the world over, on account of its exquisite fragrance irrespective of the unattractiveness of its modest flowers. Of late, however, many varieties have been produced which vary greatly from the original type, in size of flowers and spikes as well as in colors. Yet with the increasing size of flowers there occurred generally a corresponding decrease in fragrance; to produce a large flowered fragrant Mignonette has therefore long been the aim of florists. With this view Mr. George Knoll of Pennsylvania has made extensive experiments which seem now to have been crowned with success in producing the "Snowball" Mignonette, shown in our illustration.

This seedling came from seed gathered from a mixed bed of Parson's White, White Spiral, and Ameliorata. Unlike many of the "so-called" white varieties, which are really

THE SNOWBALL MIGNONETTE.

only dull gray, this is claimed to be pure white, very full and double, and possessed of the true Mignonette fragrance. The habit of the plant is compact, pyramidal and floriferous, the spikes being carried well above the foliage. It is equally adapted for growing in pots as for out-door culture and plants exhibited at the Pennsylvania Horticultural Society elicited high praise.

PREPARATION FOR EARLY FLOWERS.

As the sun returns to the northern climes the true lover of flowers delights to make preparations for an early display of flowers, and to read the catalogues carefully so as to select the plants and seeds which will make the best display in the parterres.

If possible, a small hot-bed should be made, in which annuals, Dahlias, Gladiolus, Tuberoses, etc., etc., can be planted as soon as the snow and hoar frosts have ceased to rule. If only a three feet square of glass is attainable a goodly collection of plants can be raised which may be transplanted early in May, and by June they will fully repay all the care, labor and expense you have given them, in their beauty and fragrance. Select the sunniest spot in your garden,

and if it can have the protection of a wall or a fence against the north wind, it will be of great advantage to the growth of the plants. If you cannot obtain a wooden frame made for the purpose by a carpenter, a dry goods box may be made to do duty for it, or even a starch or soap box can be used. Horse manure is the best material to supply the requisite heat, but any kind of stable manure will do, if it is smoking and not burnt. Make a bed of it a foot in height, and tread it down firmly, or pound it tightly in place, as pressure will increase the fermenting power of the manure. Make the bed nearly a foot longer than is required for the frame work, so as to keep out the cold air. Place the box upon it, and press it down several inches into the manure, scraping it out at the sides if needful to put in the frame and then banking it up all around the box.

For sowing the seeds of tender annuals, I find that cigar boxes or any small sized boxes with a little sprinkling of well decayed manure at the bottom, and then filled up with a light sandy soil give better results than when the seeds are sown in the bed itself. Over the tiny seeds of Petunias, Pansies, Verbenas, Stocks, etc., a slight sprinkling of sand should be sifted through the fingers and pressed down upon them, as planted firmly they will sprout better. The names of the seeds may be marked on the edges of the little boxes in pencil, or else, written on slips of paper and put into small sticks which are thrust into the corners of the boxes. Four or more kinds of seeds can be planted in one box.

After they are prepared—they may be planted on the kitchen table, if you are mistress of your own kitchen—place them in the hot bed, by digging out the heating manure, and putting the boxes in compactly, with a layer of manure against all sides of each box. This will give not only bottom heat, but also side heat, but great care must be taken not to let the plants whither or burn them up by too great a degree of heat, which must be regulated by lifting the sashes a little, whenever the sun shines brightly.

When the weather is cold the frames must not be lifted at all, or very slightly if the sun falls warmly upon them. But when the air is soft, the sashes should be half taken off. Warm mats or pieces of carpeting must be placed over them every night while there is any danger of frost. If the seedlings do not have sufficient air, they will grow spindling, and will not make strong plants for bedding-out purposes.

Among the early annuals best suited for forcing are Ageratum, Asters of many colors and kinds, Balsams, *Convolvulus aureus superbus*, Gypsophilla, Salpiglossis (a beautiful flower) Scabiosa in many colors, German Dwarf Stocks, Tropaeolums in all colors, Australian Daisy—*Isotria elegans picta*, Zinnias in all shades, Verbenas, Pansies and Petunias in latest varieties.

For forcing Dahlias, Gladiolus, Tuberoses and Tigridias, place four inches or more of sandy soil over the compost, and plant the bulbs in it, and by the time the garden beds are prepared the bulbs will have made a good start and be ready to flower at least a month earlier, for your kindly attentions. Cultivate your plants with daily care, and you will raise

"Bright gems of earth in which per chance, we see,
What Eden was—what Paradise may be."
DAISY EYEBRIGHT.

THE SHOWY ORCHIS.

Orchis Spectabilis.

To most persons the name *Orchis* conveys the idea of one of those mysterious, gorgeous epiphytic children of the tropical forests; unaware that in our own woods and meadows are found many members of the Orchid family, and among them some of the most interesting and beautiful of our native plants.

In the accompanying illustration, from Henry Baldwin's *Orchids of New England*, and for which we are indebted to John Wiley & Sons, New York, is shown the only native species of the genus *Orchis* proper, popularly called Spring Orchis or, Preacher in the Pulpit. This is the first to bloom in spring, and may be found in shady woods and thickets among rocks throughout the Northern States. It is a pretty little plant with thick, oblong-obovate, shining leaves, and a low stalk of pinkish-purple and white, fragrant flowers. Botanically it is one of our most interesting native plants on account of the peculiar arrangement of its flowers.

Like most of our indigenous Orchidaceous plants it may be taken up in early spring and transplanted to a shady border or in pots; and in so doing the more of the original soil adhering to the roots is taken up in a clump, the better will be the success.

CULTURE OF HARDY HERBACEOUS PLANTS.

PREPARATION.

It is useless to hope for success with herbaceous plants without, at the outset, making reasonable preparation. Most hardy plants are deeper rooting than bedding plants, and the beds for their reception must be trenched or spaded to a depth of two feet, and well manured. Most herbaceous plants are good feeders and require good soil. Beds must not be located under trees where the roots of the latter can impoverish the soil. The idea that when once these hardy plants are planted they will go on satisfactorily for many years without any further cultivation is one of the greatest delusions possible, for unless the soil is kept in good order the whole thing is a failure, and the vigor of display and bloom ceases to be at its best.

OUT-DOOR CULTURE.

A large proportion of this class of plants is greatly benefited by being lifted every few years and divided and transplanted. Pyrethrums, Phloxes, Delphiniums, Narcissus, and others feel the good effects of division and transplanting at intervals of two or three years. Many make rapid growth and form large clumps, and these should be lifted and divided in early spring, before active growth begins, and successfully transplanted. This facility is a benefit to the grower, who can increase his stock without cost, and contrasts favorably with the

constant labor and expense required to keep up a stock of bedding plants.

An annual top dressing of well rotted manure or leaf mould is a great aid to most hardy plants, but they dislike the spade, and ought not to be dug about except when lifted or divided. It is well to let the leaves which fall upon herbaceous beds remain there during the winter, this natural covering and nutriment being beneficial.

One of the favorite arguments against the cultivation of hardy plants is that they do not give continuous bloom through the summer, and that the beds containing them are not so showy as those which afford a mass of color, like the Geranium or Petunia. This is very true where no provision is made for a succession of bloom by cultivating

be utilized for this class, and a more general use of these conveniences should be favored. In them Violets, Anemones of all the early blooming kinds, Forget-me-nots, Primroses, Hellebores, Hepaticas, Pansies, and many other beautiful things can be grown to greater perfection than in a greenhouse. It needs only to make the possibilities of frame culture known and understood to insure to the amateur who lacks a greenhouse the greatest success with the class of plants named. With frames open to the sunlight and protected by the usual method, one may have flowers in plenty from January to June. The Pansy which is everybody's favorite, is rarely seen in perfection except in a cold frame.

ARRANGEMENT.

The arrangement of hardy flowers in the garden affords so much scope for tastes and knowledge that it would require a volume to make plain the many and various phases of grouping them with an eye to effect and continuity of bloom. The landscape gardener, in laying out lawns, etc., endeavors to form groups of trees and shrubs of contrasting habits of foliage, through which pleasing vistas for the eye may reach. Only the inexperienced will attempt to dot here and there an individual tree or shrub, which by its isolation loses its effect. We must carry this idea into the flower garden, in our arrangement of hardy plants, so far as relates to the grouping of a number of one species or variety together. A hundred Daffodils growing gregariously is a much finer sight in bloom than if the same number were scattered or dotted over the surface of the bed. By carrying out this idea with all the dwarfier plants much better results are attained, and we can extend it, if space permits, in a combination of hardy flowering shrubs in forming beds of hardy flowers.

We can use for the backs of such beds as rest against a wall or fence, and for the centres of beds on the lawns, the dwarfier hardy Rhododendrons, Kalmias, Barberries, *Spiraea Thunbergii*, *Hydrangea paniculata*, and here and there some of the straggler growing Roses, such as Mme.

Plautier, Harrison's Yellow, and many of the climbing Roses like the Baltimore Belle, which is a most beautiful sight when left to scramble over a slight support. *Rosa rugosa* and the white variety are two of the finest plants for this purpose, having dark, shining, persistent foliage, not injured by insects, and very beautiful flowers. We may also include hardy Azaleas, Japan Quinces, Viburnums, Weigelas, Andromedas, etc.

In small beds a specimen of these shrubs here and there breaks the level, and relieves the eye as to general effect, besides affording flowers. In larger beds the more dwarfish kinds may be placed, two or three of each together, at intervals, but there should be no crowding.—E. L. Beard before the Massachusetts Horticultural Society.

ORCHIS SPECTABILIS.4

such varieties as come into bloom at different periods of the year. The intelligent grower, however, does not make this mistake; and here it may be said that the greatest loss under the bedding system is that of the blossoming in spring and early summer, of Tulips, Scillas, Grape Hyacinths, Narcissuses, hardy Primroses, Saxifragas, Irises, Fritillarias, Globe flowers, Crocuses and hosts of other choice plants and bulbs rarely seen under general cultivation.

FRAME CULTURE.

Our list of spring-blooming hardy plants would be greatly extended could we include the varieties which are hardy in England, but whose existence through our trying winters is uncertain. Cold frames therefore should

The Window Garden AND GREENHOUSE.

WINDOW GARDENING FOR MARCH.

We should now have an abundance of flowers, Geraniums, Lady Washington Pelargoniums, Oxalises of sorts, Fuchsias, Callas, Cinerarias, Hyacinths, Tulips, Narcissus, Heliotropes, Carnations, Petunias, Double Sweet Alyssum, Begonias, Meteor Marigolds, and many others. Keep plants in bloom as near the front of the windows as possible. Let all growing plants have plenty of water.

PRUNING.

Shorten the shoots of young Fuchsias, Lemon-scented Verbena and other plants that are likely to become too long and spindly; a short, stocky growth is more to be desired than long slender shoots. In shortening the shoots of plants do not merely pinch off the tips, as that is apt to cause the next end eye to grow out without inducing the lower ones to start; but, instead, shorten the shoots well back, and that will tend to cause all the lower eyes to grow out together.

REPOTTING PLANTS.

Plants that we have kept for winter blooming as Carnations, Chinese Primroses, Cyclamens, Callas and Libonias should not now be repotted; but young plants of Fuchsias, Lady Washington Pelargoniums, Scarlet Geraniums, Petunias and Marigolds that we desire to come into bloom between now and next June may be repotted. Young plants of Geraniums, Coleuses, Ageratums and other summer garden flowers that have been wintered in small pots, or several in a pot, may now if we have room for them, be shaken out and repotted.

In repotting summer garden plants the ball of roots should be unraveled, else in after months the matted ball will check the vigorous root action of the plants and render them an easier prey to drouth than would be the case were the roots disentangled.

Young plants raised now from cuttings or seeds should be grown along unchecked till they reach their desired proportions, hence should be re-potted as often as necessary.

Ferns should be repotted. If their present pots are large shake out the Ferns and put them into smaller pots; if too small change into one size larger only.

Over-potting is very injurious to plants. Many plants will not need repotting, but all need seeing to that the drainage is good, and there are no worms in the soil. Camellias and Azaleas do not need repotting every year, in fact, after they become large plants, once in three or more years is enough. In repotting quick-growing plants that are to remain in the pots only a few weeks as "bedding" plants in spring, or free-rooting plants in small pots at any time, draining the pots is needless; but in the case of Cyclamens, Pelargoniums, Cytisus, and other plants that we bloom in pots, draining is an advantage.

The drainage may consist of broken pieces of pots, pounded bricks or rotten stone or similar material, and over that some half rotted leaves, dry chaffy manure, or rough soil, but the common plan of a bunch of sphagnum moss is not to be commended unless the moss is chopped up fine,

SOWING SEEDS.

If you have a greenhouse you can sow at any time; if a hot-bed, after the middle of the month; if only a cold frame, then not before April; if a window only, it depends on the warmth of the room whether you sow at once or wait till the end of the month. Seeds require heat and moisture to induce them to vegetate, and light to develop healthy seedlings.

For the window use pots, pans, boxes, plates, saucers, or anything that will hold a little soil and let surplus water drain off readily. Light sandy soil as old leaf mould or fine wood soil mixed with sand is good; fill the vessel nearly to the brim, firm the soil by giving the vessel a sharp tap on the table but don't pack the soil with your hand, sow evenly over the surface and cover very thinly with fine earth. Then water gently through a fine spray rose, and place the vessels near the light but shade them from sunshine, and protect from draughts and drip.

Remove each and every bit of mould-fungus as soon as you see it, and when the seedlings come up, prick them off as soon as you can handle them, into other pots or boxes. The great thing to guard against in the hot-bed is "damp." Hot-beds must be ventilated else the germinating seedlings are apt all to mould off.

Centaureas ("Dusty Millers"), Vinesas, Verbenas, Globe Amaranths, Cockscombs, Celosias, Golden Feather Pyrethrum, Lobelias, and other plants that take considerable time before they become large enough to set out should be sown as soon as possible. Stocks, Asters, Marigolds, Zinnias, single Dahlias and other rank and quick growing plants are time enough in April. There is nothing gained by raising plants so early that we have to keep them in stunted condition till we can find room for them; from the moment a seedling is started till it attains its full proportions we should be ready to grow it along unchecked, else we had better delay its existence till we can give it the room and attention it requires.

RAISING PLANTS FROM CUTTINGS.

Soft-wooded plants like Coleuses, Finesines, Verbenas, Ageratums, Stevias, Gazanias, double white Feverfew, Nasturtiums, German Ivy and Heliotropes root easily and quickly from cuttings at this time of the year, so too do cuttings of the young growths of shrubby plants as Fuchsias, Lantanas, Lemon-scented Verbenas and Rose Hibiscuses. The wood used should be the young succulent points and so tender that when bent they will snap off. In the case of Coleuses, Alternantheras, Lobelias and many others it is only throwing time away "making" the cuttings, just stick them in as you pluck them off, they will root as well and readily as if they were "made." But Geraniums, Dahlias, Heliotropes, and many others root more evenly and usually sooner when "made."

By "making" a cutting I mean cutting it off under but close by a joint and removing the two lower leaves. Therefore I should advise amateurs to "make" their cuttings except in cases where experience has taught them that success is as certain when the cuttings are not made.

Cuttings will strike in almost anything that is damp, from pure sand to brick clay, even in water alone. But for spring work I prefer clean sand.

WM. FALCONER.

HANGING BASKETS.

There are great many positions both in greenhouse and parlor where hanging baskets make beautiful ornaments. How attractive a hanging basket looks suspended from the centre of a large window, when well filled with good healthy plants and vines drooping over the edge. Not only is it enjoyable to the occupants of the house, but from the outside it betokens love and comfort within. A few hanging baskets suspended during summer along the front of the veranda are always beautiful. In the greenhouse or conservatory there are a good many places where they do well, especially in partially shaded spots.

In positions where the sun shines very brightly there are few plants which succeed well hanging close to the glass. There are some, however, which are at home in just such a situation, requiring considerable sun to insure a good supply of flowers, such plants as *Epiphyllum truncatum*, *Cereus flagelliformis* and some of the bright flowering *Sedums*. I may add another beautiful plant for the position, *Crassula lactea*, which during the winter months produces from the point of every well matured shoot a spike of beautiful star-shaped pink flowers. The above plants do best when growing in baskets, alone without any other associates; they look better, flower more freely and show their distinctive characters only when grown alone.

In pictures we often see fine looking terra cotta baskets filled with Ferns. I am led to believe from experience with Ferns in terra cotta baskets that the only place to see them looking well is in pictures; but in rustic baskets made from wood and in wire baskets lined with moss some kinds do well, especially as individual plants, best for this purpose is *Nephrolepis exaltata* which if grown in wire baskets, sends its fronds from the bottom and sides through the meshes of the baskets and forms a large ball of beautiful and graceful appearance suitable for either window, greenhouse or veranda. *Davallia Tyermannii*, *Goniophlebium subauriculatum*, *Platyloma rotundifolia*, *Platylerium alceorne* and many others of a hardy nature succeed well in baskets if regularly supplied with water.

Hanging baskets of all kinds should be constructed to hold a large body of soil, which is a necessary requisite to maintain for any length of time food and moisture for the plants. Shallow terra cotta baskets are poorly adapted for the well-being of plants. They easily dry out and unless extra labor in watering is given, the plants will soon look sickly, there is also not enough soil in them to supply sufficient food for succulent growing plants; only the Cactuses mentioned above and some of the Oxalis do well in them. There is, however, a form of terra cotta baskets which holds a reasonable amount of soil, looks attractive, and plants do well in them for a longer period than in any of the shallow kinds. It is made in the imitation of a log of wood, and having the color of the wood burned in, keeps unfaded as long as the basket lasts.

Wire baskets are the best for plants generally. If lined with a good thickness of moss, they retain the moisture for a long time. When they get thoroughly dry the best way to wet them is to immerse in water

and allow to remain until the soil is moist clear through.

Some of the best plants for culture in baskets, especially when grown as individual plants, are *Fuchsia procumbens*, *Begonia glaucophylla scandens*, the beautiful pink blossoms of which drooping over the edge of a basket are remarkably beautiful; to fully show its beauty it should be grown as a basket plant. English Ivy trained all around a basket is excellently adapted for the parlor, enduring with impunity the dry air of the room. For mixing with other plants, *Begonias* of all kinds including the Red section, fine-leaved *Dracenas*, *Maurandias*, *Vineas*, *Ivy-leaved Geraniums*, *Thunbergias*, *Tradoseantias*, *Peperomia prostrata*, and any easily grown drooping plants are suitable.

M. MILTON.

A NEW WHITE PINK.

The almost exclusive use of white flowers for Easter decorations creates an immense demand for nearly every kind of white flowers that can be forced into bloom at this season, and offers a ready and remunerative market for really meritorious flowers of this class. The new Pink "Snow," represented in our illustration, and now being introduced by Peter Henderson & Co., New York, appears to be particularly valuable for forcing for cut flowers in winter. It is specially suited for the Easter holidays says Mr. Henderson, as it forms a perfect mass of snow white flowers, whether grown in pots or on benches. It is entirely distinct from and much superior to the old White Scotch Pink, being nearly double the size, and of the most exquisite clove fragrance. It is a true Florist's Pink, and consequently entirely hardy, thus making it a valuable plant for the flower garden as well as for forcing.

SPRING FLOWERING BULBS.

Seldom have flowering bulbs been so fine as this spring. Tulips are gorgeous in color; the texture of their petals appears like silk. Pink varieties are in brisk demand for dinner centre pieces, the "Cottage Maid" being the leading favorite. This lovely pink and white variety is frequently used for the corsage bunch, which is somewhat of an innovation, as Tulips are not considered a suitable flower for personal ornamentation. If, however, Cottage Maid Tulips have their foliage turned down, they are charming and æsthetic for the bodice bouquet.

The Holland Hyacinth crop is very handsome, and newly imported varieties are eagerly sought for all decorations, while these can be placed in moss or left in the pots. They are extremely satisfactory because they last so long and are bright and sweet-scented until entirely withered. "Porcelain Sceptre" is a variety that is very popular for the delicacy of its lavender tint.

Snow-drops have been forced for the first time in this country this spring. A florist planted a dozen bulbs in colored potteries, made for the purpose, and when the dainty white bells flowered, used them for dinner favors, placing one dish at each cover.

Lily of the Valley has been forced in high pyramid potteries with holes for the flowers to start through. These are very effective

Yellow English Primroses are just appearing in small quantities, these are all engaged before they blossom, so highly are they prized. A bouquet of Yellow Primroses with a cluster of the dark purple Czar Violets at one side brought a fabulous price for a birthday souvenir.

LILACS.

These shrubs are forced in marvellous beauty at present, the tassels seeming to have the full strong bloom of summer Lilaes. The soft French Lilacs, of the variety of Charles X, were the first sent from the greenhouse; these were nursed in shaded conservatories as tenderly as invalids, that they might be pale, or have only a faint tint of color. They sold for one dollar a tassel.

At present common Lilaes are forced, and entire bushes of these are cut for filling high vases in large decorations. They make the softest and loveliest effects, and bear the breath of the June gardens.

OUR WINDOW BOX.

The Calla is one of the few house plants that does not suffer when constantly kept in a saucer filled with water.

Start a few Gloxinias, Achimenes and tuberous-rooted Begonias now. Give them very little water till they begin to grow.

Fresh air is as necessary to house plants as to ourselves, but they do not like strong and sudden draughts any more than we do.

If you want to kill your sickly plants with kindness, give them strong liquid manures; it is as effective as feeding a dyspeptic with rich, indigestible food.

Sand used for starting cuttings

should be washed, by putting a quantity into a tub or pail, fill up with water, stir around with a stout stick and then drain off the water.

Copyright by Peter Henderson & Co., 1881.
THE NEW WHITE PINK "SNOW."

for table centres or greenhouse decoration.

The *Freesia* is becoming a favorite flower and is used particularly for *boutonnieres*, which are worn very large as in England. One dozen sprays of Roman Hyacinths are used for the coat knot, and eighteen sprays of Lily of the Valley, but large *Gardenias* are preferred above all other flowers, for the *boutonniere*.

PRIMROSES.

Seedling Primroses, always admirable, are unusually so this season. There are a number of new seedlings which have made a sensation. The Chiswick Red are the favorites. Groups of these plants are found in the best decorations, and the trusses are frequently cut to ornament the dinners and luncheons given to young people.

"THE WISE GETTING, GIVING AND SPENDING OF MONEY ARGUES THE PERFECT MAN."

Any person to whom time is worth less than money and wants to start a plantation of Marlboro Raspberries or Niagara White Grapes will do well to read our offer on page 63.

Lawn and Landscape.

HOW TO MAKE A LAWN.

The operation of making a thoroughly good lawn requires much painstaking attention in addition to a knowledge of drainage and the best methods of treating special soils. We will simply undertake to give a few general directions that will be found in most cases essential to success.

Should moist spots or special growths of coarse grass indicate that such treatment is necessary, the proposed lawn must be drained at an expense probably of \$50 to \$75 per acre. The first work to be undertaken, independent of drainage, is the removal of stumps, stones and weeds by repeated plowing and harrowing and carrying off or burning. A liberal application of fifty to seventy-five tons of well-rotted stable manure should be next applied to the land. This should be carefully and evenly distributed over the surface, and then spaded or plowed in to the depth intended for the lawn. Some of the best lawns in the world are made by spading to the depth of at least eighteen or twenty inches, but thorough and skillful plowing and sub-soiling accomplishes the necessary pulverizing and mixing and does the work quite as well as spading, provided an equal depth is reached. Deep culture in the preparation of a lawn is of the utmost importance, for our deep culture depends in a large degree the ability of the grass to resist the severe effects of protracted drought.

Having cleaned, deeply plowed and liberally fertilized the soil of the proposed lawn, the next thing is to prepare its immediate surface, or in other words to grade it. Long flowing surface lines should characterize the grade as finally established, and slight elevations or swells more or less pronounced according to the topography of the surrounding territory, should appear immediately around the trees and shrubs and the other outskirts of the tract. Mathematical lines it should be remembered are to be avoided in lawn making. The natural effect is always the best effect to be obtained in landscape gardening and flat surfaces and straight lines are never found in nature's work of this kind. A top dressing of fifteen or twenty tons of old well-rotted stable manure or a ton of ammoniated super-phosphate of lime, or of some reputable lawn fertilizer should now be spread over the graded lawn and then lightly spaded or plowed in so as not to disturb the lines of grade established. The surface should then be once more harrowed and raked carefully. All this fertilizing spading, plowing, sub-soiling, harrowing and raking repeated over and over again may seem like taking unnecessary trouble, but we assure the reader that such repetition of effort is seldom wasted in the endeavor to secure an approximation to soil in which no one inch is more dense than another.

Next in order comes the sowing of the seed. Good mixtures of different kinds of grass seed are offered by all reputable seedsmen and are said to be more effective because of the number of varieties used but we have found Kentucky Blue Grass, *Poa pratensis*, excellently adapted to most soils, a vigorous grower from the start, and fitted

to produce a rich green, lasting sod on sandy as well as heavy land. Do not spare grass seed if you wish to make a good lawn. Six bushels to the acre of Kentucky Blue Grass seed is not too much, and you may if you wish, add a few pounds of White Clover seed, although White Clover is apt to work its way into many lawns without sowing. Rake in your grass seed evenly and thoroughly and then at once roll the lawn with a heavy iron roller in order to pack the seed firmly into the ground and thus help materially the progress of germination. Roll frequently during at least the first season, and begin to cut as soon as the hand mower will take hold well. The extra care of frequent cutting and rolling is important for the thickening and even growth of the young grass.

SAMUEL PARSONS, JR.

SOME GOOD NATIVE VINES.

You will probably want something to plant about your veranda or porch, to climb over the gate, or cover an unsightly stump, or the fence that is hardly as ornamental as you would like to have it. If you do, I would advise you to take your basket as soon as the frost leaves the ground, and go to the woods to find the plants which will give you better satisfaction than any others you can get. These may also be procured of many nurserymen if you can not find them in the woods or pastures near you.

VIRGINIA CREEPER.

The *Ampelopsis quinquefolia*, or American Ivy as it is also called is the best climber for all purposes. Everybody knows it. It is to us what the Ivy is to the English, and is quite as ornamental at any season as the Ivy, and vastly more attractive and showy during the fall. It can be found growing plentifully along most swampy places, and is very easily transplanted. It is a rapid grower, often reaching out fifteen or twenty feet in a single season. It clings to smooth surfaces by means of little disks attached to a sort of tendril, these disks acting on the principle of the "suckers" boys like to fashion out of pieces of leather to lift stones with. The foliage is thick, and a wall is soon covered by it. It climbs to the eaves, and will overrun the roof if allowed to do so. Its flowers are a greenish-white, and inconspicuous, but very fragrant. These are succeeded by dark purple berries, borne on crimson stems. These are very attractive after the leaves have fallen. But the plant is most effective in autumn when the leaves turn to crimson and maroon. The plant is one mass, then, of most gorgeous color; indeed, no flowering plant is one half as showy when in full bloom. This vine is excellent for covering arbors, old stumps,—anything, in fact, that it is desirable to cover.

CLIMBING BITTERSWEET.

Celastrus scandens is the botanical name of this beautiful native climber. It is not as frequently met with as the Virginia Creeper, but it is to be found in most places at the North. It is a rapid grower, but not as un-reaching as the one already described, seldom reaching a greater height than twenty feet. Its foliage is a very bright green, always clean and healthy. I have never seen it infested with any kind of worm or insect, and on this account it is very desirable for use about the veranda or the porch. It bears

profuse crops of scarlet berries, each berry enclosed in an orange husk which parts and turns back from the fruit. These clusters are very showy in autumn and would hang on all winter if the birds would let them alone. They are very useful for ornamenting the rooms in winter, and for Christmas decorations. This vine twines about trees, posts, or anything with which it comes in contact that it can encircle with its long stems. It is an excellent vine in every way, and only needs to be more generally known to become extremely popular. It has far greater merit than any imported vine. In saying this I am not unmindful of the claims of the Wistaria and the various Honeysuckles. Good as they are, the Bittersweet is better.

VIRGIN'S BOWEN.

This is the hardy native vine which every collection should include, *Clematis Virginiana*. It is not a rampant grower, but it will fill all requirements for porches, verandas, or summer-houses, or training about windows. It has pleasing foliage, and bears a great profusion of delicate, airy white flowers of delightful fragrance. We have few more desirable plants for supplying cut-flowers for the house. The long branches covered with bloom are simply exquisite for use in vases with flowers of brighter color. They beautify any thing they come in contact with, and harmonize with everything.

E. E. REXFORD.

WHAT SHRUBBERY WANTS.

With our present methods, what is wanted to bring back the shrub to its proper position in the lawn, says Edgar Sanders, is at least when young, free, loose ground. If this interferes with the regulation lawn, fringe the borders of the shrubbery with hardy perennials of low, growing character; but by all means keep the grass roots out, and the mowing machine man away from the branches. Treated thus, all the stronger shrubs will make a vigorous growth, and when they have arrived at the smothering age, and can compete with the grass, sometimes it may pay to forsake the border and form a belt. It will be the grass that will usually suffer then. Finally, if any one wants to see what a shrub requires, let him go to a good nursery, and out word for it, if the ground is kept loose and friable, the weeds eradicated and each plant given room to spread its branches, he will find a perfectly symmetrical growth of luxurious branches; and if this treatment is continued, the shrub will go on in the same way, a thing of beauty, and a credit to any place, large or small.

HARDINESS OF MAGNOLIA GRANDIFLORA.

The *Magnolia grandiflora* is hardly not only as far north as Philadelphia, as stated in the last number of the AMERICAN GARDEN, but it will live and bloom on Long Island, so says Dr. J. W. Barstow of Flushing.

The same authority also informs us that our native Azaleas, the white and the pink may be easily transplanted from roadsides and open places, and will do well under cultivation.

Kalmias taken from the woods are almost always sure to die, but good plants from nurseries will, with proper care, grow well and form beautiful shrubs. Many of our native shrubs are very desirable for the lawn.

Foreign Gardening.

FRUITS OF THE AMAZON.

(Continued from our last number.)

CO-OA-CHIE-SE-BA.

This fruit much resembles the Cocoa Plum in general appearance but is far better, the pulp being sweet and pleasant. It is a tall tree often found overhanging the river on the middle Amazon and we have repeatedly gathered it while paddling up the river.

GENIPAPA (GENIPA.)

Of these are several species which produce brown fruit about the size of an Orange the flesh is yellowish white with small hard seeds, acid sweet but with a rank smell and not good. The juice of the unripe fruit of one species is used in tattooing by the Indians, becoming indelible if pricked into the skin.

PASSION FLOWERS.

Many of these produce edible fruits varying in size from a Walnut to that of a Melon. When ripe they are orange yellow, a spongy tissue inside usually inclosing an acid pulp full of small black seeds; but *Passiflora macrocarpa* has a flesh resembling in color and taste a rich Musk-melon. These fruits are called "Masaouja."

CACTUS.

Two species of Cactus yield an edible fruit; they are tall with angular stems, one, *Cereus Brasiliensis*, being always a very effective plant from its tall bluish green stems and numbers of large white night blooming flowers. The fruits are red, full of small seeds and of sweet pleasant taste.

TAPESIBA.

From the delta at Para far up into Peru this is a favorite fruit. The tree *Spondias lutea*, is very ornamental with light green foliage and clusters of sweet white flowers. The fruit is yellow, acid and very pleasant but if taken in quantity makes the tongue and mouth sore. It is best infused in water and with the addition of a little sugar, makes a delicious drink. All wild animals are very fond of this fruit and the vicinity of a Tapesiba in fruit is a good place for the hunter. Another species of this family *S. cytheria*, native of the Sandwich Islands, is sometimes found in gardens in Brazil. The fruit is larger, round and more acid and only used for sweetmeats.

MIRIXI.

A small tree producing a greenish fruit which resembles in shape a small flat button. In the season the ground is covered with this fruit which is sweetish and mealy and seems to be a food of the large blue butterfly *maspho* which is always there found in great numbers. Two fruits especially plenty on the river, Tapejos above Santarum are the Aápiranga and the Uniri. The former is small, red, looking like a Sand Plum with a sweet pulp, the latter has a wider distribution and is the tree which produces the rich balsam of Umiri, it is a black drupe with a rich sweet taste.

UVAS.

Above Jaffe on the Amazon and far into Peru a very delicious fruit abounds called "Uvas" or Grapes from the resemblance to that fruit. The tree has very large palmate leaves and produces the fruit in heavy roundish bunches close to the trunk. The fruit is black like an immense flat Grape

with a tough skin, and full of a sweet viscid fluid around an almond-like seed.

Our space is failing us and we have none to write of the wild Cocoa, of the "Wishi Yucu," and "Wishi ensua" both with yellowish sweet flesh, the fruits brown with smooth stone the latter black with deep furrowed stone and both of delicious smell, of the "Cuma" and "Uike" and "Pama" of the upper river, and many others, many good, some inedible except to the natives, but none take the place of the berries of the United States or are equal in flavor to a second rate Strawberry. E. S. RAND.

COUNTRY LIFE IN FRANCE.

France is literally one large garden, writes a correspondent of the New York Sun. Every inch of soil is cultivated. In riding from Paris to Dijon, 150 miles, we counted only thirty cattle. We saw no sheep or hogs. The farms are usually from one to ten acres. Some farms have half an acre, and some have as many as twenty acres. They are usually 30 to 300 feet wide, and from 1,500 to 2,000 feet long. There are no fences between them.

When I asked a French farmer how his farm happened, like all the rest, to be so long and narrow, he said:

"It has been divided up so often. When a French father dies he divides his farm, and each one of his children has an equal share. He always divides it lengthwise, so as to give each one a long strip."

"How large is your farm?" I asked.

"My father's farm was 300 feet wide and 2,000 feet long. When he died my brother had half. Now my farm is 150 feet wide and 2,000 feet long. It is quite a large farm. There are many farms much smaller than mine."

"What do you plant in it?" I asked.

"See over there," he said, pointing to what seemed to be a gigantic piece of striped carpet, "is a strip of Wheat sixty feet wide. Then comes a strip of Potatoes 25 feet wide. Then come 40 feet of Oats, then 10 feet of Carrots, 20 feet of Alfalfa (Luzerne) 10 feet of Mangel wurzels, 5 feet of Onions, 5 feet of Cabbage, and the rest in flowers, Peas, Currants, Gooseberries, and little vegetables."

"Can you support your family on a farm 150 feet wide and 2,000 feet long?" I asked.

"Support my family?" he exclaimed. "Why the farm is too large for us. I rent part of it out now."

"But your house," I said, "where is that?"

"Oh, that is in town. Five families of us live in one house there. My wife and I come out every morning to work and go in at night."

"Does your wife always work in the field?"

"Yes. My wife," he continued, pointing to a barefooted and bareheaded woman at least six feet around the waist, "she can do more work than I can. She pitches the hay to me on the stack. All French women work in the field. Why not? They have nothing to do at home."

This is true. The wife of a French farmer has nothing to do at home. They do not keep house like the wives of American farmers. The handsome farmhouse, off by itself, surrounded by trees and gardens, does not exist in France. French farmers

always congregate in little, tumble-down villages situated about two miles apart. The roofs are moss-covered, the houses are dirty, and remind one of a country poorhouse in New England.

There are millions of farms in France containing from a quarter of an acre to four acres. I find that an acre and a-half is about all the most ambitious man wants. The rent for the land is always one-half the crop. The land is worth about \$400 an acre; or, if in Grape vines, \$600.

That is why France is like a garden. In England there are 227,000 landowners; in France there are 7,000,000 landowners. The Frenchman on his two acres, with his barefooted wife cutting grain with a sickle by his side, is happy and contented, because he knows no better. Such a degrading life would drive an American farmer mad. The Frenchman thrives because he spends nothing. He has no wants beyond the coarsest food and the washings of the Grape-skins after the wine is made. Yet, he is thrifty. He saves money, too. The aggregated wealth of 30,000,000 poor, degraded, barefooted peasants make France rich. The ignorance of the French farmer is appalling. I never saw a newspaper in a French farm village. The Frenchman eats the coarsest food; about the same as he feeds his horse. He will eat coarse bread and wine for breakfast; soup, bread and wine for dinner, and perhaps, bread and milk for supper; he does not know what coffee or tea is. The negroes of the South live like kings compared to a French farmer. Still the Frenchman is satisfied, because he knows no better.

GARDENING IN JAPAN.

Except in the gardens of the Buddhist Monastery of Hangtse in China, I have never seen anything approaching in singularity to these productions, but the gardeners of Tokio are far more daring than the monks. Bushes and shrubs, cut into the life-size resemblances of men and women, are equipped with faces of painted wood or paper, the clothes, fans or weapons being formed of carefully trained leaves and flowers, which fall in artistic draperies of delightfully harmonized colors. In one scene a tree represents a monster fan, two others a bridge with a ship passing underneath it, then a landscape with a picnic, and a setting sun of gold-colored Chrysanthemums is wonderfully executed. Chinese women walking, and animals, especially hares and rabbits, are also represented by this singular art. Scenes from well-known plays are the most enduringly popular of all these scenes, and one of the mythic heroes of Japan, shown in combat with an eight-headed monster, while the lady, for whom he is fighting, sits apart, clothed in red, yellow and white Chrysanthemums, the whole forming a landscape over thirty feet long, is always the centre of joyous crowds in late October, when the sun is warm and the air is still.—*Unbeaten Tracks in Japan.*

MELONS IN SOUTH AMERICA.

The Musk Melon grown here, writes our correspondent, are not nearly as good as in the United States. And Watermelons, of which the variety chiefly grown resembles the Mountain Sprout, do not attain a large size, and in spite of the hot sun are lacking in sweetness and flavor.

Exhibitions & Societies.

NEW YORK HORTICULTURAL SOCIETY.

The leading feature of the February exhibition was the many beautiful Roses which covered the tables and filled the air with the breath of June. John Henderson's collection, comprising all the leading and several new varieties, all in excellent specimens, was awarded the first prize. A dozen Bon Silene from A. McKellar, Catherine Mermel from A. S. Burns, and a large bunch of La France from Eugene Dailedauze were as perfect as we ever saw these varieties. All were awarded first prizes.

Orchids came next in prominence. W. C. Wilson exhibited *Dendrobium Wardianum*, *Phalenopsis amabilis* and *grandiflora*, *Celogyne cristata*, *Lelia autumnalis*, *Oncidium tigrinum*, *Cypripedium longifolium*, and several varieties of *Calleya Triance*. Hallock & Thorpe showed *Dendrobium Wardianum*, *Lycaste Skinneri* and *Cypripedium Harrisianum*. Charles E. Parnell showed a large bunch of flowers of *Dendrobium amabile*.

Henry Sackersdorf exhibited a highly ornamental and tastefully arranged stand consisting of a straight stem about three feet high and covered with Smilax; on the top was fastened a tin vessel with water, hidden from view. In this were arranged long, blooming branches of *Acacia pubescens* gracefully drooping all around somewhat in the shape of an open umbrella. Another stand similarly arranged with *Euphorbia jacquiniiflora* was exhibited by William Daniels who showed also some unusually well-grown Poinsettias.

Hallock & Thorpe were as usual strong in Carnations and Geraniums, of both of which they showed large and remarkably fine collections.

A new seedling Carnation "Douglaston" which attracted much attention, and was awarded a first prize, was exhibited by Albert Benz. The flower is very large, perfect shaped, of light buff color and carmine striped. The same exhibitor showed also excellent bunches of Violets, Lily of the Valley and a new seedling Calendula, very large, deep orange and highly promising.

Siebrecht & Wadley's exhibit consisted of several miscellaneous collections, very fine Primulas, Hyacinths, Tulips, Orchids and others.

A collection of seedling Amaryllis exhibited by John A. Gardiner was one of the most meritorious features of the exhibition and deserves special mention.

The display of vegetables consisted of Mushrooms, Cauliflowers and Cucumbers. A plate of Anjou Pears, grown in 1884, still in perfect condition.

During the business meeting William Bennett recommended as an infallible remedy for mildew in greenhouses, to paint the hot water or steam pipes with a mixture of sulphur and linseed oil. Sulphur alone is frequently found to injure the foliage of the plants, but the addition of the oil is said to mitigate this effect.

The first spring exhibition will be held on Tuesday, March 3d, from 2 to 5 p. m., in Horticultural Hall, 26 & 28 West 28th street. Intending exhibitors may obtain premium schedules by addressing the secretary, J. Y. Murkland, 18 Cortlandt street, New York.

AMERICAN INSTITUTE FARMERS' CLUB.

The meetings of this club are held every second and fourth Tuesday of each month at 1:30 P. M., in room 24, Cooper Union, New York. At the meeting held February 10th, Mr. Peter Henderson read the following excellent paper:

HOW PORTIONS OF THE FARM MAY BE PROFITABLY USED FOR GROWING FRUITS AND VEGETABLES.

An experience of over thirty years as a market gardener and seedsman has given me opportunities for observation that enable me to speak understandingly on this subject. I believe it is safe to say, of my own knowledge, that there are hundreds of farmers in nearly all parts of the country each season who strike out from the old stereotyped crops of the farm into growing a few acres of either vegetables or fruits, and in many cases both and not a few have abandoned the farm for growing farm crops and have devoted their whole energies to the growing of fruits and vegetables.

Last week I had a visit from a man living in the vicinity of Rochester, N. Y., who came to thank me for advice given him a dozen years ago in this matter, when he timidly made the attempt of growing half an acre of his fifty acre farm in vegetables for a village market. His venture was so satisfactory that he gradually increased his area, so that he has now thirty acres used mostly in growing early Cabbages for the Rochester market. He further informed me that his net profits from the Cabbage garden were last year \$6,500, or a little over \$200 per acre, and that it was not a very good year for Cabbages at that. We market gardeners in the vicinity of New York would not be content with a profit of \$200 per acre on our high priced land, but it would be more than satisfactory to most farmers.

Another marked case where a farmer in the vicinity of Baltimore has been cultivating for six years past over one hundred acres in Hackensack Melons, which are sold in New York at prices that give him over \$5,000 a year profit from the same land that in Corn or Wheat did not net him one-tenth of that sum.

In another instance that came under my personal observation, a college bred man of twenty-eight, failing in health from office work, purchased a farm of sixty acres at Northport, L. I. three years ago. The second year he tried a few acres in vegetables and small fruits, which he found sale for in the village of Northport at most satisfactory prices. I was on his farm in the summer of 1883, and I must say that for a man who had obtained his knowledge almost entire from books his venture looked as if it would be a complete success. I will say, however, that he buckled up his sleeves and worked from sunrise to sunset. I have but little doubt that he will yearly increase his area for vegetables and fruits, and that his farm like hundreds more of those on Long Island will be eventually converted into a market garden for vegetables and small fruits.

The now famous Celery growers of Kalamazoo, Mich., were less than twenty years ago nearly all farmers who could scarcely make ends meet. Now the profits derived from the culture of Celery have made many of them comparatively rich, that is rich for tillers of the soil, for few such make mammoth fortunes, if we except their riches in

vigorous health and placid minds. In a paragraph from the Philadelphia Ledger of last week I find the following, in relation to Celery growing in Kalamazoo, Mich.: "What was a dozen years ago a swamp is to-day a vast Celery field, beside which a hundred acre lot is but a garden. The shipping season begins in July, increases until the holidays, then gradually decreases until the crop is disposed of in the spring. Fifty tons daily are now being sent out, and the crop of 1884 will reach five thousand tons. Twenty thousand stalks are raised upon an acre of ground." This is a very moderate estimate of the number of plants per acre, which is in reality probably one half more, as we grow nearly thirty thousand plants on an acre, which averages two cents per root wholesale, or six hundred dollars per acre. The 5,000 tons shipped from Kalamazoo bring probably \$150,000 annually.

Another case in point which has been communicated to me by a friend is as follows: His farm adjoined a village of two thousand inhabitants. One year when he had a large surplus of Strawberries and Sweet Corn which he had grown for his own family, and having many applications for the fruit and the Corn by the village people, he conceived the idea of employing a man with a cart to supply this unexpected demand in the village. These products were sold at such prices as paid a clear profit of \$175 per acre, which was about five times as much as the average value of the farm crops. In addition, the sale of the Strawberries created a large demand for cream which was equally profitable. No doubt this example could be followed in the neighborhood of nearly every village in the country.

It is not advised, however, that any farmer should in the beginning embark largely in growing vegetables and fruits. Nearly all who have been most successful have, like my Rochester friend, started with a small patch, increasing the area as their means and the demand for the products justified. Those who can most advantageously use their farms for the culture of fruits or vegetables are such as are located near towns or hotels, and large summer boarding-houses. As the fruits and vegetables usually furnished to such places are shipped from the large cities after passing through the hands of commission men, who of course must take their profit, usually they arrive in a stale and battered condition, and cost three times more to the consumer than the original grower gets. As a matter of fact the vegetables and fruits usually served at first-class hotels and fashionable summer boarding-houses fifty or a hundred miles from New York, where the guests pay three and four dollars a day, are no better than those to be found in the cheap restaurants in the large cities, though they have cost the proprietors three times as much. In the great majority of cases these crops could be grown profitably in the vicinity and served fresh from the ground daily.

In a paper necessarily as short as this must be, detail of operations cannot be given, nor is it necessary, for all that need be said on these subjects has been given in the hooks on fruits and vegetables already published. I will merely give a few leading instructions of the best conditions, and to do this I will take the liberty to quote from a work that I have just written.

"Whenever choice can be made the land used for such purpose should be as level as possible, and should be of the nature of what is known as sandy loam that is, a dark colored rather sandy soil overlaying a sub-soil of sand or gravel. All soils that have adhesive clay for their sub-soils are not so well suited for fruits or vegetables, besides requiring at least double the amount of labor for cultivation. Above all things necessary to success in growing either vegetables or fruits is manure. It may be laid down as a settled fact that unless manure can be obtained in sufficient quantity the work is not likely to be half as remunerative as where plenty of it can be had. The quantity of manure used per acre by market gardeners around our large cities is not less than seventy-five tons per acre each year, and if barnyard manure is not accessible, concentrated fertilizers such as bone dust or superphosphates should be harrowed in the land, after plowing, at the rate of not less than two tons per acre, if no other manure is used. Such large quantities of manure will no doubt be appalling to the average farmer, as it is no unusual thing for a farm of fifty acres to get no more than market gardeners put on a single acre; but everyone who has had experience in growing vegetables or fruits knows that the only true way to make the business profitable is to use manure to the extent here advised."

It is safe to say that the average profits to the market gardener in the vicinity of our large cities, where he annually pays sometimes as high as \$100 per acre for rent, is at least \$300 per acre. The usual amount of ground cultivated by market gardeners is ten acres, and they think it is a poor year when their profits from that amount of land do not average \$3,000, and that too when nearly all the products are sold at wholesale.

The kinds of garden products that would be found most profitable would be I think, in small fruits, Strawberries, Raspberries, Blackberries, and Grapes. In vegetables, Asparagus, Beans, Peas, Beets, Cabbage, Cauliflower, Celery, Sweet Corn, Cucumbers, Melons, Radish, Spinach, Squash, Tomato and Turnip. Of the varieties of these I will say nothing, as the kinds adapted to one location may not always be suitable in another. A good rule where you go to a nursery, seed or implement warehouse, if you are not well posted, is to ask the clerk what kinds he sells most of, be it fruit, plants, vegetable seeds, or implements, and you will be safe in choosing such, if you have no particular choice, for it is most invariably the case that the general public find out what has most merit and such too as would most likely be suited for most locations.

The reading of this paper, for which a hearty vote of thanks was tendered to Mr. Henderson by the club, was listened to with a great deal of attention by all present; and the discussion which followed as well as Mr. Henderson's answers, cheerfully given to the many questions put to him, were of much practical value and interest. We much regret that our limited space does not permit of a full report of the same.

Those of our readers living within convenient reach of New York, or whom on a visit should not miss to attend these meetings; they are entirely free, and all persons interested in horticultural and rural affairs are heartily welcomed.

AMERICAN POMOLOGICAL SOCIETY.

TWENTIETH SESSION.

The Michigan Horticultural Society having invited the American Pomological Society to hold its next meeting in Michigan, the undersigned give notice that the Twentieth Session of this National Association will be held in Grand Rapids, commencing Wednesday, September 9th, 1885, at 10 o'clock a. m., and continuing for three days.

All Horticultural, Pomological, Agricultural, and other kindred associations in the United States and British Provinces are urged to send delegations as large as they may deem expedient, and all persons interested in the cultivation of fruits are invited to be present and take seats in the Convention. It is expected that there will be a full attendance of delegates from all quarters of our country. No effort will be spared to make it the largest and most useful meeting ever held by the Society.

The Catalogue of Fruits published by the Society includes nearly all the States and Territories, and is filled with a great amount of information as to the fruits adapted for culture in the respective locations. Some of these are yet incomplete, and it is the object of the Society, from year to year, to fill the blanks and bring its Catalogue nearer to perfection. To accomplish this object as fully as possible, the Chairman of the General Fruit Committee, W. C. Barry, Esq., Rochester, N. Y., will send out the usual circulars of inquiry.

When we consider the great importance of fruit culture in North America, its rapid progress during the last thirty-five years under the beneficent action of this Society, the great value and rapidly increasing demand for its products at home and abroad, we feel warranted in urging the attendance of all who are interested in the welfare of our country and the development of its wonderful resources in this branch of agriculture.

Arrangements will be made with hotels and the railroads of Michigan for a reduction of fare. In most cases it will be best for delegates to arrange for rates with the roads in their localities.

An efficient committee has been appointed by the Michigan Horticultural Society to make all necessary arrangements for the exhibition of fruits, the reception and accommodation of the members and delegates of the Society. The committee consists of Hon. Byron G. Stout, Pontiac; Hon. H. G. Reynolds, Old Mission; Hon. A. J. Webber, Ionia; Hon. W. K. Gibson, Jackson; Hon. W. L. Webber, East Saginaw; Judge J. G. Ramsdell, Traverse City.

Good and ample accommodations will be furnished the delegates, the collections of fruits, and a convenient and quiet hall for the sessions.

In accordance with an invitation from the State Board of Agriculture, after the meeting, the members and delegates who desire it, will visit the Agricultural College.

The Society encourages an exhibition of choice fruits, especially new varieties or novelties.

It is earnestly requested that no duplicates appear in any collection, and that none but choice specimens be placed on exhibition. Exhibitors should not fail to give notice, as far as possible at an early date, what room

will be needed for their fruits. Six specimens of a variety will be sufficient, except in fruits of unusual interest. A limited number of Wilder Medals will be awarded to objects of special merit.

Packages of fruit should be addressed to Charles W. Garfield, Grand Rapids, Mich., for the American Pomological Society. Freight and express charges on packages prepaid.

All persons desirous of becoming members can remit the fee to Benjamin G. Smith, treasurer, Cambridge, Mass. Life membership, twenty dollars; biennial, four dollars. Life members will be supplied with back numbers of the proceedings of the Society as far as possible.

MARSHALL P. WILDER, Pres., Boston, Mass.
Prof. W. J. BEAL, Secy., Lansing, Mich.

AMERICAN HORTICULTURAL SOCIETY.

MEETING AT NEW ORLEANS.

One of the chief organizers of the New Orleans Exposition, and the head of the Horticultural Department is Mr. Parker Earle, president of the former Mississippi Valley now the American Horticultural Society and it was therefore not only fitting and proper but necessary as well, that the annual meeting of the society should be held at the Exposition. Many feared that the distance from central points and the overshadowing attractions of the city and Exposition would result in a failure of the meeting, but all such fears proved groundless, and the attendance was large and the papers and discussions were of wide scope and great value.

A very excellent opening address was made by President Earle, detailing the difficulties surmounted, and the work accomplished up to that date January 14th. An immense glass structure had been erected in which a fine collection of Palms, Orchids and Cactus were already in position; a collection of every known variety of American grape vines, and the largest and most interesting exhibit of Apples ever gathered in the world. There were Apples from all portions of the United States, from Canada, Manitoba, the Highlands of Mexico, England, France and Russia. Outside in the grounds were planted 200,000 Dutch bulbs, and over 8,000 varieties of American trees and shrubs.

Papers were read by C. B. Merwin of Tennessee, and Judge Wm. Parry upon *Cross-fertilization*, which with the discussion following fully proved that the male parent has a greater or less influence in Strawberries and other fruits that are a part or are immediately borne upon the receptacle the part influenced.

A paper by J. S. Collins of New Jersey brought out a full talk upon cold storage. Mr. Collins stated it to be the practice in his State, to store fruit in rooms below ice-houses. The drip was not detrimental to Apples and Pears. Berries were protected by covers. Concord Grapes are kept four to six weeks in New York, by placing them upon the ground and covering with a foot of leaves which were wetted daily.

E. Williams of New Jersey read an excellent paper illustrated with drawings on *Pruning the Vine*, followed by one from A. O. Kendel of Ohio, on the *Culture and value of our native Grapes*. A lively discussion upon Grape rot and bagging Grapes followed. Facts were given by A. J. Caywood and

others to show that bagging protected and paid, a part of the profits resulting from protection against birds, insects and early frosts. A thousand bags costing \$1.50 could be pinned on in a day by an active girl. Mr. Kendel thought the Catawba ripened two weeks earlier now than when first introduced into Cleveland thirty-five years ago. Mr. G. W. Campbell thought the facts did not bear out Mr. Kendel, although it was contrary to the laws of acclimation, the Catawba originating in North Carolina.

A paper on *Some Hints toward the Landscape Improvement of Country Homes* was read by L. B. Pierce of Ohio. Secretary Ragan said the paper filled a very important hiatus in the literature of the society and he was glad that it recommended the employment of native trees and shrubs. The cost of such was less while the beauty of many could not be exceeded. The lack of beautiful surroundings was a marked feature of too many homes in America and we should smile upon every effort and every word that threw light upon the subject. President Earle said he was glad the paper had been presented. Many began wrong end first in planting their homes. He would plant the ornamental first, the fruit bearing trees afterward. He could buy Apples, but he could not buy the changing and wonderful beauty that his evergreen trees presented at all times of the year.

E. T. Hollister of Missouri presented a paper on *Fraternity*; P. M. Angur of Connecticut on *Cranberry Culture*; F. S. Earle on *Fungoid Diseases of the Strawberry*; G. H. Wright of Iowa on *Forest Planting in the Northwest*, all interesting and all followed by instructive and valuable discussions.

Charles Gibb of Quebec and Prof. Budd of Iowa gave valuable information about Russian Apples and other fruits. Very interesting and startling facts were given in reference to the growth of Cherries in North-eastern Russia. Prof. Budd thinks "the time not far distant when the whole Northwest will grow Cherries as easily and plentifully as Tennessee grows Blackberries."

The tree agents became a subject of discussion and resolution, but no one could be found to condemn them totally, many thinking them to be something like the rum-laden ship that took out the first missionaries, a combination of evil and good. Prof. Riley gave an interesting lecture on insecticides.

Dr. Maurice, Commissioner of Jamaica, addressed the meeting on horticulture in that island. The Banana, he stated, was chiefly grown as a shade or nurse to protect young Coffee and Cocoa orchards; it costs \$25 per acre to plant Bananas, and the return was from \$50 to \$75 in eighteen months, and about the same annually for five years, when they no longer bare good sized bunches, and the room was needed for the growing orchards. Oranges grow wild every where in cattle pastures, and the first step in establishing a grove is to refrain from cultivation, when the young trees spring up and could be transplanted and grafted. A great many Cocoanuts are grown in Jamaica. They bare at eight years from planting, and yield an average of \$22. There are many fruits grown in Jamaica that might be objects of export did they not come at a period when American fruits were plentiful. Experiments are constantly going on in reference to canning and preserving these, and

introducing them to the great fruit markets of the world.

Among fruits that attracted a great deal of attention was the Japanese Persimmons. Many excellent specimens were shown from California and the South. Their carrying qualities are said to be such that, ere many seasons, we may hope to see them in northern city markets.

Altogether the month of January, 1885, was not only a red-letter month in the history of the American Horticultural Society, but in American Horticulture as well.

TALLMADGE.

MASSACHUSETTS HORTICULTURAL SOCIETY.

The Chairman of the Committee on Gardens, Mr. John G. Barker announces the following schedule of prizes for the year:

HUNNEWELL TRIENNIAL PREMIUMS.	
For an Estate of not less than four acres, which shall be laid out with the most taste, planted most judiciously, and kept in the best order, for three consecutive years, a prize of	\$160
For an Estate of not less than three acres, on the same conditions.	120
Second prize,	80
In gratuities,	40
	\$400

SOCIETY'S PRIZES.

For the Best Amateur Conservatory adjoining a Dwelling,	\$30
Second Prize,	20
For the best collection of Hardy Biennial and Perennial Herbaceous Plants,	20
Second Prize	10
For the best arranged and best kept Flower Garden	20
For the best Peach Orchard of one acre, with full statement of its planting, cultivation and production	30
Second Prize	20
For the best Vineyard of one acre, with a similar statement	30
Second Prize	20

NEW YORK STATE FORESTRY ASSOCIATION.

A meeting to form a State Forestry Association was held in Utica on February 21st. Several interesting and valuable papers were read, and resolutions adopted to the effect that it is the sentiment of the Association that the most careful legislation be had bearing upon the forestry of the state, and that in view of the great interests involved, immediate legislation should be had bearing upon the preservation of the forests from destruction by fire. The Hon. Andrew D. White, of Cornell University, was elected president, Dr. E. B. Southwick, New York, secretary. Among the vice-presidents we notice the name of the eminent veteran horticulturist, Patrick Barry of Rochester.

A CHARITY FLOWER SHOW.

A flower show for charity, to open on March 9 and continue three afternoons and evenings will be given by Dr. Klunder at Fifth avenue and Twenty-eighth streets. A large number of fashionable people will attend. The show, which is to consist principally of roses, will be highly attractive and many novelties in decorations will be on exhibition. Two hospitals are to be benefited by the entertainment.

AMERICAN HORTICULTURAL SOCIETY.

Under its new title, the Society's field of usefulness will be greatly enlarged, and it only remains for the friends of the organization to supply the much needed means for carrying forward the work now so well begun.

The first and second volumes of transactions, now before the world have received the highest commendations of practical horticulturists and pomologists. No pains

will be spared to make the next volume excel those in actual value. These books are distributed only to members (whose names, with post-office, appear in the volume) and to patrons of the Business Directory.

The Business Directory contains the names and post-office of the leading fruit-growers, nurserymen, florists, seedsmen, gardeners, fruit dealers and commission men, fruit canning and preserving establishments, manufacturers of horticultural implements, machinery, cold storage, manufacturers of fruit and vegetable packages, manufacturers of labels and nurserymen's supplies, etc., in the country. The volume will also give a roster of officers of all the principal horticultural and pomological societies in this country and the British Provinces. To any one engaged in business related to horticultural and agricultural interests this volume will be invaluable.

The annual fee of membership is \$2.00, and all applicants, to insure the publication of names in the forthcoming volume, should be made early, to the secretary, Prof. W. H. Ragan, Green Castle, Ind.

NATIONAL EXHIBITION OF HUNGARY.

In connection with this exhibition, which will take place at Budapest, this summer will be held an International Exhibition of Seeds, Cattle Food and Fertilizers. The special programme which has been received states that the object of this International Exhibition is to acquaint the Hungarian agriculturists with foreign products, and in the interests of the interchange of seeds, also with the foreign places of import, besides to furnish information of the foreign agricultural situations, and to facilitate to foreigners the securing of favorable markets for their products.

CHOICE SLIPS.

In former years all hot-beds were sunken in the ground, now the usual method is to build them on the level ground, except when made during winter, in which case they keep longer warm when lowered.

It is said that Potatoes when dug in an unripe state may be at times watery, and not fit to eat, but if spread as thinly as possible in a dry, airy place, they will in time become as mealy as if left to ripen in the ground.

Any one who has a spring or running stream on his land may have a delicious and wholesome salad the year round, by planting early in spring some slips of Water-cress along the margins.

Plant the most mature and perfect seeds of the most hardy, vigorous and valuable varieties, and as a shorter process, insuring more certain and happy results, cross and hybridize our finest kinds for still greater excellence. So says the Hon. Marshall P. Wildor, the venerable president of the American Pomological Society.

To prevent Hickory seedlings from forming strong tap roots which make transplanting very precarious, a writer states in the New York Tribune that he places a strip of tin in the bottom of a trench about ten inches deep, fills up with soil in which the dirt is pressed three inches deep. When the top root reaches the tin, he says, instead of going down it will make small fibrous, and the tree can be transplanted safely.

The Overflow.

We have such a store of good things this month that we are obliged to turn out a page full of them here as a sort of "overflow meeting."

Make your head serve your heels.

SPRING FLOWER FASHIONS.

Fashions in flowers were never more pronounced than this spring. The best patrons of florists in New York demand flowers that are fashionable, and no matter how beautiful are blossoms that are out of date, or thrown aside by bouquet makers, there is no sale for them among those who pay large prices and who purchase the cream of greenhouse growth. For this reason it is with trepidation that plantmen invest largely in newly imported or originated stock. They are not certain that the flowers will "take" and become fashionable; if they do not, they lose heavily.

CAMELLIAS.

The revival of Camellias is a marked feature of the latest floral fashions. For many years these beautiful, but odorless, blossoms have been antiquated, and rarely used. With the advance of English ideas in decoration in the metropolis, the Camellia has worked its way into high fame, especially when elaborate ornamentation with flowers and foliage is made in large apartments.

At one of the large balls given at Delmonico's lately, several English guests of nobility were entertained, and in their honor the Camellias were used profusely. The walls were frescoed with them, there were shields of them on the music balconies, and mirror frames were enameled with *C. Donckelari*, which is a crimson and white variety.

When the rage for large Roses started in New York a considerable number of Camellia plants were thrown out of greenhouses to make room for their rivals. For that reason the flower is not very plentiful, only a few growers having preserved their best specimens. The kinds most in use are *alba plena*, a double white; *Albertus*, white pencilled with pink; *Caleb Cope*, a blush color; *Chalmer's Perfection*, a bright pink; *elata*, dark crimson; *imbriata*, white equisitely fringed; *imbricata*, a deep carmine; and *Florida*, a cherry and white mottled.

Large hand bouquets of Camellias are extremely fashionable; these always have a cluster of fragrant flowers fastened to the stems to give the bunch odor. A bouquet made of pure white *C. imbricata*, had a cluster of white Violets tied with a white satin sash to the stem; it was the first Camellia bouquet carried in this city for a decade, among fashionable circles.

GOLDEN WEDDING FLOWERS.

Acacia pubescens is used with splendid effect in room decoration. For a golden wedding celebration lately, where only yellow flowers were placed in the drawing room, *Acacia pubescens*, made a superb show. There were panels of Canary Bird Tulips on the walls and the mantels were banked with

Narcissus, Trumpet Major and Perle des Jardin Roses. A fringing of *Mahernia odorata* drooped nearly to the fire-places, which were filled with specimens of this old-fashioned, but dainty, and highly perfumed plant.

BOUGAINVILLEA.

Bougainvillea spectabilis is always esteemed a novelty for decoration by leading florists who will buy every branch of it that is offered. Its color is so dazzling that it must be handled with discretion as it will destroy the effect of nearly every other flower placed in combination. At a recent reception, the parlors and corridors were garlanded with *Bougainvillea spectabilis* which was held where the festoons were looped by branches of *Lilium longiflorum* and cream colored satin rosettes.

SMILAX AND IVY.

Smilax is no longer the fashionable foliage. It became so common in markets and restaurants, and was used so freely in cheap decorations that those who lead the fashion in flowers will not have a string of it in their decorations.

Ivy leaves are now the staple foliage. They are used in garlands, and with Roses in all positions, when any beside their own foliage is demanded. A cluster of Ivy leaves is tied on the stems of all bouquets, their language "Friendship" making them favorites. What is known as Heidelberg Ivy, the leaves of which are thickly veined and often of ruddy color, is made into fringed sprays for Rose and Violet designs. Table scarfs of Ivy are a spring novelty for luncheons. They are made the same shape as plush table scarfs, being wider at the ends. Ivy leaves are sewed on to dark green silesia thickly and the ends are fringed with sprays of the young foliage or Lily of the Valley. After placing the scarf over the table, clusters of Violets, Lilies, or Daffodils are laid on the bed of polished leaves.

BOUQUETS.

Bouquet making is now one of the fine arts with the florist. The custom of sending a bouquet to the hostess on the evening of her entertainment, and of ordering this from her florist, who strives to make each one different, has started the energies of those in this department of flower weaving.

A florist lately made forty bouquets for a lady who gave a cotillion. They were every one made in perfect taste; one was composed of five hundred sprays of Lily of the Valley. In one side were perched three Japanese sparrows—pure white little birds with pink bills—stuffed. The bunch was bound at the stems with white satin ribbon, on which was stamped with gold the lady's name, and a large frond of *Adiantum Farleyense*. Stuffed birds are frequently placed in bouquets, only humming birds and Japanese sparrows, however. The latter cost five dollars each, adding considerably to the expense of the bunch.

Bouquets of La France Roses and pale Lilacs are very handsome. Jacqueminots are combined with Mignonette, and Catherine Mermet bunches are sprinkled with Lily of the Valley. Cornelia Cook Roses have superseded Niphetos in bridal bunches. The Cooks are grand in size and exquisite in tint and foliage this spring. A spray of Orange blossoms is fastened in one side.

Natural flowers are again used for ornamenting gowns and the coiffure. Camellias have been placed upon satin skirts to hold lace drapery and are handsome additions.

The little *Polyantha* Roso "Mignonette" is in lively demand for trimming children's frocks. A little girl wore a dress of pink silk tulle, the skirt drapery being caught with Mignonette Roses. She wore a wreath of the same flower. These tiny blush Roses are very scarce, few of them being forced this season by plantmen.

Pink and blue Larkspur are among the spring novelties besides single Poppies, Sweet Pea, and Bluets. The latter fringing Corn Flowers are snatched up at any price as soon as displayed by the florist.

FLORA.

PRUNING SHRUBS.

Shrubbery which has just been devastated by the shears of the amateur trimmer, tersely remarks a correspondent of the Philadelphia Press, calls forth a good deal of commiseration at this season. When the mania for cutting seizes the owner of uneducated shears he begins to set them at work to reduce every shrub to one form. The tops may all be shorn off level, or they may be clipped into globes or all the branches shortened in to give length. The one unvarying rule of procedure is to treat every plant in exactly the same way, and inasmuch as every plant has individual peculiarities and all the species have verified habits of growth, and are used for different purposes, the cast-iron rule of uniformity is fatal. No universal law can be laid down, but for shrubs grown for their flowers there are a few simple directions which no one should neglect.

The shrubs which bloom early in the spring should, of course, never have their pruning in the autumn. The flower buds of such varieties are formed on the wood made during the summer, and when those branches are cut off there can be no bloom, for no buds are left to open. Early flowering spiræas, for example, like the *Spiræa Thunbergii*, have buds almost ready to open now. In the warm days of early December some of them did open. But they will pass safely through the winter and be ready to burst into bloom under the influence of the earliest genial spring days. Wait till after they have bloomed and then cut them sharply in. This will encourage the growth of new wood—just the wood which will bear flowers the following year, and the yield will be abundant.

Late blooming flowers appear upon the growth made during the same year. Such shrubs can be pruned very early in the spring. Take the *Hydrangea paniculata grandiflora*, for example. Cut back the wood of last year to a couple of eyes. Then, during the next summer cut out the weakest shoots, and the result in September will be immense blooms at the extremity of every strong branch. The Late Flowering Tamarisk which, by the way, is much better than the other one in ordinary cultivation which flowers in June, when cut back on this plan makes amazing growth, and with waving plumes of the most delicate form and color.

But shrubs are not grown for flowers alone, and the time and method of pruning must be varied to suit the purpose intended. Study the habit of each shrub, and never lift the knife against one until you can give an intelligent reason for so doing. Consider the wild shrubs of the field. Many of them are invested with a rare charm, and yet no fussy gardener has ever "trimmed them into shape."

BOOK NOTICES.

Tillage is Manure, is the title of an interesting little pamphlet on this important subject, by the veteran John J. Thomas of the Country Gentleman, and published by Nash & Brother of Millington, N. J., and sent free by them "to those mentioning their advertisement." Mr. Thomas writes convincingly and well, as he usually does, and after reading his essay, one is apt to till the land more thoroughly. Mr. Henry Stewart also has an interesting history of harrows in the same pamphlet, also essays on "Fall Plowing" and "Grass Culture." Although an advertising brochure it is well worth sending for.

The Canadian Horticulturist of St. Catharines, Ont., dispenses good cheer in fruit and flower lore to a great circle of intelligent horticulturists in a climate where sound doctrine is especially necessary to success. Mr. Beadle is well fitted for his double work of editor, and secretary of the Fruit Growers' Association.

FRIENDLY WORDS.

The AMERICAN GARDEN is ably edited by Dr. F. M. Hexamer, one of the most scientific and thoroughly practical gardeners and horticulturists, both by the pen and spade, in America. It fairly sparkles and blooms in picturesque scenes and natural pictures of plants, flowers, and fruits. No one can carefully read such a monthly journal for a year without receiving practical knowledge worth ten times more than the dollar it costs.—Jersey Bulletin.

Send me two copies of the AMERICAN GARDEN for 1885. It is an excellent paper, and I hope it will give you as good satisfaction as it does to your subscribers.—J. G. C., Brisbane, Queensland.

This gem of a horticultural monthly has recently changed hands. Dr. F. M. Hexamer, the best authority of the day on gardening, broadly, whether for profit or pleasure, retained as editor, in connection with Mr. Libby, the publisher, who has had valuable journalistic, agricultural and horticultural experience, in connection with the Scientific Farmer, the American Agriculturist, Land and Home, and Chicago Farmers' Review. Mr. Libby has a rich field before him in his new enterprise, and with his proverbial industry, energy and perseverance, will labor earnestly to bring forth rich and abundant crops. Every one who has a garden, however large or small, will find valuable information in each number of the AMERICAN GARDEN worth more than the one dollar subscription price for a year.—Berkshire Courier.

CATALOGUES.

Plant Seed Co., St. Louis, Mo., takes its name from Mr. Alfred Plant and his predecessors of the same name, of good old Connecticut valley stock. Another instance of appropriateness of a man's name to his work. They issue a fine catalogue.

Southern Seed Co., Macon, Ga. A new concern which undertakes to introduce southern grown seed of many varieties for southern planting. Their catalogue comprises all the standard varieties adapted to that section.

Evart H. Scott, Ann Arbor, Mich. Price-list of small fruits. His specialty is the Woodruff Red Grape.

John Lewis Childs, Floral, Queens Co., N. Y., as usual sends out a complete and attractive catalogue of "new, rare and beautiful flowers." His growing trade is evidenced by the fact that the government authorities have established a post-office for him under the name of "Floral."

T. S. Hubbard, Fredonia, N. Y. Mr. Hubbard might claim the championship belt as "pusher of Grapes." He makes a specialty of this, the queen of fruits, and enjoys a large trade. His catalogue contains a great list.

Geo. W. Campbell, Delaware O., makes a specialty of the Lady Grape, but it is this year also pushing the Empire State. He has a great collection of Grape and other small fruit plants.

R. & J. Farquhar & Co., Boston, is a firm of young seedsmen who seem to be winning the confidence of gardeners and florists. They issue a good catalogue.

John Saul, Washington, D. C., is well-known as possessing one of the largest collection of ornamental plants in America, and his catalogue is almost a gazetteer of the species in cultivation.

Henry K. Simons, Greenfield, Mass., is an "intensive" gardener, as well as working bank officer. He grows a perfect host of plants on a quarter acre of ground, and issues a compact catalogue of flowers, seeds and plants.

Albert Benz, Douglaston, N. Y., is an expert grower of Pansy seed, one of the very few successful flower seed growers in America, and sends free to applicants a practical essay on Pansies.

Michael Plant & Seed Co., St. Louis, Mo., issue a large catalogue of plants and seeds.

A. Brackenridge, Govanstown, Md., makes a specialty of Orchids and offers a most tempting list of these rarest of plants.

J. Bolgiano, Baltimore, catalogue of garden, farm and flower seeds.

H. S. Anderson, Union Springs, N. Y., sends out a descriptive catalogue of small fruits and offers all the leading varieties.

Henry A. Dreer, Philadelphia, is the young manager of an old and reliable house, and sends out one of the largest seed and plant catalogues in the trade.

H. G. Corney, Cornwall-on-Hudson, N. Y., is the intelligent successor of E. P. Roe, the popular novelist nurseryman, and is making a worthy effort to keep up the well-earned reputation of his goods.

A. J. Caywood & Son, Marlboro, N. Y., are the originators of the Marlboro Raspberry, Poughkeepsie Red and Ulster Prolific Grapes and Minnowhaski Blackberry, which are highly commended by many cultivators.

W. H. Smith, Philadelphia, has a very full catalogue of seeds, plants, implements, etc.

W. H. Maule, Philadelphia, has several specialties in melons, and offers \$200 in cash prizes.

David Ferguson & Sons, Philadelphia. Select catalogue of greenhouse, hothouse and hardy plants and new plants of recent introduction.

Delos Staples, West Sebewa, Mich., has undertaken the unique business of introducing to cultivation the wild blueberry, with considerable success, and offers the plants for sale.

Samuel C. Moon, Morrisville, Pa. Descriptive catalogue of ornamental trees and plants, fruit trees, small fruits, etc., with instructions for culture.

Bloomington Nursery Co., Bloomington, Ill. Wholesale catalogue of trees, plants, shrubs, roses, bulbs, etc., comprising over several millions of fruit and forest trees and plants.

A. E. Spaulding, Ainsworth, Ia., lost heavily by fire last year, but now issues a neat catalogue of seeds, plants, bulbs, tools, etc.

Edwin Van Allen, Bethlehem Centre, N. Y. Annual price-list of choice small fruit plants, vines, etc., mostly grown by himself.

Frank Ford & Son, Ravenna, O., catalogue of small fruit plants, sound vegetable seeds, seed Potatoes, Grape vines, etc.

Edward Gillette, Southwick, Mass., makes a specialty of our native perennial plants, including Orchids, Shrubs, Climbers, and Alpine, aquatic and bog plants, rare Ferns, etc., for cultivation in the garden. A unique industry under a true love of nature.

J. W. Hall, Marion Station, Md. Descriptive catalogue and price-list of choice small fruit plants, trees, grape vines, etc., grown at the Somerset Fruit Farm and Nursery.

Irving Allen, Springfield, Mass. A compact illustrated catalogue of small fruit plants, fruit trees, etc.

Aaron Low, Essex, Mass. Catalogue of garden, field and flower seeds, including many "novelties."

John Perkins, Moorestown, N. J. Catalogue of hardy fruit trees, vines and plants, from the Fairview Nurseries, which comprise 200 acres or more.

Schlegel & Fottler, Boston. Fottler's Brunswick Cabbage originated with Mr. Fottler's father, and is still pushed by the son and his partner. A full catalogue.

George H. Colvin, Dalton, Ga. Catalogue of seeds, plants, and small fruit plants, for the farm, field and garden.

John R. & A. Murdock, Pittsburgh, Pa. Established 1840. Spring catalogue of seeds, trees, plants and tools. A full list.

George S. Wales, Rochester, N. Y. A good catalogue of fruits and flowers, from a reliable nurseryman, as we believe all are that advertise in the AMERICAN GARDEN.

F. L. Wright, Plainfield, Mich. Price-list of Grape vines and small fruit plants, "grown in a northern climate."

C. E. Allen, Brattleboro, Vt. Catalogue of northern grown flowers and vegetable seeds and plants.

E. D. Putney, Brentwood, N. Y., sends free a concise essay on Strawberry culture.

Edwin Allen, New Brunswick, N. J. Price-list of fruit, forest and ornamental trees and plants.

D. R. Woods & Co., New Brighton, Pa. Illustrated catalogue of Roses and other flowering and ornamental plants.

George L. Miller, Stockton, O. Descriptive catalogue of Strawberries, Raspberries, Blackberries, Grapes, etc., Fruit Farm and Nurseries.

Bowker Fertilizer Co., Boston and New York, issue two interesting and valuable pamphlets. They give many reports of experience by farmers and gardeners who have used these manures.

H. J. Baker & Brother, New York. "Facts for farmers, regarding the use and results of fertilizers." V. H. Hullock, Son & Thorpe, Queen, N. Y., may well be proud of the 180 premiums won by them for 1884. Their catalogue is a gem in its way, and that is a practical essay on "The Chrysanthemum, the Queen of Autumn." Its cover is artistic, tasteful and handsome.

Invite your friends to take a seat in our Garden. That is, get them to join our circle for three months and take home with them a Marlboro Raspberry Plant. See offer on page 63.

Down with the needless fences.

TRADE NOTES.

ITEMS OF GENERAL INTEREST FROM THE SEED, NURSERY AND FLOWER TRADE ARE SOLICITED.

Jos. Breck & Son of Boston report trade opening briskly in seeds.

Black Mexican Corn seed seems to be scarce among the seedsmen.

Seedsmen report that Lima Bean seed is more uniform than usual, and of excellent quality.

Parker & Wood of Boston have made some important improvements in their store, so that now it is light, roomy and convenient.

Messrs. Peter Henderson & Co., have doubled the size of their stores in New York in order to increase their great and growing trade.

The Niagara Grape and the Marlboro Raspberry ought to have a great sale this year as nearly all the nurserymen are advertising them liberally.

Mr. Chas. A. Green of Rochester, N. Y., reports a larger number of orders for his publications and fur nursery stock than ever before received since he began the business.

Mr. Wm. Henry Maule, who has for some time past been the only member of the firm of Benson, Maule & Co., Philadelphia, has changed the firm name to Wm. H. Maule.

Johnson & Stokes of Philadelphia are fitting up a fine new store at 219 Market street. It is five stories high and contains five times as much room as their present quarters.

We get greetings and endorsements from the horticultural trades in every direction, for the improvement in THE AMERICAN GARDEN, and the impartial manner in which it is conducted.

At the auction sale of the stock of the late firm of Messrs. B. K. Bliss & Sons, the register of names, lease, fixtures and catalogue plates, i. o. the "good will," were purchased by Messrs. Peter Henderson & Co.

Our friend Chas. V. Mapes of the Mapes Fertilizer Co., of New York, is a progressive thinker, heartily in earnest in the development of intensive farming, and one of the shrewdest advertisers in the trade.

We went over the stores of W. Atlee Burpee & Co., in Philadelphia, the other day, and most say that we never saw more complete and perfect arrangements for the prompt, accurate and economical filling of orders.

Prices of seeds have not been lower than now since the seed trade was conducted on the honorable basis it now occupies for the most part. Never before could good and true seeds of all kinds be bought so low as now.

A. D. Cowan & Co., of New York, whose advertisement of Peas last month was cut in two by an unruly rule in the hands of a beruled printer, state that they have a very superior stock of the varieties they advertise.

The Golden Gem Melon has become very popular with the Philadelphia market gardeners—it having largely taken the place of the Jenny Lind for early marketing. We tried it when first introduced and found it of extra fine quality.

Mr. A. Brackenridge of Govanstown, Md., well known as a leading commercial florist, has purchased over 7,000 plants from the exhibit of Cnatemla at New Orleans. It comprises many rare and valuable plants from the tropics.

Messrs. Hovey & Co., of Boston will introduce Breesee's Advance Potato, which took first prize at the Massachusetts Horticultural Society's show in 1882 as the best new variety. We have tried this Potato and found it excellent in its form, quality and productiveness.

The bidding of western houses for eastern trade and of southern houses for northern trade as well as the reverse, shows a growing community of feeling between the different sections, and very pointedly marks the development of horticultural pursuits in the West and South.

The idea prevalent a few years ago that northern grown seeds of all species were best for both northern and southern sections, is refuted in part by the success of certain southern seed growers. They have shown that they can grow seeds of Pepper, Tomato, Egg Plant, Melon, etc., and many flower seeds, especially the seeds of many plants of semi-tropical origin, quite as well as their northern brethren.

But whether earliness and quick maturity can as well be secured with southern grown seeds, even of southern species, is yet to be proven.

WE BRING GOOD LUCK

To all of The American Garden family of readers. Good fruit, good flowers, good vegetables, good gardens, good lawns, good health, good profits and good pleasure to all who read and act intelligently.

The Publisher's Corner.

THE AMERICAN GARDEN. Subscription Terms.

To any address in United States and Canada, postpaid, one year, \$1.00
Six months 60 cts., three months .30
To any foreign country in the Universal Postal Union and all British Colonies, postpaid, one year, \$1.24
For \$5.00 we send 6 copies one year.
For \$7.50 we send 10 copies one year.
Subscriptions may begin at any time.
The magazine is not sent after subscription expires unless by special arrangement.

If you will send us a club of three month subscriptions during March, you may win an offer on this page of 100 Marlboro Raspberry Plants, or 4 Niagara Grape Vines.

MANY THANKS, KIND FRIENDS.

Those very-much-in-earnest friends of progressive Horticulture who have shown their interest by sending clubs of subscriptions for THE AMERICAN GARDEN, we have written down in our red-letter book of memory, with the check mark of GOOD LUCK opposite their names, which we shall help them to by every means in our power.

THOSE SUBSCRIPTION BLANKS

Are not Duns.

Some subscription blanks got enclosed in a portion of our February edition by inadvertence, and sent to subscribers who had renewed their subscriptions, but which were intended only for those who had not already subscribed for 1885. Please pardon the oversight. If any reader who has received that blank will kindly pass it to some non-subscriber, it may help him to make up his mind to join our Good Luck family.

THIRTY-TWO PAGES.

Again a Rush.

Keen-sighted, wise, honorable, high-class advertisers of horticultural wares, seeking the attention of the intelligent and progressive Good Luck family of THE AMERICAN GARDEN readers, compels a still further increase in size, this time to thirty-two pages, or with the cover thirty-six pages. By this means we give our readers nearly twenty-three pages of valuable reading matter instead of the usual fourteen pages, and about twelve pages of as good and reliable a directory of dealers in farm and garden supplies as can be found anywhere.

We know that our readers, the friends of THE AMERICAN GARDEN and of American Horticulture, will rejoice with us in these signs of prosperity.

SUBSCRIPTIONS COME IN SLOWLY, *We are sorry to Confess.*

But yet we feel sure of a positive increase in the number of THE AMERICAN GARDEN circle for 1885. We know that the great delays in western mails have effected our returns, and expect a little flood of orders when the blockade is raised.

The former publishers of THE AMERICAN GARDEN lost many thousand dollars on this publication, chiefly, we suppose, because of the apparent self-advertising motive of the enterprise at that time.

Now we believe our readers are anxious to promote the cause of horticulture and rural life, and that you will gladly speak a good word for our work to your friends, for their sake as well as ours.

Please note our offers on this page, by which we show our appreciation of any good words spoken and good work done for THE AMERICAN GARDEN.

OHIO SEEDS FRUIT TREES AND PLANTS FOR ONLY

THE AMERICAN GARDEN SUBSCRIBERS.

For Good Words Spoken in a Good Cause.

So general has been the response to our great seed and plant offer of last month, that we now extend the limit of time to 30 days longer. You see that we meet you more than half way! Now if you will just secure the subscriptions of one, two, or more, of your neighbors or friends we will send to you in return for your kindness:

Offer open for 30 days.

LIST 1.

For one new subscriber at \$1.00 each, your choice of \$1.00 worth of seeds, from the catalogue of any seedsman who advertises in the AMERICAN GARDEN; except "special offers" of the dealers. Two subscriptions will give you \$2.00 worth; five subscriptions \$5.00 worth, and so on.

OR

For one new subscriber at \$1.00, one dozen strong plants of the famous Marlboro Raspberry, (price \$1.50 per doz.) Or a strong plant of the famous Niagara White Grape Or any four of the items mentioned under List 2.

For two new subscribers at \$1.00 each, two strong plants of the Niagara White Grape (retail at \$2.00 each). Or two dozen plants of the Marlboro Raspberry. Or any ten of the items mentioned under List 2.

OR

You can take your choice of any of the presents offered in List 3.

This offer is ONLY FOR OUR SUBSCRIBERS, but,

Any person not a subscriber who wishes to take advantage of the above liberal offers has only to add his or her own name to the number required, and select a present for himself from List 2.

Every new subscriber at \$1.00 has the privilege of our seed and plant offers in List 2.

This offer is necessarily limited to 30 days from date of receiving this number of the magazine by our subscribers.

How to Get the Seeds. Send to a seedsman for his catalogue. Select the seeds wanted. Get subscriptions enough among your neighbors to equal the amount of seeds wanted. Then send us the list of seeds and the subscriptions. We will order the seeds from the seedsman sent direct to you, and pay for them ourselves, and enter the subscriptions on our books.

FOR A TRIAL TRIP.

WE WILL GIVE

100 Marlboro Raspberry Plants

To the person (a subscriber) who will send us, during March, the largest number of three-month subscribers to the AMERICAN GARDEN at 30 cents each, every one of the subscribers also to have a Marlboro Raspberry plant, (the lowest retail price of which is 35 cents). Don't YOU want to get a plantation of this now famous Raspberry, and get one also for each of your neighbors, and help THE AMERICAN GARDEN at same time?

For the second largest club of three-month subscribers, as above, we will give four strong 2-years-old Niagara White Grape vines and a Marlboro Raspberry plant to each subscriber in the club. Don't YOU want to start a vineyard of this valuable grape?

THE PLANT AND SEED PREMIUMS.

Will be sent in due time for use.

The plants in spring after danger of frost is past, unless otherwise ordered, and the seeds in ample season for planting at their proper dates. This is in answer to many questions.

FIVE YEAR SUBSCRIPTIONS.

Any person who desires to try the Marlboro Raspberry, or the Niagara Grape, can get three dozen strong Marlboro plants (the lowest retail price of which is \$1.50 per dozen), or two strong 2-year plants of the Niagara, by sending a five year's subscription to THE AMERICAN GARDEN, and \$5.00. In the one case he gets the magazine for five years for only 50 cents, and in the other for only \$1.00. On this offer the subscription of any present subscriber would simply be extended for five years.

THE NIAGARA WHITE GRAPE

AND

THE MARLBORO RASPBERRY.

Our unequalled offers of these famous new fruits are this month more liberal than ever by reason of the recent reduction in price of the Marlboro Raspberry by the parties controlling its sale.

Just think of it! A \$2.00 Niagara Grape vine, No. 1 in quality, under seal of the Niagara White Grape Co., in return for only the few words required to get one new subscription from a neighbor for THE AMERICAN GARDEN!

Or one dozen strong plants of the Marlboro Raspberry direct from the originator for only one new subscription!

Please read the offers, and then please treat yourself to these valuable plants.

CHINESE YAM.

Many people would like to try this very old but little known, though much written of vegetable. Dr. Hexamer, the editor, grew a few of them last year which he wishes to distribute among THE AMERICAN GARDEN family. We therefore offer to any one who will send us a subscription (at \$1.00) other than his own, 50 good bulbs of the Chinese Yam, sent postpaid; or 200 for 3 subscriptions. (Cost at retail \$1.50 per 100.)

The American Garden three months and a Marlboro Raspberry for 30 cents.

The American Garden will be sent to your friend for three months, and also a plant of the Marlboro Raspberry for only 30 cents.

TO STRANGERS AND CHANCE ACQUAINTANCES OF THE AMERICAN GARDEN.

Several thousands of you will receive this number of THE AMERICAN GARDEN as a compliment to your interest in horticulture. Please examine it carefully. * * * (Pause for examination.) * * * Now how do you like it? Is it worth \$1.00 a year to you? Isn't there \$1.00 worth in this one number? "Yes?"

Then of course you want to subscribe for a year. You have only to enclose a dollar bill (It is quite safe in the mails now), select a present of seeds or plants (worth 25 cents to \$5.00) from List 2 on page 63, write your name and send us the order. The seeds will be sent at once, the plants in spring unless wanted now, and THE AMERICAN GARDEN every month in the year.

And you will get many times you money's worth, and be helping to promote the cause of good fruits, nice vegetables, beautiful flowers and rural improvement, by supporting the only independent, popular, special journal of horticulture in America.

Presents to every Subscriber.

Though we do not believe in premiums given to induce people to pay a dollar for a periodical worth many times that amount, yet in the present competition among publishers we are impelled to offer these inducements in order to get people acquainted with a magazine which they are likely to stick by for many years thereafter.

LIST 2.

A PRESENT TO EVERY SUBSCRIBER TO

The American Garden

We will send free, postpaid, to every subscriber at \$1.00 his choice of one of the following lots:

- SEEDS. No. 1. Wild Garden Seeds: half-ounce packet of 100 varieties choice flower seeds; cost \$5.00 in single packets. No. 2. Pansy, Perfection: splendid, large, vigorous. No. 3. Everlasting Flowers: seeds of 12 distinct sorts. No. 7. Ornamental Grasses: seeds of 12 best varieties. No. 8. Pea, Bliss's Ever Bearing: 1 packet; new, very prolific, excellent quality. No. 9. Pea, Bliss's Abundance: 1 packet; new, early, dwarf, very fine. No. 10. Chou de Bergley: 1 packet; new vegetable here, hardy. No. 11. Onion, Giant Zittau: 1 packet; from Europe, handsome, enormous size, pleasant flavor. No. 12. Water Melon, American Champion: 1 packet; highly recommended. No. 13. Potato, Dakota Red: 1 tuber; a promising new sort; late; very prolific; of high quality. No. 13A. Marlboro Raspberry: 1 strong plant of this famous new sort; from the originator. No. 13B. Parry Strawberry: 3 plants; new; very large, beautiful, high quality, perfect flower. (Price \$2.50 per dozen). PLANTS AND BULBS. No. 14. Triloma uvaria (Red Hot Poker Plant, or Flame Plant): one of the best hardy plants. No. 15. Calla Ethiopica (Lily of the Nile): a strong root of this stately plant. No. 16. Clematis crispa: beautiful, new, flowers 1 to 1 1/2 inches across, lavender blue and white, delicious perfume. No. 17. Tigris grandiflora alba (New white Tigris): a splendid acquisition. No. 18. Lily of the Valley: 6 flowering crowns of these dainty plants. No. 19. Clematis coccinea (Scarlet Clematis): grows 8 to 10 feet in one season, coral red flowers. Choice of 50 cents' worth of seeds in packets from the catalogue of any seedman advertising in THE AMERICAN GARDEN.

PREMIUMS.

TO THOSE SENDING SUBSCRIPTIONS TO THE AMERICAN GARDEN.

We offer a choice from any of the following valuable articles to all who will send the number of subscriptions named with each article. Everything described is first-class in every way, and can be fully relied upon. Great care has been exercised to offer none but the best and none but those possessing great merit.

Almost any one can in a few hours gather names enough to get some valuable needed article Without Expense.

REMEMBER. that EVERY SUBSCRIBER in the clubs will receive one of the valuable presents of seeds and plants above enumerated, if asked for when the subscriptions are sent. Address all orders to

E. H. LIBBY,

NEW YORK, OR GREENFIELD, MASS.

LIST 3.

Greatly Reduced Rates for 30 Days.

If you are a subscriber, see list 1 on page 63. A. Niagara White Grape: We will give a strong plant of this famous new white grape, unquestionably the finest white grape for general purposes yet produced, for only 2 subscriptions at \$1.00 each. Sent by mail prepaid.

For 5 subscriptions at \$1.00 each, we will send 3 strong plants. (Lowest retail price, \$2.00 each.)

B. Marlboro Raspberry: The largest early raspberry; new; superior as a market berry; now creating much interest among fruit growers. For 4 subscriptions at \$1.00 each, we will send 48 strong plants; for 8 subscriptions, 100 plants.

C. Novelty Collection No. 1. All for 10 subscriptions at \$1.00 each. (Regular price \$18.00.) One doz. Marlboro, the largest early raspberry. One doz. Hansell, earliest and best of all raspberries. One doz. Wilson, Jr., the largest early blackberry. One doz. Lucretia Dewberry, large, early, hardy, prolific. One doz. Early Harvest earliest of all blackberries. One doz. Centennial Black Cap, large, early, luscious. One doz. Cornelia, the best late strawberry. One doz. Parry, the best of all strawberries. One two-year Niagara, best of all white grapes. One two-year Jessica, best of all early grapes. Sent by express, or free by mail for a club of 12 subscribers.

D. Novelty Collection No. 2. All for 7 subscriptions at \$1.00 each. (Regular price \$10.00.) One doz. Marlboro Raspberry. One doz. Early Harvest Blackberry. Half doz. Wilson Jr. Blackberry. One doz. ARE YOU READING ANYTHING?

"THE AMERICAN GARDEN" IN CLUB WITH OTHER PUBLICATIONS.

If you want any of the following leading publications for 1885, we will send them in club with AMERICAN GARDEN for the prices named in the last column. This offer is good for both new and old subscribers. And all club subscribers are also entitled to the seed and plant premiums offered to each subscriber under List 2 on this page.

A. Publisher's price for both. B. Our price for both, including seed premiums of The American Garden.

Table listing various publications and their prices under columns A and B. Includes titles like American Agriculturist, Arthur's Home Magazine, Atlantic Monthly, etc.

If you want more than one of the above or any other publications in club with THE AMERICAN GARDEN, we will give prices on application. Address, E. H. LIBBY, NEW YORK, OR Greenfield, Mass.

EARLY ARLINGTON CELERY.

This new celery described on page 48, is said to be an improvement on the Boston market in earliness and hardiness. We are enabled by the only grower of the seed to offer a 25 cent packet to any person who will send us one 6-months subscription (at 50 cents), or three packets (value 75 cents) for only one yearly subscription at \$1.00.

FRUIT FACTS AT FINE FIGURES.

Mr. Chas. A. Green, that pleasing writer on fruit culture, has produced a remarkably sprightly and valuable book on "How to Propagate and Grow Fruit." Mr. Green also edits that bright and interesting quarterly, Green's Fruit Grower. The price of the book is 50 cts.; of the Fruit Grower 50 cts. We send the book, the Fruit Grower and THE AMERICAN GARDEN, all for \$1.20.

"HOW THE FARM PAYS."

In our general 30-days reduction for clubs we offer to send this new book to any one sending us only 3 subscriptions at \$1.00 each. The retail price of book is \$2.50. See review in December number.

Please notice the offers of Marlboro Raspberries and Niagara White Grapes for three-month subscriptions on page 63.

FRIENDLY WORDS.

With no more information and experience than I obtained from its pages I have met with highly satisfactory success in raising flowers.—W. F., Brooklyn, N. Y.

I find it invaluable; go on in the good work. It should be in every home.—B. F. O., Mountain View, N. J.

I admire the AMERICAN GARDEN greatly, and should feel much disappointed to miss a single number.—Dr. T. H. Hoskins, Vt.

I like the paper exceedingly.—H. R. A., Fort Fetterman, Wyoming Ter.

Since I have followed its advice I have met with success generally.—J. M. H., Squiresville, Ky.

I find it full of instruction, and its reading eminently pleasurable and elevating.—E. P., Sanford, Fla.

I am much pleased with the AMERICAN GARDEN, and am certain I can get ten or more subscribers for it here.—A. C. B., Dunedin, New Zealand.

I cannot be a single month without the AMERICAN GARDEN. I like it more and more the oftener I read it.—S. G. M., Wylliesburg, Va.

I have been much interested in the AMERICAN GARDEN and have no reason to fear deterioration from its change of ownership.—S. W. S., U. S. Treasury Dep., Washington, Dear Hexamer:

Has been a valuable coadjuter in the cause of horticultural progress, and we wish it a long-continued success.—Gardener's Monthly.

The AMERICAN GARDEN was good when you first took hold of it—it has grown better ever since; it will now positively be best. In brief I know, with you and Mr. Libby hitherto in double harness, the AMERICAN GARDEN will stand through the land as the chariots of old, and all will stand and behold with amazement.—Jno. T. Lovett, Little Silver, N. J.

I am fully persuaded that if its literary standard and general get up is maintained, that it shall make considerable headway amongst a certain class who formerly looked upon it as being to a great extent published in the interest of furthering the business of the former publishers.—Mansfield Milton.

For those interested in floriculture and horticulture there are few if any, more valuable publications than the AMERICAN GARDEN. It is handsomely printed and carefully edited.—North and South.

Among the horticultural monthlies that come to us, there is none welcomed with more pleasure than the AMERICAN GARDEN. The farmer will find in each number something that he can profit by, while to the professional and amateur gardener it is simply indispensable.—Iowa Churchman.

Has done effective work in the cause of advanced horticulture. It gives promise of becoming still more worthy the support of those who love nice fruits, beautiful flowers, healthful vegetables and pleasant homes.—Forest, Forge and Farm.

A conspicuous success.—New England Homestead.

SAM GREEN MAKES A RESOLUTION.

While Sam Green weeded, and dug, and hoed,
But had no luck with the seeds he sowed,
His friend, Jim Browning, across the fence,
Was glad at sight of his crops immense.
Glad, yet sorry, was Jim in his heart,
That his neighbor, Green, should stand apart,
With envy gnawing beneath his ribs,
When he thought of big Jim's bursting cribs;
Of all good things which seemed to have flown
Over to Jim's place, out of his own.

"Now, Sam," said Browning, "I tell you what,
I'm a going to lose more'n half I've got,
Unless you borrow what there's to spare;
So, fetch your teams, and draw home your share.
I haint forgotten ten years ago,
When wife and I, in the great big blow,
Lost all we had but the bare red land,
And you were the only friend at hand;
As you dealt by me in that day of need,
Let me deal by you, old friend, indeed!"

Then Sam was softened. He said, "O, Jim,
It isn't because my crops are slim
I envy you, but because you stick,
Year in, year out, to your favorite VICK;
While I, like a fool, now here, now there,
Buy seeds, and am cheated everywhere."

"Almost," said Jim, with a great, broad smile
On his homely face. But Sam said, "I'll
Buy no seeds, never, of none but VICK;
There's no use talking, I am just sick!"

ROCHESTER, N. Y.

If in want of Seeds, send 10 cents for Vick's Floral Guide, and deduct this amount from first order sent for seed. JAMES VICK, Rochester, N. Y.

The Three Best Peas
For Successional Crop.
Warranted Original Headquarters Seed.

Bliss's EVERBEARING PEA.

Bliss's American Wonder. The earliest, dwarfest and sweetest. Pkt. 10c, qt., 40c.; by mail 65c.

Bliss's Abundance. One of the most productive and richest marrow. Pkt., 10c., qt., 75c.; by mail \$1.00.

Bliss's Everbearing. This fine general crop pea continues longer in bearing than any other, retaining its delicious tenderness until the last picking. Per pkt., 10c.; qt., 75c.; by mail \$1.00.

Special Inducements to Readers of this Paper.

We will send by mail postage-paid, one quart each of the above three new varieties of peas upon receipt of \$2.50 in postage stamps, or money order; and in addition allow each purchaser to select Flower Seeds from our illustrated catalogue to the value of \$1.00. This substantial offer is made with the view of introducing ourselves to the readers of this valuable horticultural journal, and at the request of its new manager. As it only stands good until our stocks are sold the necessity for taking early advantage of it is apparent. Our catalogue containing "only the best seeds" for farm and garden will be mailed free to all applicants.

A. D. COWAN & CO.,
P. O. Box } 114 Chambers St., N. Y.
2541.

The houses of A. D. Cowan & Co., and W. H. Carson & Co. having been recently consolidated, the managing staff consists only of practical seedsmen, and comprises the following well known names:

THOMAS W. LUDLOW, Yonkers, N. Y.

GRAPE VINES OF OVER 100 kinds.

Nursery established 28 yrs. Delaware, Concord, Lady, Empire State, Niagara, Vergennes, Hayes, Early Victor, Lady and all the best, new and old varieties. Splendid stock. Prices low. Catalogues free. GEORGE W. CAMPBELL, Delaware, O.

15 Pkts. of new and fresh vegetable seeds for 25 cts. also our catalogue. VIC, KEEN & CO., Box 1254, PHILADELPHIA, PA.

LOVETT'S Bouquet Collection of BEAUTIFUL BERRIES

\$8.50 for \$5.00 by Mail, or by Express \$4.50.

The object of this remarkable offer is to bring these invaluable Berries before the public, and introduce my plants to new customers. After testing hundreds of varieties, I have chosen the following as the best of all the SMALL FRUITS, all things considered. At the prices asked by travelling agents the collection would cost over \$20.00.

PARRY. Now being introduced by the originator and myself. It has more points of excellence than any other Strawberry. A seedling of Jersey Queen and a vast improvement upon that famous sort; the blossoms being perfect, the plant prolific with the growth, large size, beauty and high quality of its parent.

OLD IRON-CLAD. Of recent introduction and the most desirable and valuable of all Strawberries, either for the garden or market, ripening early. It is among the earliest, of good size, good quality, firm and pretty.

EARLY HARVEST. The earliest of all Strawberries, and one of the greatest acquisitions of the age. Ripens with Wheat—weeks in advance of all others—of good quality and an extra good shipper. Comes very hardy and produces the most enormous crops.

CUTBERT. Now the most popular of all Raspberries. No other has yet proved of such universal adaptability; hardy in winter and a wonderful vigor during summer; berries always large, handsome and abundant.

SOUHEGAN. The earliest and most valuable of the Black Raspberries for home use, market or drying. Berries just black of good size and quality; causes strong growth, iron-clad hardness, and so prolific that the rows appear black with the fruit.

FAY'S PROLIFIC. Undoubtedly the finest of all Currants for any purpose. It equals in size well known Cherry, is longer in bunch, of the same sparkling red, less acid and of better quality.

HANSELL. Now being introduced by myself and myself. It is the most wonderful of all Raspberries. Earliest of all to ripen of any color or kind, large, bright crimson, vigorous, endures the severest cold, intense heat and prolonged drought without leaving nothing to be desired. The Raspberry for everywhere to plant, North, South, East or West, whether wanting fruit to eat or sell.

GREGG. The largest and best late Black Raspberry, and to have almost revolutionized the culture of this fruit. Causes robust and yield heavily to its soil.

TAYLOR'S PROLIFICO. The largest Blackberry, with an iron-clad cane, large, handsome, and excellent; ripens late. Causes of strong growth, very prolific and free from all diseases. The best Blackberry for main crop—especially North.

One dozen of each of the eight varieties of Strawberries and Raspberries and two plants of Fay's Currant, with Postage, amounts to \$8.50; but I will send by Express this entire collection for \$4.50, or by Mail for \$5.00. Half the number of each variety will be sent by Mail for \$3.00. Details allied with all applicants. IN ADDITION, all who order one of these collections will be presented by Mail, with the picture "Lovett's Bouquet of Beautiful Berries," portraying in oil colors, the fruit of the nine varieties named, artistically arranged in the form of a bouquet. It will be mounted, 9x12 ins., ready for framing and is worth the cost of the whole collection for its beauty, besides affording the satisfaction of seeing what the fruit will be.

LOVETT'S GUIDE TO FRUIT CULTURE

Is a book of over seventy pages, profusely illustrated and elegantly printed; contains descriptions of all the best fruits, new and old, the most important of which are accompanied with an engraving of the variety; and the best of all is, that both the descriptions and pictures are truthful. It gives explicit instructions for planting and pruning, and a fund of other information on culture and other matters, valuable to all interested in fruits. Price, with six colored plates, 10 cts.; without plates, 5 cts. Price Lists Free. J. T. LOVETT, Little Silver, New Jersey.

JAPANESE PERSIMMONS.

TREES at low prices, both one and two years old. A full assortment of named varieties, described in LOVETT'S GUIDE TO FRUIT CULTURE with Colored Plates, 10 cents; without plates, 5 cents. Price List Free. J. T. LOVETT, Little Silver, N. J.

BURPEE'S SEEDS ARE WARRANTED FIRST-CLASS—in every RESPECT, FEW EQUAL. —NONE BETTER.— FARM ANNUAL FOR 1885 will be sent FREE to all who write for it. Beautiful Fairy Roses

From Japan, that wonder land of Horticultural Beauty, something every one can succeed with! Sure to give satisfaction! They bloom in immense clusters, 30 to 50 together on a single stem. The flowers are of singular purity, and resemble miniature carnations. In their regularity, they are wonderfully beautiful and bloom constantly, and are entirely distinct from every other rose, and must become very popular. They are elegant, blooming as freely as geraniums and require as little care.

4 beautiful sorts—**MIGNONETTE**, clear pink, the finest bloomer of all, each 20 cts. **LITTLE WHITE PETS** Very large, pure white Elegant, 30 cts. each. **MAD'ELLE CECIL** FRUNER, salmon bush; splendid, 20 cts. **PAQUERETTE**, pure white. Very free bloomer, 20 cts. each—strong plants. One each of the 4 sorts for only 75 cents.

Our collection of **CHRYSANTHEMUMS** contains all the best varieties of both American and European introduction, and cannot be surpassed if equalled. We send, post paid, **OUR OWN COLLECTION of Chrysanthemums, 34 Choice sorts for only \$1.50.** In selecting this set it has been our object to offer a set of Chrysanthemums that would embrace the widest range of color, each sort being distinct and elegant, so that those who wish to grow but few kinds, might be able to purchase the choicest and most desirable varieties and be sure of getting something very fine and with a few get the most desirable. Full description of these together with the many other beautiful varieties in our collection in catalogue.

We wish we could convey in some small measure the extreme delicacy and richness of coloring of our **SET OF SUPERB NEW SINGLE DARLIAS**, a marked improvement to their popularity. We were awarded prizes for these by the New York Horticultural Society; 12 beautiful varieties—strong plants—for only \$1.50.

LILIA AURATUM. The Queen of Lilies. Our importation from Japan, of this the most beautiful of the Lily family, is unusually fine. Large healthy bulbs, 40 cts. each; 3 for \$1.00, 12 for \$3.00.

Do You Want a Garden of Rare Beauty?

All those who want the gayest garden with the least trouble and expense, should not fail to try our magnificent **Improved Double Garden Poppies.** They grow about 2 feet high, with magnificent large flowers, of the richest and most intense shades of color. They produce an effect that cannot be matched for brilliancy, perfect dazzling. This grand show which we offer has been produced after many years of high cultivation. For brilliant, dazzling colors these Poppies are equalled only by the Tulip—13 beautiful colors—White, White Striped, Red, White and Light Purple, Rose Light Red, Scarlets and White, Dark Scarlet and Violet, Lilac and Scarlet, Dark Modore, Gray, Cinnabar and Violet, Black Brown and Cinnabar, Fiery Scarlet. Seed of any color, per paper, 5 cts.—col edition, 13 papers in all for only 50 cts. Any of these articles sent post paid, on receipt of price. These together with many other attractions are freely described in our

\$400.00

Cash Premiums for 1885.

THE competition for the premiums offered last season by the BOWKER FERTILIZER COMPANY and ourselves for the largest yield of the celebrated PEARL OF SAVOY Potatoes from one bushel of seed, created a great deal of interest, and resulted in a widely diffused knowledge of the best methods of cultivation of the potato and the production of the following remarkable prize crops, viz:

- 1st. C. F. THOMPSON, Wadley's Falls, N. H., 178 bushels. 2d. ALFRED ROSE, Penn Yan, N. Y., 148 51-60 bushels. 3d. W. C. HILL, Glastonbury, Conn, 221 1/2 bushels. 4th. W. HRUSTIS, Belmont, Mass., 91 18-60 bushels. This has led us, in conjunction with the BOWKER FERTILIZER CO., to offer this year \$400 in Cash Premiums for the largest and best yield of the Pearl of Savoy Potato and the Angel of Midnight Field Corn grown on the STOCKBRIDGE MANURES. The "Angel of Midnight" is an Extra Early, eight-rowed Yellow Flint Corn, originated by us, and offered for the first time this year. Has ripened in 80 days and produced 160 bushels to the acre.

For full particulars see circulars, which we will mail free on application. If five cents is enclosed, to pay postage, will mail our beautifully illustrated Catalogue of 140 pages, containing several colored plates, the best methods of cultivation, and a complete list of

Vegetable, Field, and Flower Seeds, Implements, Machines, &c. JOSEPH BRECK & SONS, 51, 52 & 53 North Market St., BOSTON.

SEED Warranted to Grow.

or order rolled grain. I have sold vegetable and flower seed to over a million farmers and gardeners in the United States, perhaps some are your neighbors, if so ask them whether they are reliable. Mr. Thomas Houshall of Troy, Kansas, writes me: "For 20 years I have dealt with you. I have lived in Iowa, Missouri, Colorado, and Kansas, and no matter what the soil or climate, the result was always the same, to wit - religiously honest and good." This is the kind of seed I raise and sell. The Hubbard and Marblehead Squash, Marblehead Corn, Marblehead Cabbages, Ohio Potato, Early No. 1 Beet, are some of the vegetables of which I was the original introducer. A Fair with \$600 in premiums. See my catalogue, free to all. JAMES J. GREGORY, (Seed Grower), Marblehead, Mass.

AN EXACT LIKENESS, REDUCED IN SIZE, OF THE NEW POTATO,

BURPEE'S EMPIRE STATE.

THE BEST AND MOST PRODUCTIVE MAIN-CROP POTATO.

For natural-size illustration, full description and impartial trial reports, see pages 86, 87, 88 and 89 of **BURPEE'S FARM ANNUAL FOR 1885.**
It affords us much pleasure to introduce this new potato, as we are thoroughly persuaded that in it we have secured the best and most profitable main-crop potato ever produced. It originated with Mr. E. L. Coy, of Washington County, N. Y., whose life-long experience and skill give him the well-deserved position of the most successful originator of new potatoes—his success being judged, not by the number of varieties, but by their sterling merit.
BURPEE'S EMPIRE STATE is a strikingly beautiful potato. As shown in the illustration, it is somewhat more oblong than the *Beauty of Hebron*; the skin is white and smooth; eyes shallow, but strong, a single eye being fully sufficient for a hill. The flesh is pure, snowy white and floury; it is peculiarly rich and delicate in flavor, and cooks evenly throughout without any coarseness. It is decidedly the best white cooking potato. The vines are very compact and vigorous in growth; the roots are strong and extend very deeply into the soil, although the tubers lie very close to the surface. Its *hardiness* is most remarkable. Its strong and deeply penetrating roots enable it to stand severe drought exceedingly well. The originator has never seen a per acre, and tested alongside of all the most popular potatoes, it has in every case outyielded all others. The originator has ample foundation for the statement, "My lifelong endeavors to produce a perfect potato for general purposes have been fully realized. I have never seen any variety that combines so many highly desirable qualities."
BURPEE'S EMPIRE STATE POTATOES can only be procured direct from the introducers, **W. ATLEE BURPEE & CO., Philadelphia.**

AT AN ENORMOUS PRICE of **BURPEE'S EMPIRE STATE.** Doubtless the purchase of no stock potato ever cost so much money, and yet, by having it grown on an extensive scale, before introducing, we are enabled to offer it at what all will admit is a very moderate price:—

PECK \$1.50; PER BUSHEL \$5.00; PER BARREL \$10.00.
By mail 75 cts. per lb.; 3 lbs for \$2.00, postpaid.

Address all orders and enquiries to

W. ATLEE BURPEE & CO., Seedsmen, Philadelphia, Pa.

BURPEE'S FARM ANNUAL FOR 1885 will be mailed free to any address on application. It is a handy one book of 120 pages and tells all about the best Garden and Farm Seeds, including important novelties which can not be obtained elsewhere. **WRITE FOR IT!**

SUCCESS TO OUR NEW DEPARTURE IN THE SEED TRADE. Relief for the people!
Seeds at **AT WHOLESALE PRICES.** In order to introduce your door into 50,000 homes free of cost, we make the following unprecedented offers: **FOR 60 CTS.** in postage stamps or money, we will send by mail a box containing first, 17 packets, one each, of the following new, highly-improved, and guaranteed seeds:—**Dewey's Improved Blood Turnip Beet,** best and earliest for table use. **Wilson's Highly Improved Winningshead Cabbage,** best and earliest; good for late. **New Golden Heart Lettuce,** best for heading; good all summer. **Largest, finest, sweetest, best—Best in the world. Orange Cream Muskmelon,** sweet, spicy, and delicious. **New Silver Ball Italian Onion,** beautiful, large, mild; grows 8-10 pound onions **finest, largest, sweetest pepper ever seen. Ahoff's Sugar Parsnip,** greatly improved variety. **Ohio Sweet Potato Pumpkin,** enormously productive, excellent quality; keeps all winter. **French Breakfast Radish,** best of all early radishes. **White Pineapple Squash,** extra quality; good for summer or winter. **New Cardinal Tomato,** largest and smoothest of any. **White Munch Turnip,** best for table use. **SAMPLE PACKET OF GOLDEN BEAUTY CORN,** most beautiful and productive of any in the country. **THE STRAY BEAUTY, POTATO** ever yet seen; very productive, excellent quality, beautiful in oil painting.
17 packets of seed and 60 cts. TWO collections for \$1.10, FOUR for \$2.00. This is an offer never made before. To garden the heart and brighten the way of every lover of the beautiful has met with such unbounded success that we renew it with a more tempting offer, and here let us say we grow these seeds by the pound, by the bushel, and by the sack. **18 PACKETS CHOICEST FLOWER SEEDS FOR 80 CENTS,** one each, of **Asters, Balsams, Petunias, Portulacas, Phloxes, Pansies, Verbenas,**—all finest & rare and most beautiful colors. **Large Double English Holly-hock, New Dwarf Marigold, extra large double Zinnia,** bright colors. **One fine ornamental grass.** One splendid climbing plant. **One beautiful Evening Primrose.** **15 pkts for 50 cts. TWO collections for 80 cts.** Packets are regular size, with directions for cultivating. Our beautifully illustrated and descriptive Catalogue accompanies each order. Address all orders to **SEED SAMUEL WILSON, GROWER, MECHANICSVILLE, PENNSYLVANIA.** letters and money orders to

VICK'S FLORAL GUIDE

A beautiful work of 150 pages, Colored Plate, and 1000 illustrations, with descriptions of the best Flowers and Vegetables, prices of Seeds and Plants, and how to grow them. Printed in English and German. Price only 10 cents, which may be deducted from first order. It tells what you want for the Garden, and how to get it instead of running to the grocery at the last moment to buy whatever seeds are left over, meeting with disappointment after weeks of waiting.
BUY ONLY VICK'S SEEDS AT HEADQUARTERS.
MONTHLY MAGAZINE, Colored Plate in every issue, and many beautiful illustrations. Price, \$1.25 a year; Five copies for \$5.00. We will send to one address **Vick's** for \$1.00. Specimen numbers 10 cts; 3 trial copies 25 cts. Address all orders to one of the following publications at the prices named below—**railly two magazines at the price of one—Century, \$4.50; Harper's Monthly, \$4.00; St. Nicholas, \$3.50; Good Cheer, \$1.25; or Wide Awake, Good Cheer, and Vick's Magazine for \$3.00.**
JAMES VICK, Rochester, N. Y.

Our GREENHOUSE ESTABLISHMENT, begun in 1848, is now the largest in the country, covers an area of 4 acres solid in glass, and employs an average of 70 men throughout the year, therefore we can afford from the immense number sold to offer all the

Newest, Rarest and Finest PLANTS

At Much Lower Prices

Than the commonest kinds can be bought for. Any one of the collections named below sent **Free by Mail for \$1.00**, or when a number of collections are wanted by **CLUBS** or otherwise at the exceedingly **LOW RATES** on the terms below stated. Each collection (unless otherwise stated) contains all **DISTINCT VARIETIES** of the newest and best kinds of **OUR SELECTION**, each plant being labeled. No order is filled for less than one dollar, but we allow buyers to *have* collections if they desire it; for example, we will send 3 **Abutilons** and 2 **Azaleas** for \$1.00, but no further divisions of the collections will be made. Although it is a convenience to have plants sent by mail to places where there is no express office, yet in all cases where plants can be sent by express, we always advise them so sent; for not only are we enabled to sell much cheaper, but larger plants can be sent, and they invariably arrive in better condition. We therefore offer the below named collections to be sent by express, *buyer to pay charges* at the following exceedingly low rates: Three collections for \$2, five for \$3, nine for \$5, twelve for \$6, twenty-one for \$10, or forty-five for \$20, or the 84 collections (571 varieties of plants, bulbs and seeds—sufficient to stock a green-house or garden) for \$35, to which either of our books, "*Garden and Farm Topics*," or "*Gardening for Pleasure*," and Catalogue for 1885, (value \$1.75), will be added; in cases where any of the collections of plants or seeds are not wanted, we allow the purchaser to strike out and duplicate any other collection offered.

GEO. S. WALKER, Rochester, N. Y.

THE NEW WHITE GRAPE.

FRANCIS B. HAYES.

Hon. Marshall P. Wilder, Pres. American Pomological Society, says the

"HAYES"

Is the best White Child of the Concord, and one of the sweetest grapes he ever tested. It will, he says probably succeed almost everywhere.
The "Hayes" is out of the same lot of seedlings as the "Moore's Early." Send for catalogue.

JOHN B. MOORE & SON,
Concord, Mass.

The Marlboro Raspberry

With all the other varieties growing here, and with a knowledge of those catalogued throughout the world, we claim that the Marlboro has not an equal in desirable quality. We have invited all interested to come and see it, and neighbors and strangers without a single exception bear us out in the above statement. Interested parties and partisan journals may continue their misrepresentations. We say, come and see its earliness, its hardiness, its great growth of bush and unequalled size and perfection of all the berries. We also want you to eat it and try its solidity. Part of the crop was sent to Montreal, 450 miles by rail, in good order. First shipment brought 60 cents per quart, wholesale in New York, and ruled higher throughout the season than any other variety. Our new seedling grape, the

unequalled size and perfection of all the berries. We also want you to eat it and try its solidity. Part of the crop was sent to Montreal, 450 miles by rail, in good order. First shipment brought 60 cents per quart, wholesale in New York, and ruled higher throughout the season than any other variety. Our new seedling grape, the

ULSTER PROLIFIC,

In hardiness, mildew and rosbug proof and unequalled quality with its great bearing habits, much pleases the most difficult. The refinement of our seedling the

PO'KEEPSIE RED,

Its earliness, growth and productivity is already known to the country. The high quality of our white grape

Duchess,

Is so generally acknowledged that it no longer needs a description. Vineyardists are now planting it by the thousand. Send for circulars. Our recent hardy seedling, blackberry, the Minnewaski, is not yet catalogued or priced, but will be ready next fall.

A. J. CAYWOOD & SON, MARLBORO, N. Y.

Burpee's Dollar Collection

FOR THIRTY VARIETIES OF THE BEST VEGETABLES, 1885.

WHITE PINEAPPLE SQUASH.

10. White Pineapple Squash. A new summer and autumn variety of fine quality.
11. Burpee's Cardinal Tomato. Of a brilliant cardinal red, smooth as an apple, VERY SOLID, with no green core.
12. French Breakfast Radish. Very quick growing; white tail.
13. Red Top, White Globe Turnip. Of fine quality, early, and keeps well.
14. Burpee's Improved Long Orange Carrot. The best.
15. Long Smooth or Hollow Crown Parsnip.
16. Green Gem Bush Bean. Both pods and beans of a beautiful green and delicious flavor.
17. Stratagem Pea. One of the very best of the New Peas.
18. Amber Cream Sweet Corn. Medium early, handsome ears, very sweet and sugary.
19. Imperial Dwarf Large Ribbed Celery. The best dwarf white celery.
20. Long Smooth Blood Beet. Large, smooth roots, blood-red.
21. Filderkraut Cabbage. Heads round as marble, of large size and best quality.
22. Montreal Green Summer Melon. Of splendid flavor, and the largest of all musk melons.
23. Burpee's Silver Ball Lettuce. Beautiful silvery-white, rich and tender heads; very early but slow to run to seed.
24. Golden Globe Radish. Unsurpassed for summer use.
25. Essex Hybrid Tomato. Of large size, smooth, solid, purplish-red color.
26. Hubbard Squash. The well known standard winter squash.
27. Extra Early Purple Top Munich Turnip. Remarkably early.
28. Red Globe Onion. Large round onions; keep well.
29. Giant Yellow Rocca Onion. Of large size; mild and pleasant flavor.
30. Salsify. Well deserving a place in the garden.

BURPEE'S SILVER BALL LETTUCE.

All the above are full, regular-sized packets, with illustrations of the vegetables and concise directions for cultivation printed on each packet. The 30 varieties will make a complete vegetable garden for a small family. For One Dollar we will send the above splendid collection of new and choice vegetable seeds, postpaid to any address, or 3 complete collections, ordered at one time, for \$2.50. This is the most liberal offer ever made. Order Early! and please show your collection to your friends, as they will then want to order. Can you get up a club of three for \$2.50, or six for \$5.00? For 50 Cents we will send the first 15 varieties (Nos. 1 to 15, inclusive), post-paid, to any address. For the 50 cts. collections for \$2.50. Either the 50 cts. or the \$1.00 collection would make an acceptable present to a distant friend, and would help introduce the new, improved varieties embraced in these assortments. As we sell none but genuine and unadulterated seeds, and the above very liberal offers can only be afforded by special previous arrangements on our part, we would respectfully intimate that we can make alterations or substitutions.

FLOWER SEEDS. Our Flower Seeds are equal as fine in quality as our Vegetable Seeds, and to introduce these also to new customers, we have prepared a special offer for 1885, known as Burpee's Gem Collection. This collection embraces 10 packets of the most popular varieties of Annuals, including Asters, Balsams, Mignonette, Pansy, Petunia Hybrida, Phlox Drummondii, Verbena Hybrida, Double Zinnia, Sweet Peas, etc. The entire collection of 10 Varieties is sent for 25 cents, postpaid to any address. **BURPEE'S FARM ANNUAL** for 1885, will be sent free to any reader of the American Garden, who orders above seeds or writes for a copy. It is a handsome book of 120 pages, with hundreds of illustrations and two colored plates of important Novelties of rare merit. The best Seeds at the lowest prices for Market Gardeners and private planters.

J. T. LOVETT, Little Silver, New Jersey.

WHITE

THE NIAGARA WHITE GRAPE COMPANY, having decided to offer for sale to the general public, without restriction, a limited number of two-year-old vines of their CELEBRATED WHITE GREAT NIAGARA, orders will now be received and entered in rotation for vines to be delivered in the spring of 1885, until their stock of vines is exhausted. The merited popularity of this wonderful Grape among fruit lovers throughout the country, has induced unscrupulous persons to attempt a FRAUD in offering to us that they are genuine Niagaras. This Company furnish them to their customers at a reduced price, claiming that they are genuine Niagaras. The absolute control and desires, therefore, to inform the public, that it now has, and always has had, the absolute control and possession of all the vines grown from the wood or cuttings of the Niagara up to this time. Only persons having a certificate of authority from the Company, under the Company's SEAL, will have the right to take orders for or to sell the vines of the NIAGARA, and that every vine furnished by the Company, is directly or through their authorized agents, will have securely attached to it a SEAL, plainly stamped with direct or through their authorized agents, reliable dealers and nurserymen will be supplied upon liberal terms, and furnished with authority to take orders, making satisfactory arrangements with the Company. Local agents wanted in every town throughout the United States and Canada, to sell our Niagara Vines from sample grapes. Circulars and Colored Plates are also furnished by the Company. Address, LOCKPORT, N. Y.

A PRONOUNCED SUCCESS

Thousands of Acres Plowed with the Flying Dutchman, and Every Claim Made for This Wonderful Plow Fully Substantiated.

Why is this plow so successful and popular?

Because it runs **ONE HORSE LIGHTER** than any other plow made.

Because the plow is **CARRIED, GAUGED AND GUIDED** by the use of three wheels.

Because the plow is **IN FRONT** of the driver.

Because the weight of the driver is **OVER THE FURROW WHEEL**, adding but little to the draft, but keeping the plow down to its work.

Because the swivel plate pole **PREVENTS ALL SIDE DRAFT** or weight on horse's necks.

Because it is simple, strong and durable, and does first-class work.

Illustrated circulars (descriptive), The Story of the Flying Dutchman (sensational), The Agricultural Pilgrim's Progress, with six tinted illustrations (comic), all sent free to any address.

THE "PLANET JR" HOLLOW STEEL STANDARD HORSE HOE.

NEW
As lately introduced, has no equal in the world. Its excellent work in the field has distanced that of all competitors. It is, in some sections, doing in one passage, the work of four or five old-style implements, and in others superseding the customary expensive two-horse tools. The "PLANET JR" HAND SEED-DRILLS AND WHEEL HOES are the newest and best, lightest and strongest known. There are 7 distinct tools, each with special merits, no two alike or the same price; all practical and labor-saving. Let no Farmer or Gardener fail to study up during the winter months, and exact engravings of these different machines, and such descriptions as will enable the reader to judge correctly of their merits. Thirty pages and Forty engravings. Free to all. Correspondence solicited.

S. L. ALLEN & CO., MANUFACTURERS, 127 and 129 CATHARINE ST., PHILADELPHIA, PA.

"ACME" PULVERIZING HARROW, Clod Crusher, and Leveler.

AGENTS WANTED.
It is the best selling tool on earth.

The "ACME" subjects the soil to the action of a **Steel Crusher and Leveler**, and to the **Cutting, Lifting, Turning** process of **DOUBLE GANGS of CAST STEEL COULTERS**, the peculiar shape and arrangement of which give **immense cutting power**. Thus the three operations of **crushing lumps, leveling** of the ground and thoroughly **pulverizing** the soil are **performed at the same time**. The entire absence of **Spikes or Spring Teeth** avoids pulling up rubbish. It is **especially adapted** to inverted sod and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that **cuts over the entire surface** of the ground.

Variety of Sizes, 4 to 15 feet wide. — We deliver free at our distributing depots.

DO NOT BE DECEIVED. Don't let dealers palm off a base imitation or some inferior tool under the assurance that it is better, but **SATISFY YOURSELF by ORDERING AN "ACME" ON TRIAL.** We will send a Double Gang Acme to any responsible farmer in the United States, and if it does not suit, he may send it back, we paying return freight. We don't ask pay until tried on his own farm.

Send for Pamphlet containing Thousands of Testimonials from Forty-eight different States and Territories.

Bradley's Superphosphate.

Uniform in Quality. Uniform in Condition. Uniform in Value.

STANDARD GUARANTEED.

Unequalled Mechanical Condition.

A Complete Manure for All Crops.

Highest Grade Materials Used.

For nearly a quarter of a century, Bradley's Superphosphate has maintained its reputation as the best in the market. Based upon no vague, theoretical principles, it is not an experimental fertilizer, of variable composition and fluctuating value but a thoroughly practical and reliable manure, of uniform quality, condition and value. It contains all the elements of plant food in the most nutritious forms, derived from the best materials and combined in proportions proven by an actual experience of 24 years to best constitute

A WELL-BALANCED COMPLETE MANURE,

For general use on all crops, either with or without barnyard manure.

Pamphlets mailed free to any address.

REDUCED PRICES. THE MAPES COMPLETE MANURES

For the Farm or Garden.

All in **FINE DRY** condition. May be readily sown by hand. Each bag **PLAINLY BRANDED** and a tag attached giving full directions for use. If used in connection with Stable Manure, the quantities recommended may be reduced. May be applied broadcast or scattered in the rows before planting, and also at any hoeing or cultivation.

	Prices on Cars or Boat.		Prices on Cars or Boat.	
	Per ton	Per bag 2,000 lbs. 200 lbs.	Per ton	Per bag 2,000 lbs. 200 lbs.
For Potatoes —Use the Mapes Potato Manure—3 to 10 bags per acre. The largest yields of potatoes on record were grown by E. S. Curman, Editor RURAL NEW YORKER, with this Manure. Durling past year Dr. W. S. Combs, Freehold, N. J., grew on nine acres 525 bushels and on 14 acres, 4,480 bushels. No rot; quality very superior. This manure is also specially recommended for Asparagus, Beets, Mangolds, Early Turnips, and may be used on all early truck and vegetables. It is not quite so forcing as the next following manure.		\$48.00	\$1.80	
For Vegetables —Onions, Tomatoes, Cucumbers, Melons, and all truck. Use the Mapes Complete Manure (for general use.) Four to ten bags per acre, broadcast, raking or harrowing in. Theo. F. Baker, Camden, N. J., President N. J. Horticultural Society, and one of the largest and most successful truckers, reported 2,700 bushels onion sets on 12 ac. s. He claims a saving of \$20 per acre from combination of fertilizer with stable manure over stable manure alone, and superior results, earlier and better quality; also larger yield from fertilizer alone than from stable manure alone.	50.00	5.00		
For Fruits —Strawberries, Raspberries, Grape Vines and all Fruit Trees, use in early Spring the Mapes Fruit and Vine Manure. One hundred pounds to 2,000 square feet—work in around trees at far as the branches or roots extend. This manure is for increasing the fruiting power of trees and	40.00	4.00		
vines. If a fertilizer is desired for making more rapid wood growth, the Pointo Manure may be used in the same way as the Fruit and Vine Manure.				
For Cabbage and Cauliflowers —Use the Mapes Cabbage and Cauliflower Manure—five to 10 bags per acre. This manure is used largely, and to the exclusion of stable manure, by many of the cauliflower growers at Mattituck, L. I., and by cabbage growers at east end of Long Island and elsewhere.			45.00	4.50
For Tobacco —Use the Mapes Tobacco Manure—eight to 10 bags per acre.			50.00	5.00
For Sweet Corn . Field Corn, and Corn Fodder, use the Mapes Corn Manure—three to four bags per acre.			46.00	4.60
For Turnips (late)—Use the Mapes "A" Brand Manure. This is also an excellent fertilizer for using in the hills or rows for all crops—it is very safe.			10.00	4.00
For Grass Top-Dressing —Pastures and Lawns—Use the Mapes Grass and Grain Spring Top-Dressing—one to three bags per acre. This is much superior to stable manure for spring application, particularly around dwellings, croquet-grounds, and lawns.			47.00	4.70
The Mapes Pure Ground Bone :				
"Meal and extra fine".....			36.00	3.60
"Fine".....			35.00	3.50
"Medium"—very lasting.....			34.00	3.40

These Manures permanently improve the land by adding to its stock of plant food, the same as stable manure. The decaying roots of most of the crops keep up sufficient supply of vegetable matter in the soil. Seven successive crops have been grown from a single application to a potato crop on poor land, and all the crops showed large increase over natural soil.

Freights.—By reason of present competition between the leading transportation lines, we can often ship at very favorable rates, particularly in car-load lots. Those ordering from us, even by the single bag, may rely upon our securing the lowest rate possible. Send postal for pamphlet on manures for all crops.

Penguin Island Guano
A pure natural guano, containing over 45 per cent of bone phosphate of lime and 1.25 per cent of ammonia, a fertilizer for all farm crops. Price \$25 per ton delivered on board railroad or steamboat in New York, also at lowest market price. Sulphate of Ammonia, Germano. Sulphate of Potash, and all fertilizing chemicals. Send for circular to CHAS. SPEAR, Jr., 85 West St., N. Y.

A SUGGESTION TO GARDENERS.

MARKET gardeners on Long Island now rely almost wholly upon fertilizers. It is said that over 5,000 tons are used in this small territory annually. Why? First,—Because they are cheaper than manure, although the Long Island farmers are so near New York City that stable manure can be brought to them in boat-loads at a very low price. Secondly,—Fertilizers are more cheaply applied, and produce as large crops of fully as good quality. It seems to us that market gardeners would do well to buy manure only for its mechanical action on the soil and for bottom heat. There are many market gardeners in the vicinity of Boston that are, as the Germans say, "manure sick." That is to say, they are in that condition in which there is not a sufficient supply of mineral elements to produce a paying crop. To such lands, mineral fertilizers or chemicals should be applied for they correct this condition. Let all market gardeners, therefore, who have not done so try fertilizers on such lands. In other words, buy fertilizers, which are concentrated plant food, for the same reason that grain, which is concentrated animal food, is bought for farm stock. Let the manure hold the same relation in the feeding of the soil, that the hay does in the feeding of stock. Hay is bulky animal food, while grain is concentrated animal food. Manure is bulky plant food, while chemical fertilizers are concentrated plant food. In each case they are best used together.

Reports on Strawberries, Fruits, Etc., with Stockbridge Manure.

Kennebec Co., Mo. CHAS. C. ATKINS.—I planted several hundred young apple trees on worn-out land, in May, 1881, making no preparation but the spading up of the places in the turf, and no manuring except three cents worth of Stockbridge Fruit Tree Fertilizer per tree. All lived, and made excellent growth,—from 10 to 30 inches on each twig. I shall use more.

Hillsboro' Co., N. H.—G. & H. WHITTAKER.—We have used the Stockbridge Manures on Grass, Peach trees, and Grape vines, with good success the past season.

Barnstable Co., Mass., J. S. DILLINGHAM.—I have used your Corn Fertilizer, also Potato and Bean, and am well satisfied with the result. I have also used your Cranberry Dressing, for about 3 seasons, and have supplied my neighbors with it. We think it is valuable to make the vines grow and thicken. It helps the fruit and kills the moss.

Bristol Co., Mass., W. O. SWEET.—Having noticed in your pamphlet that Strawberries grown on Stockbridge would stand up better and produce finer berries than when grown on stable manure, I determined to experiment with it, and am well satisfied with the results. In 1879, I raised a good crop of Potatoes of superior quality, using nothing but your Stockbridge Potato Fertilizer. In the spring of 1880, I planted this piece of land—1/4 acre—to Strawberries. After well pulverizing the soil with a La Dow harrow, the plants were set out in April, and the first bag of Stockbridge applied in July following, then another bag in September, and the rest in April, 1881, making 600 lbs. in all. The variety of Strawberry is the Charles Downing. When the fruiting season came, the fruit stems were strong and well loaded with large, firm berries; and the berries were the same firm first to last picking, presenting a fine appearance in market, and bringing a better price than the same variety grown on other fertilizer.

Middlesex Co., Mass., H. H. BOARDMAN.—I have used your Stockbridge Fertilizer on Strawberries the past season, with satisfactory results. It is better for that purpose than any manure I know of. Your formula for the garden crops pleases me equally well.

Windham Co., Vt., N. MONROE.—Applied 4 bags of your Stockbridge Fertilizer on my Strawberry patch, and the vines look better than when I applied a larger amount of stable manure.

A FAMOUS ORCHID HOUSE.

A FAMOUS ORCHID HOUSE.

Orchid culture is so rapidly increasing among us, and information about the "Royal Family of Flowers" so much sought after, that we present an interior view of one of the most celebrated Orchid houses in England, that of William Saunders, at Hillfield.

Ornamental arrangement and picturesque effects are natural to Orchid culture. The introduction of a few Tree Ferns and other tropical ornamental foliage plants through the centre of the house lends grace and va-

riety to the general character, while the green foliage heightens the effect and brilliancy of the Orchid flowers.

All through the house, above, below, along the side, everywhere it literally swarms with Orchids, and to make room for the greatest possible number, the ingenious device is adopted of erecting curved or bowed wire trellises along the sides of the house near the glass. On these the smaller kinds cluster and thrive in luxuriant health, giving a fairy-like appearance to the whole.

Such a house may be made highly attractive and picturesque the year round. The baskets for the parasitic forms may be made in rustic work, in keeping with the plants growing in them, and the terrestrial species may occupy the ground and benches.

The increasing demand for Orchids has produced a more than corresponding supply. Now a dozen choice kinds can be bought at what a few years ago would have been thought low for a single plant. They will flourish in a Wardian case.

The Vegetable Garden.

SEASONABLE HINTS.

In the choice of topics discussed in this column we are naturally guided to some extent by the purport and number of inquiries received from our readers. Information about hot-beds seems to be predominantly sought for lately, and every person living in the country ought to know how to make a hot-bed. If we had our way about it we would teach it in every public school, and the fundamental horticultural and agricultural principles as well. Such instruction, if not more than an hour a week, would exert a powerful and beneficial educational influence, and add untold riches to the wealth of our people.

Hot-beds for forcing very early vegetables require considerable care in their management, but for ordinary garden purposes, little labor and expense is necessary. Procure fresh horse-manure, throw it in a loose heap till it heats, then turn it over, shaking it up loosely and mixing it well; leave it in this heap till it heats again, which will be in a day or two, when it is ready for use. Fill your frame with it to within eight or ten inches of the surface, pack firmly and put on your sashes. Now let it alone for a few days till it heats again and the greatest heat is past, then put in four to six inches of soil, if the seed is to be sown directly in the bed. Many prefer to sow in boxes and flats, in which case little or no soil is required. Seed should not be sown before the surface heat has declined to 100° or less. After that it will quickly cool off a few degrees more.

In using hot-beds be very careful for the first week to allow the escape of steam, and to do this you will have to ventilate at night as well as by day. In cold weather cover them up well at night. In watering plants in hot-beds do not drench the soil or pour on more water than is required, else you will cool the bed too quickly, and destroy the very end you should try to maintain.

Early Peas, earlier than one's neighbors, is the great aim of the ambitious amateur gardener. To succeed in this a warm, dry, sheltered situation is of first importance. But even under such favorable conditions, a week may be gained by sprouting the seed in the house in a box filled with moist sand, and kept in a warm place. After the young shoots and roots have appeared plant the Peas carefully in previously prepared ground. American Wonder may be grown very satisfactorily in a cold-frame.

Asparagus should be planted as soon as the ground becomes sufficiently dry to be worked. The antiquated methods of digging trenches and laying foundations of stones and old tin cans, practiced in the dark ages, have held on with remarkable tenacity, but are being rapidly superseded by those more in conformity with the nature of the plant. Rich, dry soil, and plenty of room are the main requisites for successful Asparagus culture, everything else is of secondary importance. Good one-year old roots are better than poor two-year old ones, or such as have been growing too thickly in the seed-bed. When planted, the crowns should be six inches below the surface.

SELECTING POTATOES FOR SEED.

Potato sets as used for planting correspond in their structural character with grafts of trees, and, in the case of single eye sets, with buds. They are not seeds proper, and it has therefore been supposed by many that improvement in Potatoes could be accomplished only by raising new varieties from seed. Some careful and ingenious experiments by Dr. E. L. Sturtevant, director of the N. Y. Experiment Station, throw a good deal of light on this question and are worthy of careful consideration. In the fall of 1883, says the Doctor, we selected and laid aside for seed the largest and the smallest tubers from the most productive, and the least productive hill of ten varieties growing in the Station garden.

On the 8th of May, 1884, this seed was cut into single eyes and planted, each selection by itself in the garden. So that we had four short rows of each of ten varieties, the first row containing the cuttings of the largest tuber from the most productive hill, the second those of the smallest tuber from the most productive hill, the third row the cuttings of the largest tuber from the least productive hill, the fourth those of the smallest tuber from the least productive hill.

The cultivation was alike and the treatment was alike during the whole period of growth, and when the tops were dead the rows were dug, and yield of marketable and unmarketable Potatoes carefully noted.

In order to bring the results into comparison we calculated the yields obtained to the 100 eyes, and arranged the varieties in the order of merchantable yield.

These tables furnish an important clue for progress in the improvement of the Potato. They seem to indicate very clearly that in order to increase our yield of Potatoes, it is only necessary in digging our crop to expose the hills separately, and then before harvesting go through and select our seed Potatoes from those hills which show the most abundant crop.

The experiment also seems to indicate that deterioration in a variety, whereby a good variety tends to become less and less profitable to grow, arises from the entire lack of selection from the point of view of the prolific plant, and that to obviate this deterioration it may only be necessary to yearly select our seed from the more prolific hills, instead of hap-hazard from the harvested crop. The importance of this experiment perhaps justifies the massing of our conclusions in the following table:

	Lbs. per 100 hills Average.	
	Marketable.	Total.
From largest tubers from most prolific hill	83	106
From largest tubers from least prolific hill	67	85
From smallest tubers from most prolific hill	69	88
From smallest tubers from least prolific hill	45	69

From this table it appears first, that the merchantable and the total yield from the seed taken from the most prolific hill, yielded in excess over the seed taken from the least prolific hill; second, that the yield of the largest tuber from the most prolific hill exceeded the yield of the largest tuber from the least prolific hill; third, that the yield of the smallest tuber from the most

prolific hill exceeded the yield of the smallest tuber taken from the least prolific hill; fourth, that the smallest tuber taken from the most prolific hill exceeded in yield the largest tuber taken from the least prolific hill; fifth, that the largest tubers from the most prolific and the least prolific hills yielded more crop than did the smallest tubers from the same hills.

The question may arise whether the smaller size of the cuttings from the smallest tubers may not account for the difference in yield. The smallest tubers from the most productive hills, however, did not exceed in size the smallest tubers taken from the least productive hills, and hence our results must be interpreted that the tubers from the most productive hills possess more inherent vigor than do those of the least productive hills.

While we cannot regard a single experiment as in any sense conclusive, says Dr. Sturtevant, yet the evidence seems so clearly in favor of using for seed only tubers from the more productive hills of Potatoes, that we think we cannot err in commending this subject to the careful consideration of Potato growers, and we would be very glad, this coming season, to have those who are interested in the subject make a trial according to this method, and experiment for themselves, and report the results, however they may result, to the public.

EXPERIENCES WITH PEAS.

An experience of many years in Pea-growing leads me to the conclusion that the same varieties may vary so much in different years as to give the impression that they were different kinds. The American Wonder, for instance, did splendidly with me when raised from headquarter seed, but when I planted the seed I had raised myself, from this stock, the crop was as early but very unsatisfactory as to quantity, while the quality was excellent. I never succeeded in producing single vines that would have more than a dozen pods; but the pods were large and full, and the Peas very sweet and fine-flavored. For the home garden they are excellent, they require no brush and can be planted in rows one foot apart, or as near as Bush Beans.

In raising Peas for market I have looked for quantity as well as quality. So my choice has fallen on some of the smooth white Peas like Carter's First Crop, or Philadelphia Early for first, McLean's Advance for second, and Black-Eyed Marrowfat for late. The Eugenie and Champion of England are good second early Peas. Dealers have a habit of mixing their own name to some early Pea; which makes about as many kinds as there are seed dealers.

Conditions of soil, vitality of the seed, time of planting, will make a difference in time of ripening in seeds from the same stock. Early Peas are thus much like the scholars in the old-fashioned spelling class; they have burns of going to the head. A uniform condition of earliness and yield, is the great consideration in a market Pea.

Some kinds should be planted thick and others thin. I had an illustration of this last year with Carter's First Crop Peas that were in bloom and had pods well set with Peas when the frost of May 30th occurred. The

frost stopped the growth of the vines at that point and a few of the pods matured. The Peas should have been ready to pick June 15th. After the frost the vines threw up two to six new shoots from each stalk, and by July 11th the last of the Peas from that growth were picked. The Peas had sprouted from the root, blossomed and borne in forty-one days. Moreover, I had a crop corresponding to the increase in vine, thirteen bushels from twelve square rods of vine, which goes to prove that some Peas may be planted very thick.

My practice is to manure heavily for Peas, while many of my neighbors plant after some well-manured crop of the previous year, and without manuring the same year. I never brush Peas, not even the high-growing sorts; they are picked twice, and then the vines are cleared off and the land plowed for a second crop; Sweet-Corn, Cabbage, late Beans, Pickles or Turnips.

I have found the Champion of England to boil hard, instead of tender, after it had passed a certain stage, a feature which I have not noticed in any other variety. For that reason I do not raise it.

I have given up raising my own seed as I can buy as good, or better, and as cheap as I can raise it, and what I can buy is not generally affected by the weevil.

My idea of a good market Pea would be one that had a nice clump of pods all ripening so near together that they could be picked all at one picking, while none would be too hard nor yet too green.

W. H. BULL.

EARLY SWEET CORN.

Gain in earliness in Sweet Corn has, as a rule, been accompanied by a corresponding diminution of size. With but very few exceptions all the extra early varieties we have grown were so small and imperfect as not to be worthy of cultivation.

The Early Bonanza Sweet Corn, now being introduced by Johnson & Stokes of Philadelphia, is claimed to be free from this objection, and to be larger than any of the older early varieties, and as early as the earliest. Our illustration, which was drawn from nature, shows its general appearance and prolific tendency.

It originated with a market gardener near Philadelphia who had for a few years astonished his brother-gardeners by having in market some weeks ahead of them five ears of Sweet Corn in great abundance. Its table qualities are said to be unexcelled in sweetness and rich flavor. We consider it well worthy of trial, and shall give it liberal space in our own experiment garden.

RAISING VEGETABLE PLANTS.

While it is a comparatively easy matter to raise vegetable plants for the family garden or the truck patch, to insure best results more care has to be bestowed upon them than is usually given. Often times the plants have a good seed bed and obtain a firm start, but are allowed to stand too thick and thus become spindling and almost worthless.

Young plants, to be able to withstand the attacks of insects, and of drouth and other adversities of weather, need to be as strong and vigorous as possible. To produce this

result they should be transplanted often and carefully, which is especially necessary with Tomatoes, Peppers, and other tender plants requiring delicate treatment. A single Tomato plant which has been cared for properly before the final transplanting, and has developed a good strong growth, with a stout, stocky stem and plenty of fibrous roots, is worth five times as much as the spindling affairs that are often offered as apologies for plants.

Small flower-pots, boxes, or even tin cans may be used where only a limited quantity are grown, but on a large scale this is of course not practicable. My experience in this direction has been largely with hot-beds and cold-frames, the plan followed being to transplant from one bed to another once to three times before the final setting in the open ground. The distance apart in the beds varies somewhat according to the avail-

THE EARLY BONANZA SWEET CORN.

able space and the size of the plants, as they may be placed quite closely when necessary, but of course the roots cannot be preserved so carefully in taking up when the plants stand very close together. When these preliminary transplantings are impracticable, and one is obliged to transfer the plants directly from the seed-bed to the open ground, much may be gained by proper care in planting.

Last season, with the assistance of my "right hand man," I set out several thousand choice seedling Potato plants,—during a very hot and dry spell in June. Owing to lack of space in the beds they had not been transplanted previously, and consequently had grown rather spindling. The seedlings were planted in long rows, quite close together. A drill of the proper depth being opened, and after clipping off the larger leaves to prevent too rapid evaporation, the plants were planted in the furrows with just enough earth drawn in to support them

in an upright position. The drill was then sprinkled and completely soaked with water, and afterwards filled with earth which was thoroughly pressed down with the feet, the dry soil thus forming a mulch and checking evaporation.

This was done during the two hottest days in June, which were followed by nearly two weeks of dry, hot weather, yet I did not lose five per cent. of the plants, while had they been planted in slipshod manner, probably not five per cent. would have lived. Therefore it is well to remember that if a plant is worth planting at all, it pays to plant it well.

W. H. RAND.

GROWING ONIONS.

With no other crop is thorough preparation of the land of more importance than with Onions, and when to this are added careful cultivation and skillful management, Onions can be made one of the most profitable products of the garden or farm.

It is a peculiarity of this crop that it may be grown repeatedly upon the same soil, and thrives best upon the rich vegetable black mold of reclaimed swamps. For such a crop, plowing is not required; the surface only needs working to a depth of four or five inches, and on the rich mellow Onion land this is most perfectly done by the "Acme" Pulverizing Harrow, Clod-Crusher and Leveler, by which the soil is turned over equally as well as by a plow, and mixed and worked together so as to distribute fine manure and fertilizers perfectly through it, better than it can be done by a plow, and at one-tenth of the expense, and in one-tenth of the time. Where several acres of Onions are grown this implement is indispensable, as indeed it is for every farm or garden crop grown.

MIDDLETOWN.

[The merits of the Acme Harrow are not in the least over-rated in the above, as we know from personal experience. For thorough mixing and mellowing of the soil preparatory to sowing seed or planting fruit and vegetable plants it is far ahead of all other implements made for the purpose.—Ed.]

THE MELON SHRUB.

Melons growing on shrubs are the latest vegetable wonder reported from California. The shrub is said to have been introduced from South America, and although its botanical name is not given we surmise that it is not a Melon proper but one of the many species of *Solanum* that bear edible fruits, similar to the Egg-plant.

Solanum Quitoense is a shrubby plant with berry-like fruits resembling small Oranges in size, color and taste, and of peculiar fragrance.

S. muricatum, the Pepino of Peru, is a shrubby species with egg-shaped, edible fruits, which are white with purple spots, and attain a length of six inches.

NEW REMEDY FOR CABBAGE WORMS.

The latest remedy recommended consists simply of ice-cold water, or water but a few degrees warmer than ice-water, sprinkled upon the worms during the heat of the day. An application in the hot sun is said to cause them to quickly let go their hold upon the leaves, curl up, roll to the ground, and die, while the Cabbages suffer nothing, but look all the fresher for the application.

HOT-BEDS.

It is a common, but mistaken notion, that hot-beds derive, or at least should derive, a considerable portion of their heat from the sun. Probably more than half of those who construct hot-beds believe that the glass is used to admit the warmth of the sun. The truth of the matter is that the office of the glass is to admit light, and not warmth, and the warmth derived from the sun frequently does more harm than good.

The chief source of heat is the manure used in the foundation of the bed. Its fermentation can alone produce sufficient heat to germinate the seeds and keep the plants growing, and it is sufficient for this; while the heat derived from the sun, being confined to the middle of the day, and totally lacking at night, destroys the equability of temperature essential to the best results, and which can easily be had when only the manure is depended upon for heat.

As the heat of the sun is not essential, and as the chances are that it is on the whole injurious, the hot-bed is best built in some situation shaded from the direct rays of the sun. However, it should not be in an exposed situation, for that is only increasing the difficulties to be overcome by the fermentation of the manure. I would advise that it be situated on a southern slope, or better, in the lee of buildings. A splendid place is in the area protected by a straw stack built in the shape of an L.

To the growth of the plant, not to the germination of the seeds, however, light is absolutely essential. Hence, while the heat of the sun is cut off, the light must be freely admitted. This is why the covering is properly of glass or some other transparent or translucent substance—to admit light. By building a high shelter over the bed the heat of the sun is intercepted, but not the light; and a hot-bed so sheltered will give the best results.

It follows, then, that glass is not essential; any substance which will freely admit the light will answer; and where the hot-bed is not shaded from the sun, there are other materials better for the top than is glass. Such a material is white cotton cloth of a close texture, treated as follows: Stretch it and nail it on the frame. Then mix 2 ounces of lime-water, 4 ounces of linseed oil, 1 ounce of white of eggs, separately; 2 ounces of yolk of eggs; mix the lime and oil with a very gentle heat; beat the eggs separately, and mix with the former. With this mixture coat the cloth, using a paint brush; continue coating till the cloth becomes waterproof, allowing each coat to dry before another is applied. This cloth costs only about one-fourth as much as the same area of glass, and repairs are correspondingly cheaper and much more easily made. A further advantage is that while the cloth admits the light freely it excludes the heat of the sun from the hot bed.

The heat all comes from below, and the temperature of the bed is equable; and no matter how warm the sun, the bed does not require watering, and the plants are never struck down or checked in their growth. The plants also grow more stocky and hardy. As the reader knows, the great trouble with hot-bed grown plants is that they grow spindling and weak. This is be-

cause of the heat from the sun. Naturally the plants grow toward the heat; but when it is shut off, the plants keep nearer the heat from below, and the result is a stronger root formation, with a shorter, stockier stem. As the vapor arising from the manure is condensed by the cool air passing under the cloth, it hangs in drops inside, keeping the air warm and moist, the conditions most favorable to plant growth. Plants grown under the cloth do not require such delicate attention while hardening for transplanting as those grown under glass.

From what I have written, it is apparent that the object in making the north or west side of the frame the highest, is to ward off winds and not secure the more direct penetration of the rays of the sun. When the bed is otherwise protected from cold winds, the frame can be made level, and this greatly simplifies its construction.

JOHN M. STALL.

EARLY POTATOES IN NEW ENGLAND.

For a readily salable market crop, early Potatoes are highly prized with us. Early Ohio and Beauty of Hebron reach a marketable size quicker than any other variety we have tried, if planted on high, dry land where they are not liable to be injured by spring frosts.

About the 1st of April we prepare the seed-pieces, using sound, marketable tubers. Ordinary-sized ones we use whole, very large ones we cut once or twice, leaving two strong eyes to a piece and cutting out the rest. After cutting we place in barrels or boxes and put in the cellar again for ten days or a fortnight until ready to plant. The pieces dry off and harden but do not shrivel. Seed treated in this way makes a strong start and an even stand, and the crop ripens evenly.

As early as the ground can be worked we manure, plow and harrow thoroughly. Furrow out the rows three and a half feet apart, make a loose, wide furrow five inches deep, drop the seed-pieces eighteen inches apart, and just cover as lightly as possible with earth. This can be done quickly with the foot when dropping the seed. Then scatter special fertilizer or super-phosphate of lime along the row over the seed and cover all about two inches deep, thus leaving the top of the drill an inch or two below the surface of the ground.

Planted in this way you can work the crop the first time to advantage with the smoothing harrow. Cultivate shallow and often and finish with the hoe, drawing the earth around the plants, smothering any weeds and leaving the ground level. Poison the bugs, and as soon as the tubers are of marketable size dig them with a five-tined garden fork.

E. A. JAMES.

MANAGEMENT OF SANDY SOILS.

While sandy soils are generally better adapted to gardening and the raising of root crops especially, yet in a season of drought they dry out much more rapidly than heavier lands. A naturally light soil with a good proportion of sand will produce better roots than any other, provided it is rich enough to induce quick growth. For this reason well rotted manure should be liberally applied, and by this plan soil that otherwise would

not give a paying crop can easily be made profitable by proper management.

Rotted bagasse thoroughly incorporated in the soil will do much towards retaining moisture in light, sandy soil that will dry out rapidly. And if the soil is naturally rich, a liberal application of this material is generally all that is necessary to supply the required plant-food. I have found that on sandy soil it always pays to use only well-rotted manure. The special advantage for garden work of a light, loamy, sandy soil in working, is not only in preparing the land for seeding but also in cultivating and keeping it mellow. Coarse, raw manure destroys to a considerable extent this most valuable property, while in applying a fertilizer, it should be done in such a way as to increase rather than diminish the advantages such a soil possesses. If care is taken to fine the manure well before applying, the work of incorporating it into the soil is comparatively easy of accomplishment.

If fertility alone were needed, the very best plan would be to apply liquid manure, but if a material to retain moisture is also required, well-rotted stable manure is much better. Where bagasse can be procured in sufficient quantities to be used for bedding cattle, it furnishes the very best material for a compost intended to enrich a light, sandy soil and at the same time to retain its moisture.

N. J. SHERNERD.

FRESH SPROUTS.

Successful gardening is a continuous warfare with bugs and beetles, borers and grubs, worms and maggots.

How much manure can be used with profit in the garden, is the leading question with the market gardener, not how little he may get along with.

A Virginia farmer recommends to provide Sweet Potatoes with brush or some other support to climb upon, and thus prevent the vines from taking root.

It is estimated that a quarter of a million acres of Sunflowers are grown in Russia. The oil expressed from the seed is used mainly for industrial purposes.

The object of experiment is primarily to establish facts, and secondarily to draw proper deductions from these facts in their various relations, says Dr. Starrevant.

Asparagus requires a good deal of potash. Capt. John Moore has a bed of an acre and a half, on poor soil, which has never had a shovelful of manure, but has been dressed with phosphate of lime and potash, and is growing nicely.

Splach, unless sown very early in spring, is apt to go to seed before it is fit for use. The Round-leaved is better than Savoy-leaved, and Long-standing is the best of all for spring sowing.

The *American Grocer* estimates that during the past season there were put up 2,021,177 cases (or 48,508,248 cans) of Tomatoes, being about one-third less than the pack of 1883, the decrease in acreage being heaviest in the Eastern States.

The Fruit Garden.

SEASONABLE HINTS.

As soon as the frost leaves the ground, and the soil becomes dry and friable, is the best time for planting fruit-trees, Grapevines, and berry plants of all kinds. Those starting into growth earliest should, naturally, be planted first, and, with proper preparation, tree planting may be finished before other garden work becomes pressing.

If the ground has been plowed and the holes have been dug in the fall or early winter, much time may be gained now, and the soil will be in more favorable condition than if the work were left until the spring time.

Ordering Trees should have been done before this. To delay ordering till the day before it is intended to plant, is sure to result in disappointment and loss. Trees ordered and received early in the season are almost always of better quality than late ones; partly because the best or "regular" stock is sold first, and principally because the work of digging and packing is done more carefully before the rush of the season, than when all is hurry and bustle.

Causes of Failure with trees which were originally of first quality are manifold. In digging, too many roots may have become injured, and cut off; defective packing is another cause, but more disastrous than all else is exposure of the roots to air, sun, and wind. A few minutes exposure to drying winds may make all the difference between a future healthy, vigorous tree, and a sickly or dying one.

Unpacking Trees. The roots of trees should never be uncovered for a moment longer than is absolutely necessary. Before unpacking the box or bundle, a wide trench should be dug, into which each tree as it is taken out is to be placed at once, covering its roots with fine soil so that it comes in contact with every part of them, as much as possible. To throw a few shovels of heavy, solid soil upon the roots does not do much more good than a board, still it is better than no protection at all.

A tree heeled in properly may remain for weeks until wanted, all summer in fact, without injury.

Pruning Young Trees is easier and more advantageously done before than after planting, and most conveniently while the trees are heeled in. The better the condition of the roots the less pruning of the top is necessary, yet every tree should be cut back at transplanting, not only to give it proper shape, but to increase its vigor. How much to cut off varies according to the condition of the tree, but on an average one-half to

two-thirds of the previous year's growth should be removed either before or immediately after planting.

Black Knot on Plum and Cherry trees produces new spores early in spring, spreading the disease a thousand fold. The most advantageous time for cutting away afflicted limbs is therefore before new spores have formed. But to do any good the work must be done thoroughly by cutting off every branch that shows the least indication of the destructive Black Knot.

QUINCE CULTURE.

Of all culinary fruits none is more highly prized than the Quince. What housewife is there who does not appreciate this fruit to season, as the saying is, Apple-sauce, even if not abundant enough to preserve by it-

start near the ground, not over a foot or eighteen inches high. Train in tree rather than bush form, that is to a single trunk, as illustrated on the following pages. After planting use coarse manure as a mulch, bearing in mind the fact of the Quince being a gross-feeder.

A Quince-tree in healthy condition will produce an abundant crop of fruit and make new wood from six to eight feet in height. The secret of early bearing is forcing the growth, and severe pruning. Judicious pruning yearly in the fall or winter is a pre-requisite to successful culture. In the culture of all fruits subject to borers, these are a great, if not the greatest, cause of weakening the vigor of trees; hence make an examination in September for them, and if found dig them out most thoroughly.

For general culture the Orange or Apple Quince give the best satisfaction, yet there are at the present time several new varieties before the public, some of which seem to deserve extensive trials, but whatever kind you purchase, give it a fair chance. The difference in the fruit of the same variety, even, between ordinary and good culture, is frequently so marked as to render the Quince problem in relation to varieties not always an easy one to determine by the grower. J. B. ROGERS.

MEECH'S PROLIFIC QUINCE.

Foremost among the new varieties of Quinces alluded to above, stands Meech's Prolific, now introduced by Hance & Borden, Red Bank, N. J. The original tree was brought to Vineland, N. J., by one of the early settlers from Connecticut. In its new home it proved so much superior to the older kinds in cultivation that it attracted the attention of Rev. W. W. Meech, an experienced amateur pomologist, through whose agency its good qualities became more favorably and extensively known.

The late lamented Charles Downing said: "It is a promising variety, and if it proves as good in other localities, and continues its present good qualities of fair fruit and good size, as those sent me, it will be an acquisition to the Quince family. It will take some time to decide fully as to all its merits in various soils and localities, but from what little I have seen of it, I believe it will prove worthy of general cultivation, and I really hope it will."

The introducers consider the variety adapted to all the wants to be supplied by its kind. "It is remarkable for its great productiveness, trees bearing sometimes when only two years old, and every year afterwards with such abundance as to need vigorous thinning. The fruit is of a handsome Pear shape, smooth-skinned, of a lively orange yellow, and of extra size and flavor."

MEECH'S PROLIFIC QUINCE.

self. Precious things, as a rule, are well cared for, yet the Quince is an almost universal exception to this maxim. Why should it generally be planted in situations where no other fruit will thrive? A wet position is selected for this tree, of all others the least able to withstand excessive moisture at its roots. The weakest part of the Quince is the roots. The fine fibres fill the ground with a perfect net-work, running very close to the surface, rendering cultivation, after a few years, impossible, requiring mulching as a protection from the summer's heat and winter's cold.

Select for the Quinces a deep, rich, cool soil, where the whole surface can be exclusively occupied by the tree. The trunk as well as the roots need careful protection. The afternoon's sun should be kept from the trunk by causing the branches to

STRAWBERRY EXPERIENCES.

With each recurring spring, the perplexing question about the best Strawberry forces itself on our attention. We are therefore glad to be able to lay before our readers the results of extended experiments made at the Ohio Experiment Station, under the direction of so careful an observer and exact experimenter as Prof. William R. Lazenby.

The soil upon which the varieties named below were grown, says the Professor, is a moderately rich clay loam, and was enriched with a light coating of stable manure.

All the varieties, except those noted, were planted in the spring of 1883. Ordinary cultivation was given, and the runners allowed to take root, forming matted rows. In the fall the bed was mulched with straw, which was allowed to remain until after the berries were picked. The season was quite favorable, although a slight frost destroyed some blossoms and a drouth cut short the yield of fruit.

Alpha—This proved to be one of the earliest varieties. Berries, medium to large, and quite attractive in appearance. Plants healthy, but only moderately productive.

Atlantic—The plants of this variety were set in the fall, and bore but little fruit. The berries are of good form and color; plants healthy and moderately vigorous.

Bidwell—Failed to fulfil the promises made for it. The plants are healthy and vigorous, but are much inclined to overbear. Many of the berries are small and present a seedy appearance, which with the large size of the calyx renders a box of unsorted fruit unattractive. It would probably give better results grown in hills.

Big Bob—Unsatisfactory in every way.

Charles Downing—This variety bore a very scanty crop, but the berries were all that could be desired. The Downing furnishes a plentiful supply of pollen, hence is a good sort to plant with pistillate varieties. Our experiments show that it imparts to a considerable extent its own glossy appearance to the berries of such varieties as it fertilizes.

Cumberland—Ranks with the Downing as to productiveness, but like it bears much better the second year than the first. It is an excellent variety for home use, or for near markets, where it commands a good price.

Crescent—This variety was the most productive of all those tried. It was also the earliest of any good variety. It has proved to be in this and many other localities the most profitable variety for market.

Cornelia—The plants of this variety were set in the fall, hence it is impossible to give a correct opinion of it. It seems, however, to be a very promising late variety.

Daniel Boone—Fall-set plants gave a good crop. The berries are of good form, size and color; plants healthy, vigorous and productive. This is certainly a very promising variety.

Early Canada—Very early but lacking in

size and productiveness. The berries toward the last are too small to pay for picking.

Finch's Prolific—This variety furnishes an abundance of pollen and is a good kind to plant with pistillate sorts. Its greatest fault is its unproductiveness.

Hart's Minnesota—Plants vigorous and productive. A valuable variety.

Jersey Queen—A very fine berry. Plants are healthy and vigorous but unproductive.

James Vick—The plants are very vigorous and productive, but even the first berries are small, and toward the last of the season are not worth picking. Quality inferior.

Lacon—This is a marvellously vigorous and productive variety. The berries are rather soft, often irregular, medium size and not of extra quality. Hence it is not likely to become a popular sort, either for home use or market. It has, however, too many good qualities to be discarded. It may do better in hills.

FIVE YEAR OLD MEECH'S PROLIFIC QUINCE TREE, BEFORE PRUNING.

Miner—Stands next to Crescent in productiveness. The berries are medium to large, regular, good color and of excellent quality. For home use it is unexcelled, but is perhaps too soft for shipping long distances, although firm enough for near market. It has the fault of not coloring evenly, which necessitates care in picking and packing. This is a good variety to plant with pistillates.

Manchester—This is undoubtedly a good variety in many localities, but it is affected badly by the rust on our grounds. The berries are all that can be desired, but the plants lack the vigor to carry a good crop through.

Mt. Vernon—A very fine late variety, but seems not to be sufficiently productive to be profitable.

Norman—Berries very fine; plants vigorous and moderately productive.

Nigh's Superb—This variety apparently has nothing to recommend it.

Old Iron Clad (Phelps)—Did very poorly here. Plants apparently lack vigor to mature the large amount of fruit that sets. The berries were small and full of hard lumps.

Piper—Berries medium to large; plants vigorous and productive. It seems to be affected somewhat more by the drouth than most other varieties, but it possesses so many good qualities that it is deserving of extended trial. Would undoubtedly do well in hills.

Prince of Berries—The plants were set in the fall and failed to make sufficient growth to produce a crop. Seems to lack vigor here.

Sharpless—Seems not to be perfectly adapted to this locality, doubtless partly because it is so easily affected by frost. The number of stamens and amount of pollen appear to be variable, hence if planted to fertilize pistillate varieties a proportionately large number of Sharpless plants should be used.

Sucker State—Berries very regular and uniform in size; plants vigorous and productive. This is certainly a very promising variety; the objections to it being too light color of fruit, and berries parting too easily from the calyx.

Windsor Chief—This is a vigorous and productive variety, ranking with Miner, next to Crescent. The berries are medium to large, rather acid, moderately firm, but glossy and of fine appearance. It certainly must take high rank as a profitable variety for near market. Would do well in hills.

RUSSIAN FRUITS.

In the extreme northern portion of the United States are large areas within which the Thermometer registers nearly every winter 30° to 40° below zero, and where almost all varieties of English and American Apples winter-kill. To discover varieties suitable for these regions has long been the aim of many pomologists, and it was with this view that Mr. Charles Gibb of Canada and Prof. Budd of Iowa visited Russia to learn what varieties of Russian fruits might be specially adapted to the higher latitudes of America, where most varieties are too tender.

The results of their investigations are worthy of the most careful study. It appears that they found the Anis Apple, the Antonovka, and some others successfully raised as far north as Kazan, 130 miles east of Moscow, far from the modifying influence of any large body of water, and yet 600 miles north of the latitude of Quebec, and where Fahrenheit's Thermometer registers not rarely 58° below zero. In this region of extreme cold the people raised Apples as one of their chief industries, and the trees escaped these severe winters without injury.

These "Iron-clad" varieties will surely become a great boon to the cold sections of the North and Northwest, and from some of the best of these seedlings will undoubtedly be raised that will be about all that can be desired in quality, and hardy as their parentage.

For the wilder portions of the United States, we have varieties of our own sufficiently hardy and of better quality than the Russian Apples. South of the Michigan lakes, of middle Iowa, of central New York, and the latitude of Boston generally, there is therefore little need of introducing Russian Apples, so long as we succeed well with better kinds. And yet the Yellow Transparent, Red Astrachan Alexander, and Duchesse of Oldenburgh, have so many desirable points, that we may forego their extreme acidity, in view of their high colors, strong growth, productiveness, and healthy foliage. Seedlings of these in the near future may be expected to attract the special attention of pomologists by their high claims.

The Russian Cherries, Prof. Budd thinks, we may certainly give a fair trial without risk of much disappointment; these are fine for cooking; some being good for the table, and so beautiful, so productive, so promising, as to merit trial at least. So with Russian Apricots, among which we may, and probably shall, find varieties hardy, productive, and excellent, that will be a great acquisition.

The Russian Mulberry as a choice fruit is a disappointment, and where the Downing can be raised there is no need of trying the Russian for its fruit; of its hardiness there is no doubt.

The journey of Messrs. Gibbs and Budd to Russia will prove of great service to the northern belt of the United States and Canada, and the infusion of Russian blood into our future new varieties of fruits may exert an important influence in the progress of American Pomology. P. M. AUGUR.

PROTECTING VINES FROM FROST.

Late spring frosts, as is well known to fruit-growers, are more to be feared in Grape-growing districts than severe winters, as in the course of but a few hours they may destroy the prospects of a plentiful harvest. The symptoms of frost, which usually manifest themselves shortly before sunrise, unfortunately can only be discovered or detected by careful, vigilant watching throughout the entire night, and even then it is often difficult to foresee them. The preventive appliances hitherto used, such as stationary covers, mats, etc., often possess little value, as from any sudden change in the course of the wind their utility as a shield is only good in one direction.

The formation of artificial clouds, produced by the burning of tar, writes Mr. J. Jouanne, in a recent number of *Le Gaz*, is, without doubt, one of the best protectors.

A row of flat-bottomed, open-mouthed porcelain vases, each containing 5 to 6 kilogrammes (12 to 14 pounds) of tar, is placed around the borders of the land to be protected. The vases are usually set from 20 to 25 meters (66 to 81 feet) apart. To facilitate and hasten the lighting a piece of oakum or a bunch of straw saturated with petroleum is stuck in the middle of the filled

tar vase; with a similar piece of burning oakum, fastened to the end of an iron rod, the contents of the whole row of vases can soon be ignited. Almost immediately a thick, heavy smoke arises, continuing to ascend during the progress of combustion: and being blown by the wind, from whichever quarter it comes, soon spreads over the whole field.

As it is generally during a calm that the frosts are most dreaded, the absence of the wind only tends to increase the thickness of the smoke that issues from the vases and hovers among the vines; it is most efficacious, therefore, at the time it is most needed. The vases should be provided with a lid, made of a simple piece of wood, when it is intended to place them in position in advance of the time of their being needed, in order that their contents may not be exposed for too long a period to the action of the elements. These tar pots, arranged in this manner, and on the side of the field most exposed to the prevailing winds, are ready to be at once put to the use of pro-

FIVE YEAR OLD MEECH'S PROLIFIC QUINCE TREE, AFTER PRUNING.

tecting the vines as soon as the first symptoms of frost are felt.

In order that the vine-grower may be notified of the near approach of the frost, the following is suggested. A mercurial thermometer should be armed with a float and an electric contact, so arranged that when the column of mercury would fall to a degree corresponding with a temperature approximating near to a hoar frost, the circuit of the pile attached to the thermometer would be closed, and thus put in action an electric alarm clock. This clock could be stationed in the proprietor's sleeping apartment, or in that of his superintendent; the thermometer might be placed in the field, or in any convenient location outside the house, in such a position as to be at once affected by any decided change in temperature. By this means the frost itself would sound the signal of alarm, and all would be in readiness to avert the threatened danger.

FRUITS OF THE FUTURE.

The methods of cross-fertilization and hybridizing are now so generally understood and so easily learned, said the Hon. H. M. Engle before the Pennsylvania State Horticultural Association, that more should apply themselves to this work. True, it is like a lottery, where the large majority draw blanks; but nature would not be true to herself in permitting stock breeders to obtain their ideal, and refusing the same knowledge in the vegetable kingdom; for if stock breeders can by proper selection breed beef, or butter, or milk qualities, or size, or color, or dispense with horns, why may not similar ends be obtained in the vegetable kingdom? Why not establish varieties of Apples without cores, of which we hear occasionally, or Peaches without seeds, as we find now and then very fine specimens with only the rudiments of pits? May we not hope that the laws which govern such matters will be known in due time. Meantime, let all who can raise new seedling fruits and flowers observe closely, and keep a record of all items of interest that may seem new. Crosses should be made by design, which would form a reliable basis for future operation.

Especially would I induce women to engage in this delicate work, since they can manipulate such fine processes better than men. A beautiful and enchanting, and a possibly profitable field is here open for women.

SHORT CUTTINGS.

The Duchess Grape is rapidly growing in favor.

Experience teaches that while irrigation increases the size and quantity of fruits, it, at the same time, deteriorates quality and color.

A tree derives about as much nourishment from manure spread close around its stem, as a horse would from a bag of grain fastened to its back.

Large crops are not always the most profitable; quality rather than quantity is growing in appreciation, and purchasers desire large, showy fruits, of good quality, in preference to inferior ones.

The principal conditions for successfully growing English Gooseberries in our country are a rather heavy, cool soil, heavy mulching during summer, keeping the bushes open in the center, and when they start into growth in spring, disbudding so as to prevent over-bearing.

The prospect for fruits in Illinois is gloomy enough. The Peach crop is gone, says the Editor of the *Farmer and Fruit Grower*, the Pear twigs are badly frozen and many Apple-trees are injured. Strawberry fields are badly lifted, and not able to yield more than two-thirds of a crop. Blackberry and Raspberry canes are damaged considerably in exposed places. All fruit crops are likely to be small.

The Flower Garden.

EASTER BELLS.

Lent was dreary and late that year;
April to May was going;
But the loitering moon refused to round,
And the wild southeast was blowing.

Day by day, from my window high,
I watched, a lonely warder,
For a building bird in the garden trees,
Or a flower in the sheltered border.

But I only heard the chilly rain
On the roof of my chamber beating;
Or the wild sea wind to the tossing boughs
Its wail of wreck repeating;

And said, "Ah me! 'tis a weary world
This cheerless April weather;
The beautiful things will droop and die,
Blossom and bird together."

At last the storm was spent—I slept,
Lulled by the tired wind's sighing,—
To wake at morn with the sunshine full
On floor and garden lying:

And lo! the hyacinth buds were blown;
A robin was softly singing;
The cherry blooms by the wall were white;
And the Easter bells were ringing!

I think of the garden after the rain;
And hope to my heart comes, singing,
"At morn the cherry blooms will be white,
And the Easter bells be ringing!"

—*Youth's Companion.*

SEASONABLE HINTS.

Some of the sweetest and most desirable flowers for cutting have been driven from our gardens because no place can be found for them in the formal moder ribbon bed; and yet every person endowed with good taste admires them when found in vases and jardinières in the homes of friends.

Sweet Peas are not excelled for this purpose. Ah, I forgot to plant *Sweet Peas* this summer! is an exclamation heard frequently when it is too late for sowing; but seasons go and seasons come, and they are forgotten again. If you want the most beautiful return in sweet flowers for the smallest outlay, plant *Sweet Peas*. Sow as early as the condition of the ground permits, select a rich, warm location,—in the kitchen garden does very well, if they cannot be admitted in the stately flower garden,—mark out drills three feet apart and drop the seeds two to three inches apart. If sown thicker they will not give much satisfaction. When above ground, give short brush, as with common Peas, keep the ground hoed, and if you want an unlimited supply of flowers, cut daily and allow none to go to seed.

Pansies for autumn blooming may still be sown in a gentle hot-bed or in the house in pots placed near the window. As soon as the plants are large enough they have to be pricked out, and later transplanted to a prepared bed shaded from the midday sun. This shading is an important part, as the Pansy is a cool climate plant that cannot stand our fierce sun without this precaution being taken. In dry weather water has to be given daily; and all flower buds must be pinched off as they appear until the cooler autumn weather. Plants in flower now will continue to bloom much longer and better if the flowers are taken off every day. You can never have too many, place them in every room of your house, and gladden the hearts of your friends with gifts of *Pansies*.

MORNING GLORIES.

IPOMŒA.

The great interest that has been taken lately in the Moon Flower *Ipomœa Noctiflora* induces me to call attention to a few other species of this beautiful genus of mostly climbing plants. Many of them are popular for their fine foliage and large showy flowers that will always attract attention or admiration in whatever situation they are to be found.

The *Ipomœas*, or as they are popularly called Morning Glories, form a very extensive genus of twining or climbing annual and perennial plants of rapid growth during the summer season, attaining a height of from ten to thirty feet, and covering almost as much in breadth with their bright green foliage, the magnificent white, blue or purple flowers which are produced from the axils of the leaves in the greatest profusion from early in the season until the plants are destroyed by frosts in the fall.

But very little care or skill is required to cultivate them successfully, and they may be grown in any situation where they can be given a well enriched, deep soil; and during our hot dry summer weather a good mulching of course stable manure will be found of decided benefit to them. Support should be given early in their growth before the plants commence to run, and during their season of growth they should be occasionally examined and their shoots trained so as to occupy the desired space.

The most preferable method of obtaining strong and healthy plants is to sow the seeds in a well drained pot of light loamy soil early in spring. Place the pot in a warm, light situation, and keep the soil moist, but not over-watered. As soon as the young plants are strong enough to be handled, transfer them into three inch pots; keep them close and moist until well established then remove to a cooler situation, and gradually expose to the open air, and plant out when all danger of frost is over.

I. Leari is a tender perennial species, and one of the most beautiful and useful of all; it is of vigorous rapid growth attaining a height of from twenty-five to thirty feet, and its large blue flowers are produced in the greatest profusion. The seeds of this species should be sown early in February and the young plants encouraged to grow as rapidly as possible. A few cuttings taken in the fall will give a supply of plants for the ensuing year, or the old plants may be cut back on the approach of cold weather, taken up carefully, potted, and placed in any situation where a winter temperature of 50 degrees can be maintained. Water sparingly, as the object is to keep the plant in a partially dormant state.

I. rubro-cœrulea, and *I. rubro-cœrulea alba*, are also varieties of rapid growth attaining a height of thirty feet and should be given a treatment similar to that advised for the preceding, but as they are annuals it is of no use to try to preserve the plants through the winter. Young plants must be obtained from seeds every season.

I. Umbata elegantissima has very beautiful large flowers with rich bluish purple center in the form of a star, with a broad pure white margin, and grows from fifteen to twenty feet.

I. hederacea superba grows from ten to fifteen feet in height and has bright, blue,

white tinged flowers and Ivy like leaves.

I. coccinea, commonly called the Star *Ipomœa* grows from ten to twelve feet high, and has small scarlet flowers which are produced in the greatest profusion.

I. Burridgii grows from twelve to fifteen feet high, and, in its season, is completely covered with bright crimson flowers.

Although those named are among the most desirable and easiest grown there are many other beautiful species and varieties worthy of a place in the flower garden.

CHAS. E. PARNELL.

HOW TO RAISE CUTTINGS.

If we would have our gardens gay with flowers the coming summer, we should now make cuttings from the *Geraniums*, *Verbenas*, *Heliotropes*, *Fuchsias*, etc., wintered in the house, all of which will root quickly if the needed light and moisture required for their growth are given.

The old-fashioned way of rooting cuttings in a small glass bottle, filled with water, is an excellent method when a hot-bed cannot be obtained, but care must be taken not to let the bottle stand so close to the window pane that the water will become too hot, and thus scald the tiny rootlets. If large-mouthed bottles are used, and many cuttings are placed in them, cover the outside edge and a little of the inner rim of it with cotton wool. This will prevent the evaporation of the water, and what does dry up should be replenished with tepid water.

In two or three weeks the bottle will be full of the tiny white roots, and then the cuttings must be transplanted into thumb pots, or, if the season is favorable, they can be placed in the beds where they will grow rapidly, and soon put forth buds and flowers to repay you for your labor. As you take each cutting from the bottle, dip the roots into a little sand, slightly warmed. This will keep them apart and make them grow better and prevent the cuttings from wilting after transplanting. Stir the roots gently in the sand, until each fibre becomes well coated with it. If pots are used, fill them nearly full with a rich, sandy compost, and press it towards the edges of the pot, so as to leave room in the centre for the roots. Put them in gently and give the plant a little twist to throw out the roots, or spread them out carefully with a hair-pin. Then put in more soil and press it tightly about the roots. Tight planting is one of the secrets of success in raising plants from cuttings, for if the soil is lightly thrown in, and no heed is taken to make it in close contact with the roots, they cannot start into growth as quickly, and will often wither up. Water the young plants well, and shade them from the hot sun for two or three days and you will not lose one of them.

Cuttings can also be started in pots of sandy compost, with a glass tumbler placed over them to confine the moisture, which, if not given, will cause the cutting to wilt and die, but if kept under glass and shaded from the sun for two days or so, it will not wither a leaf. Then place the pots in the warmest window, with a south-eastern exposure, and they will soon show signs of growth.

Wet sand is also excellent for growing cuttings, and they can be started in it quicker than in compost, but a shallow pan

or saucer is better than any deeper receptacle. Fill it up with sand,—not sea sand, but common yellow sand, and wet it sopping wet, then press in the cuttings with the fingers, planting them very tightly, and keep it very wet all the time, because if allowed to dry up at all, their growth will be checked, if not destroyed. When the old leaves have dropped off and new ones show themselves, root growth has commenced, and in two or three days the plants can be transplanted into pots filled with light, sandy loam. After shading a day or two they can have all the sunshine that is obtainable, and sufficient water to keep them moist must be given. This is so simple a process of starting cuttings that a child of eight years can grow them without difficulty.

There is, however, some skill in selecting cuttings, as they will always strike root better if taken from the fresh growth of a plant rather than from hardened wood. If a branch of a Geranium, Feverfew or Verbena will break off readily, it is in a right state to grow rapidly, and it is better to break it off than to cut it, because it leaves an irregular surface from which the roots will put forth more quickly. Other cuttings, like those of Roses, Heliotropes, etc., will grow better if taken at the junction of the old and new wood, and they should be cut off just below a joint or bud, as the roots start from that point, and if a bud is not left near or close to the base, the cutting is liable to decay in the soil.

Many of the hard-wooded shrubs and plants are most easily propagated in the garden. Cut off young shoots with a little old wood attached, and plant them with some sand at their base, and you can raise Wigelias, Duetzias, and all kinds of Roses in quantities. But the more tender Fuchsias, Verbenas, Heliotropes, Carnations, Calceolarias, and Geraniums, must be raised under glass, or in sand, in-doors, if you would possess a good supply of bedding-out plants wherewith to decorate your parterre in the coming summer.

DAISY EYEBRIGHT.

THE SHOWY LADY SLIPPER.

Cypripedium spectabile.

Prominent among our most beautiful native herbaceous plants are the Lady Slippers. All the species, six of which are indigenous to the Northern States, are interesting, closely resembling in their flowers the gaudy epiphytic forms of the tropics; but *Cypripedium spectabile* with its large, pure-white flowers tinged with purple in front is the most showy. The stem is thick, leafy, about two feet high, and bears two or three flowers. It is found in peat bogs and swamps, from New

England to Wisconsin, and southward along the Alleghanies.

For cultivation out-doors a cool, damp, half-shady situation, and a bed of peaty earth is most suitable, but it may also be grown in ordinary soil, provided the surface is kept well mulched during summer with swamp moss, which retains moisture better than any other material.

The plants may also be kept in pots in a frame, which is generally the most successful mode of culture. In either case they do not like to be disturbed much, and should therefore not be transplanted oftener than becomes absolutely necessary. When removing them from their native locality,

CYPRIPEDIUM SPECTABILE.

which is best done when the plants are in bloom, as large a ball of earth as practicable should be taken up with the roots. For forcing in winter they are well adapted, and clumps of flowering plants may be seen in our florists' windows at this season.

[For the accompanying illustration from Henry Baldwin's charming work on the Orchids of New England, we are indebted to the publishers, Messrs. John Wiley & Sons, New York.]

Among the best plants for edging carpet beds are: Alternanthera, Achyranthes, Armeria, Pyrethrum, Echeveria, Sedum, *Oxalis Deppei*.

THE ADONIS.

An annual that deserves more attention than it gets, is the Adonis. I do not understand why it is not more frequently used, for it is sure to be admired when grown well. It is a plant of very easy cultivation. It does best in a rather sandy soil, well enriched with old manure.

There are but two distinct varieties in general cultivation. One of these, *estivalis*, is a summer bloomer, of a bright scarlet. The other variety, *autumnalis*, is, as its specific name indicates, a fall-bloomer, and is of a rich blood-red color. It has broader petals than the summer-blooming variety, and is one of our best plants, at least among annuals, for use in the garden during the latter part of the season. The foliage of both varieties is very fine and feathery, and affords a pleasing background against which the brilliant flowers are effectively displayed. The plants will bloom well in shade.

To obtain the best satisfaction from the Adonis, it should be used in masses, as, when grown in that way, if the plants are set about a foot apart, it completely covers the ground, and one sees a compact body of rich foliage, starred over with brilliant flowers. R. E. E.

OUR FLOWER BASKET.

Most Lilies thrive best among clumps of Rhododendrons, and in the borders of shrubberies.

The Clematis is not only among our very best climbers, but is also admirably adapted for bedding purposes.

Violet plants should be started early in spring, so that they may be well established before the summer drouths commence.

In the arrangement of cut flowers it is well to bear in mind that "green gives character, white gives brillianee."

A heavy mulch of Tobacco stems on Rose beds is not only an almost infallible preventive of blight, but serves also as a most excellent fertilizer.

All the innumerable forms and variations in Pansy flowers may be arranged into six distinct classes, says Albert Benz, viz.: 1, Self Colors; 2, Shaded; 3, Three-spotted, or Face; 4, Five-spotted, or Odier; 5, Edged or Bordered; 6, Fancy Pansies.

Honeysuckles and most shrubby plants can readily be propagated by bending down a branch in spring and covering a portion of it with soil. In autumn it will be rooted, and may be separated from the parent plant, and transplanted.

The Window Garden AND GREENHOUSE.

THE WINDOW GARDEN FOR APRIL.

Our window plants now are growing and blooming freely. Arrange that the stronger do not smother the weaker ones. Water copiously all plants in vigorous growth, using water that has the chill taken off rather than very cold water right from the cistern, barrel or well.

Attend to shortening the shoots to preserve the plants in stocky condition, and use the tips you cut off as cuttings.

Re-pot such plants as need shifting, and prick out and pot or box young seedlings, or pot or box off rooted cuttings before they get drawn, crowded or otherwise weakened.

Continue to strike cuttings of all plants which you desire to propagate, also sow seeds. If you have not space for all of your young plants close up to the glass in your windows, remove the hardier kinds of them to a cool room. Here they are less apt to become spindly than in the warm room.

Ventilate freely every warm and sunny day, by opening the windows early in the day and shutting them early in the afternoon. Avoid draughts. If the warm sunshine causes any of the plants to wilt, a screen of thin mosquito netting drawn between the plants and glass or on the outside of the window will be of much service, but it should be removed at all times except during warm sunshine.

With our old plants, newly rooted cuttings and young seedlings, our windows will, probably, be getting rather crowded, but if we may have such auxiliaries as hot-beds or cold frames, we can find relief.

HOT-BEDS.

Directions for the construction of hot-beds have been given in former numbers of THE AMERICAN GARDEN, so that it will not be necessary to repeat them here. If you wish to strike cuttings in the bed or put into it the small plants from your windows, then an inch or two of sifted coal ashes over the manure is as good as anything to set the pots on or plunge them in.

When we have many kinds of flower-seeds to raise in a hot-bed, I prefer sowing in shallow flats and setting these in the bed. In this way if one kind of seed takes longer to come up than another, I have not to wait for it before using the space vacated by the early seed, but, instead, can move out and crowd up the boxes.

COLD FRAMES

Are excellent places for wintering Violets, Polyanthus, Anemones, Forget-me-nots, Pansies, Biennial Stocks, Wall-flowers, and the like; for giving us flowers from March to May; also for wintering summer-blooming Carnations, Penstemons, and other herbaceous perennials almost but not quite hardy.

But apart from their use as winter quarters to these, cold frames in spring are excellent places in which to start seeds of Zinnias, Stocks, Asters, Marigolds, Mourning Bride, Drummond Phlox and many other plants, to be in time transplanted to our beds and borders.

Carnations, Paris Daisies, Verbenas, and many other plants can be put out into cold

frames, not only for convenience' sake, and to have them near the glass, but as a place in which they can readily be hardened off before being planted out for the summer.

Geraniums, Stevias, Ageratums, Lantanas, Hibiscuses, Cape Plumbago may now be transferred to the cold frame with benefit to themselves, providing frost is not allowed to reach them. But Coleuses, Iresines, Alternantheras and similar tender stock should not be trusted in a cold frame before May.

Cold frames containing tender plants should be shut up early so as to retain some extra sun heat, and covered up well at night. In warm weather the sashes may be removed by day, but in cold weather or on the occasion of sleet or drenching rains keep on the sashes day and night.

HARDENING OFF PLANTS.

No matter how hardy a plant may be, if wintered in a window frame or greenhouse, it should not be planted out in the garden in spring without first being well hardened off. Therefore we should not be entrapped by the moist and sunny weather we usually have towards the end of April, in suddenly putting out of doors to stay out any of the tender plants we have wintered in-doors. It is inconsistent that we should trust tropical plants to the mercy of our northern weather, before our own Oaks, Hickory, or Indian Bean have spread a leaf or burst a bud. Putting our plants outside to get the benefit of a warm, gentle shower does them much good, but we should bring them in-doors before night.

VIOLETS.

Those that have been blooming all winter long, will, toward the end of the month, begin to grow and spread considerably and cease flowering. As soon as that is the case lift the clumps, break them up and secure all the good, strong side shoots—most of them will have a few shoots—and plant them closely in a cold frame in sandy soil as you would cuttings. They will soon begin to root nicely, when, after being gradually hardened off, they may be planted out in rows in the garden. These young plants make the best stock for blooming next winter.

WM. FALCONER.

TUBEROUS ROOTED BEGONIAS.

Of all beautiful plants for summer pot-culture I know of nothing more attractive than the new Tuberous Begonias. For three years I have grown them and find them so easily managed that I can highly recommend them.

Little tubers, about half an inch across, purchased three years ago this spring, are at this time three inches in diameter. All last summer, and from their earliest growth, they were a mass of flowers, but the tubers have grown with surprising rapidity, and what was one last year I propose to divide into four this season. They are as easily divided as Gloxinias, and unless wanted for bedding out or large specimen plants, it is better to divide large tubers and start the parts in small pots of sandy soil and repot as soon as well rooted, filling in about the ball of earth as slipped from the small pot, with rich porous loam. They are vigorous growers, and soon fill small pots with roots which hold together nicely in slipping from one crock to the other.

Tuberous Begonias should be potted as early as convenient in the spring. Much of future usefulness depends upon rooting well before leaf growth commences. All are liable to push early. Therefore it is necessary to watch closely, as the beauty and symmetry of the plant is very materially injured by an early, tender growth. It is a good plan after potting summer-flowering tubers, to keep them in a dark place, moderately warm, until convenient to place them in the window garden. But by all means bring them immediately into light and sunshine as soon as they show a determination to grow. Unless well started and blooming before the usual hot, dry days of our summer months, it will do little or no good. All delight in a rich, porous soil, and only with divided, fresh-cut tubers sandy soil—that is more sand than loam—is preferable for starting.

I have no greenhouse or conservatory, and speak strictly from window garden experience. By using small pots for the beginning, one can often find room for starting a large collection of these choice and novel plants, beautiful in foliage as well as flower.

S. C. H.

THE ABUTILON.

One of the best plants for the house is the Abutilon, better known, perhaps, as Flowering Maple, from a resemblance of the foliage, in some varieties, to that of the Maple of our woods, and sometimes called Fairy Bell, because of its pendulous, bell-shaped flowers. It is a plant that grows well under circumstances not favorable to the satisfactory development of most plants, being able to withstand dry air and the gas emanating from coal fires. In this respect it is quite equal to the Geranium. It has very pretty foliage, and its flowers, while not as showy as those of many other plants, are very pretty and attractive, and are produced almost constantly. This is one reason why it is such a favorite, wherever grown, for it is rarely without a few flowers.

There are many varieties. One of the best is Boule de Neige, pure white, and a profuse bloomer. Santana is the nearest approach to crimson of any I have tried. The old variety, bearing yellow flowers, veined with scarlet, has the best habit of growth, and, to my mind, the finest foliage. The variety *Thompsoni* has leaves beautifully blotched with yellow, the blotches having the appearance of mosaic-work. It is a free bloomer, its flowers being yellow and crimson. [A double form of *A. Thompsoni* has recently been introduced by Peter Henderson & Co., New York, to whom we are indebted for the accompanying illustration. It originated in a "sport" which, while it retains the beautiful mottled yellow and green foliage, produces flowers that resemble in form a double Hollyhock.—Ed.]

There is a variety of slender growth, *veillardii*, which has long leaves in which the variegation of yellow is very effective. This variety is of great use for baskets, or to grow in pots occupying an elevated position where its long branches can droop to suit themselves. They should never be tied up, or trained in any way, if you would get the best effect of the plants. I have a plant of it in my collection which completely covers the pot in which it grows, and gives

one the impression of a plant bathed in sunshine, because the yellow in the leaves is so bright.

The Abutilon will grow well in any good soil. If care is not taken to make plants bushy, by pinching in well while young, they will grow tall, and have few branches; but, if kept well pinched back, many branches will start, and it is easy to make shrubs of them, or pretty little trees. If the tree-shape is preferred, train the plant to one stem until it has reached a height where you want the head to form. Then cut it off. As soon as branches start at the top—all others must be cut off—pinch them back to within a few inches of the main stem. Keep up this pinching-back until you have a dozen branches started. Then you can let them grow for awhile; but after they have reached the length of a foot or more, it is well to cut off the ends, to thicken up the plant.

In growing *A. vexillarium* for baskets, the branches must be made to grow low on the plant, therefore do not allow it to grow tall before pinching begins. Begin this early, in order to get as many branches as possible. The plant is easily managed, if one perseveres in pruning by pinching.

The Abutilon is seldom troubled by insects of any kind. In this respect it is equal to the Geranium. It will endure a lower temperature than most window plants without injury. It grows readily from cuttings. Small plants can be procured of any florist, in spring, for 15 or 20 cents; these will become good-sized by fall, and will help to make the window bright and pleasant through the winter months.

E. E. REXFORD.

CALLAS.

The Calla Lily, as it is popularly called, is one of the most desirable window plants, and yet it is not generally successfully managed. Those having plants will do well to keep them growing in a light, sunny window during the spring months. If they have not flowered, do not lose patience and set them in the background; bear with them until the first of May, then find some shaded, damp corner in the garden, and in this plunge your plant over the rim of the pot. About twice a week during summer carry along with you a basin or watering-can of soapy water, and give your Calla a dose.

Toward the middle of September dig it up, and if the pot appears too small for the plant, get a pot one or two sizes larger, turn the plant out, transfer it into the larger pot without breaking the roots, and place it in the lightest, sunniest window at command. As it begins to grow, give plenty of water and frequent stimulants and by Christmas, if these directions are followed, you will be sure to have flowers. After the flower-buds appear, the plant may be placed in a very warm position without injury from ordinary changes of temperature. JOHN THORPE.

GREENHOUSE FUMIGATION.

Fumigating plants, says Jostali Hoopes in the N. Y. Tribune, is, in the hands of an experienced gardener, perfectly safe with rarely an exception, and always efficacious. Some species of plants will not stand even a small amount of the fumes,—as the Ferns and Heliotrope, for instance,—but these are exceptional. It is better to smoke a little and often, than to fill the house full of dense, hot smoke at one time. The stems must never be allowed to blaze, but be sufficiently damp to smoulder and emit the destructive fumes. This is so penetrating that when the greenhouse adjoins the dwelling, it seems next to impossible to prevent the odor from finding its way into the latter. A damp cloth fastened over the connecting door or window, however, will in part remedy the evil.

Our best gardeners fumigate regularly once a week, and none less than every alternate week, believing that "an ounce of prevention is better than a pound of cure."

DOUBLE, VARIEGATED ABUTILON.

This systematic smoking prevents the aphides from obtaining a foothold in any considerable number, and a less amount of smoke will asphyxiate them. It is a good plan to syringe the plants in advance of fumigation, and then again after the smoke passes away.

Another method is suggested by a correspondent, that of evaporating a strong decoction of tobacco, filling the greenhouse with the vapor. This is easily done by setting a lamp inside of a stovepipe collar, so that the top of the chimney reaches to its top, while below there is a draft provided for. A pan containing the tea is set on the top of the collar on two pieces of wire, which leave an opening large enough for draft-exit. This vapor reduces and checks the fly when used once or twice a week, but there are always some left unasphyxiated.

Bulbs of Hyacinths, Tulips, Narcissi, that have bloomed during the winter months, should be kept dry until planted out doors.

OUR WINDOW BOX.

Furnace gas is one of the deadliest enemies of house-plants.

Lysimachia nummularia, the moneywort, though old and common, is one of the best and prettiest basket plants.

Soft-wooded plants should always be placed nearest the light, while hard and smooth-leaved ones will not suffer in quite shaded situations.

Leaf-mold, rotted cow manure, and good garden loam in equal parts, with a small addition of sand, well mixed together, makes a suitable soil for nearly all plants.

One part of kerosene beaten thoroughly with two parts of common soft-soap, and then mixed with water, forms an effectual remedy for red spider and mealy bugs.

Ferns are among the prettiest and most satisfactory window plants. Some of our native kinds are highly ornamental and may be had for the trouble of digging them up in the woods.

"There can be no surer indication of a happy home than a flower-decorated window, or neatly kept garden, however small it may be," says the author of the Window Flower Garden.

To prevent the frequent breaking of large flower-pots, the Germantown Telegraph recommends to place around them as they are purchased a single line of wire—copper being best—just underneath the rim of the pots.

Cobaea scandens is one of the best plants for training up the sides of a hay window. Wire may be fastened along the sides and over the top, on which to train the vines, which will soon cover the wood work and hang from the top in graceful festoons of delicate green.

For a small, choice collection of Geraniums, J. G. Barker recommends, for single, General Grant and Orbiculatum, scarlet; May Queen and Master Christine, pink; Miss Gertrude and Mrs. George Smith, salmon; and Pauline Lucea and Snowflake, white. For double varieties, Bishop Wood, crimson shaded with cherry red; Henry Cannell, bright scarlet, and Mme. Thibaut, pink.

Ever since THE AMERICAN GARDEN commenced its mission—and a sweet one it is—I have been a subscriber.—Mrs. L. G. Mason, Charlotte Co., Va.

I take the . . . but there is more practical information in your January number than in the January and February numbers combined of that magazine.—R. E. C. Bardwell, Yates Co., N. Y.

The March GARDEN is certainly the handsomest paper printed, either here or in Europe. I have never seen cuts nor type look equal to it. Your advertising patronage is simply "immense."—A. Blanc, Philadelphia.

Lawn and Landscape.

MAGNOLIAS.

The advent of actual spring is heralded more conspicuously by the flowers of certain varieties of Magnolias than by those of almost any other tree. The blossoms of these Magnolias seem during late spring to have really come too early, for we find them venturing forth in great numbers during April snow-storms, when the tree itself is bare, and, we might fancy, shivering with cold for want of its regular garment of leaves.

We should, perhaps, however, for the purpose of lawn planting, classify the hardy Magnolias into two divisions, consisting of those that bloom before the leaves are formed, and those that bloom in June when the foliage is in full panoply.

Of those that seem in haste to bloom, the most conspicuous is the Chinese Yulan Magnolia, fitly termed *M. conspicua*. The earliest and perhaps the most beautiful is the star-shaped, Clematis-shaped, water-lily-shaped *Magnolia stellata*. The charms of the Yulan, or, as it is interpreted, the Lily Magnolia, have been long recognized and celebrated, and can hardly be praised too highly for anyone who has seen a specimen thirty feet high, covered with thousands of white, sweet-scented blooms, a snowy pyramid of flowers without a green leaf to be seen. Each individual bloom is some three or four inches long by as many inches broad, cup-shaped and of firm texture. The foliage when it appears is of good size, fine appearance, and vigorous. *Magnolia conspicua* is hardy in the latitude of New York after it has become well established, but during extreme youth and the first year after transplanting, it is occasionally cut off by cold and changeable winters.

Several forms of this Magnolia are used on the lawn, one of the best of which is *Magnolia Soulangeana*, a hardy, vigorous variety, of a purple tint on the inside of the cup and base of the petals. *Magnolia Lenei* is a royal purple variety of much vigor, but in some localities it is less hardy than *Soulangeana*.

The other early-blooming species referred to was *Magnolia stellata*, a Japanese variety of surpassing beauty. It is the earliest of Magnolias, and sometimes has its petals touched with severe late frosts, but except on rare occasions the pure, translucent, white flowers blossom in perfection, covering with a thickly-set, rounded mass the entire contour of the branches. The delicate rich perfume, moreover, emanating from the mass of flowers, forms a great attraction to the bees. This Magnolia is dwarfed and more truly a bush than any other hardy species, while it is at the same time more capable of sustaining the stress of sudden changes of heat and cold and transplanting. There are several other Magnolias that bloom before the leaves appear, but we have considered the most important.

Of the Magnolias that bloom in June after the foliage has developed, the finest, perhaps, for both leaf and flower, are two Japanese species, *M. hypoleuca* and *M. parviflora*. The foliage of *hypoleuca* is large,

silvery underneath, and red veined; that of its companion, *parviflora*, is less striking, though rich and effective in texture and hue, but in odor it surpasses all other hardy Magnolias, being strongly and delightfully spicy. The flower of *parviflora* is also remarkably beautiful, consisting of a milk-white cup-shaped form, suggesting remotely the bloom of *M. glauca*, and a magnificent crimson center of curiously arranged pistil and stamens. The odor of *hypoleuca* is also strong and pleasant. These late Magnolias do not bloom as abundantly as the early flowering species and varieties, but their general effect on the lawn as large trees, whether in bloom or out of bloom, is always fine. Unfortunately they are, as yet, comparatively rare.

Magnolia acuminata, *tripetala* and *cordata*, all native species, are excellent late-blooming fine-foliaged trees for the lawn, but of all American kinds, *Magnolia macrophylla* is the most effective, with its great leaves, eighteen inches to two feet long, giving it the effect of some great tropical Palm astray in the North. It is strange that this large-growing, splendid tree is not planted more, for it is quite as hardy as other Magnolias.

The thought naturally arises as we consider briefly a few of these attractive trees, of which over a score are named in nursery catalogues, why more are not used on the lawn. It is, in the first place, because they are difficult to propagate and consequently expensive, and, in the second place, because they have peculiarly sensitive roots which make them difficult to transplant except under special conditions.

These special conditions are young, vigorous, fibrous rooted, two years transplanted, low-grafted specimens set out just as the flower is in full bloom or the leaves just starting. Like all other trees and shrubs that are difficult to transplant, the roots of Magnolias must not be allowed to become dry from exposure to sun and wind, nor must the soil and air be parched and hot at the time of setting out. It is an excellent idea to mud the roots well before setting out.

S. PARSONS, JR.

TRAINING ORNAMENTAL TREES.

Tastes differ in regard to form, and while some like a finished uniformity of outline, others dislike any approach to sameness. I have noticed an article in a widely circulated agricultural journal, by a farmer, in reference to trimming street trees. He recommended trimming up the stems to ten feet, and then by means of a card board, either circular or oval, held before the eye as a guide, trimming the outline of each tree to an exact and regular figure, each the counterpart of its neighbor.

Trimming is evidently this man's ideal of horticultural pleasure, and having traveled in France he had had his inherent American disposition to use the "little hatchet" stimulated in a new direction, by observing the stiff and studied rule-of-thumb methods of dealing with trees and shrubbery in that country.

Most of our villages have an ordinance obliging people to trim off the lower limbs of street trees to a height of ten or twelve feet. This seems necessary to avoid the various obstructions, but between these,

too close planting and the mangling of the tops by telephone companies, our method is no more satisfactory than the French. The example of the cramped, narrow, spindling tree of the village street constantly before us is injurious, deadening the sense of the beautiful in natural trees, and leading many persons to go through the world with ideas in regard to this matter as cramped and distorted as the trees themselves.

We should always bear in mind two facts in regard to trees: one that each tree has a beauty peculiar to itself; the other that this beauty is only fully developed where a tree is completely exposed to the air and light, unhindered by contiguous trees. There is of course a beauty of trees in groups, and the combined outline is often delightful, but there is a constant struggle going on within the group, and the inner branches die, and sooner or later the group loses its beauty, while exactly the opposite takes place in specimen trees of our best varieties, which increase in stateliness and beauty as they grow older.

Another class of smaller trees is so constituted that it thrives under such conditions, blossoming and forming striking objects of beauty beneath the drip, or in close proximity to larger trees. The Hawthorn, Dogwood, Red-bud, and Service-berry are among these, and are highly useful in making an artificial copse or deciduous background. But even these trees have a characteristic beauty that is wonderfully enhanced when allowed independent development. In fact, our most desirable trees need little if any trimming, except when very young, and then it should be done by nipping in the bud rather than by excision.

Here is a beautiful field for experiment, education and amusement open to ladies. The growing of ornamental trees from seed, and directing their youthful branches into positions that will make them objects of marked beauty in after years, is full of interest and fascination.

Next to giving a tree plenty of room, allowing it to branch low is most essential to its most beautiful development, to promote which the overhanging branches should diverge from the main trunk at a height not to exceed four and one-half feet. There should not be less than three main branches, and these may be kept free from ramifications up to such a height as may seem desirable. All this preliminary work should be done while the tree is yet in the nursery.

Much hacking and mutilating of ornamental trees might be avoided if people would plant with a regard to the space to be filled, the prospective hiding of desirable views in later years, and the character of trees desired. If the taste is for broad trees, and the lawn is extensive, then plant spreading kinds like the Oak and Chestnut. If the space is narrow and the preference is fastigiate forms, then plant the Lombardy Poplar, the Upright Cypress, the Irish Juniper and other trees of this character, forms which, by the way, are far too scarce. There is a wide opening in this direction for originating and discovering trees with an upright habit of growth. What an imposing and striking object a Maple, with the form and height of the Lombardy Poplar, would be in autumn.

Foreign Gardening.

NOTES ON THE CATTLEYAS OF THE AMAZON.

During a residence of some eight years in Para and on the Amazon we have received many letters asking information as to Amazonian Orchids. The notes given in Orchid manuals that a certain Orchid comes from Brazil, lead many to suppose that it comes from the Amazon, whereas the Amazonian region, vast in extent as it is, comprises only a small portion of the immense empire of Brazil. The two genera of Orchids concerning which there is the most inquiry (and well do they merit the attention) are *Cattleya* and *Laelia*. Now there is not a *Laelia* of any species in the Amazonian valley, nor, as far as our knowledge extends, have any ever been found on any of the Amazonian tributaries. To the north *Laelias* are found in Mexico and Guatemala, but the Brazilian *Laelias* are natives of the southern provinces, generally in the region of Bahia or Rio de Janeiro, and thence toward central Brazil. The large genus of *Cattleya* is also sparingly represented in the Amazon valley, the great proportion of the Brazilian *Cattleyas* being natives of the same regions as the *Laelias*. But as compensation for the lack of number the Amazonian *Cattleyas* are pre-eminent for their beauty.

To one who now has only to wire them on to the trees or on to blocks which hang on the fences, to have them establish themselves at once and bloom profusely, the general complaint that they do not thrive in cultivation would augur want of proper care, did not his experience in times past in their culture in the Orchid-house lead him to believe that they are not easily grown. A few notes as to the conditions under which they naturally grow may furnish some suggestions as to their culture.

The *Cattleyas* of the Amazon are *Cattleya superba* and its varieties, *El Dorado* and its varieties, *luteola Wallisii* and the almost unknown species, if species they be called, *Schoerleri* and *Leeana*.

None of these are found on the Amazon this side of Manaós, which city is situated on the river Negro just above its junction with the Amazon, about one thousand miles from Para, and, as far as our knowledge goes, no *Cattleyas* have been found above Tabatinga, the frontier fortress on the Amazon between Brazil and Peru. They are also, except *Cattleya luteola* (and perhaps *superba*), confined wholly to the northern bank of the Amazon.

The *Cattleya* region thus seems to comprise a tract of about eight hundred miles on the northerly bank of the Amazon, extending northerly to Guiana, Venezuela and Colombia. The whole of this region for many miles north of the Amazon is of the same general character; *varzea* or land overflowed in the annual rise of the rivers, with stretches or isolated portions of higher land known as *terra preta*. There are innumerable lakes, many of great size, countless *igarapes* and *parana-meris* or water courses which connect the various rivers, but never any high hills or great elevations until far north near the boundaries of Brazil. The greater part of the soil is alluvial, though

there are sandy plains and rocky formations. No road or path of any kind exists in the whole of this immense extent of territory and the only communication is by way of the water.

The evaporation is very great and in the woods the air is generally surcharged with moisture. The rainy season begins in December and continues until June, the rain at times falling continuously in a deluge. During the remainder of the year there is but little rain, but the air at night is always damp from the great condensation. The days are hot, the mercury often rising to 80° or 90° in the shade, and the nights cool, often cold, the thermometer sometimes falling to 55°. The annual rise of the rivers, as shown by marks on the trees, is from twenty to thirty feet.

It is under these conditions of temperature that the Amazonian *Cattleyas* grow. It must be remembered that *Cattleyas* are never found in the close, dark woods and never in pestilential localities. Orchids like a free circulation of pure air, and the *Cattleyas* often grow on the topmost branches of the immense trees in the full sunlight. They also never seek to cover or bury their roots, which run up and down the branches often to the length of fifteen feet, but always on the surface clinging close to the bark, but in large clumps the roots often wind round and round the dead roots and pseudo-bulbs of past years and make large masses, but these inner roots are all dead and these masses become the habitation of fire ants, a fact which does not add to the pleasures of Orchid collecting.

The *Cattleyas* thus experience a season of six months of constant moisture followed by six months of intense heat by day, during which they become very dry, but are every night refreshed by the copious condensation; the maximum and minimum of temperature in the shade being about 80°, rising to 120° in the sun, and about 55° at night. The nearer we approach these conditions in cultivation the nearer we shall be to success.

CATTLEYA SUPERBA.

This species has the most extensive distribution of any Amazonian *Cattleya*. It first occurs on the Amazon in the vicinity of Serpa a few miles below Manaós, and we have plants from many localities nearly to the Peruvian boundary of Brazil. Northerly it extends into Guiana and countries bounding on the Spanish Main.

In habit the plants vary much, the pseudo-bulbs of some being short and club-shaped, of others very long and thin, much resembling those of *Cattleya amethystina*. The foliage also varies greatly from thick, dark, almost round, coriaceous leaves, to long, thin and light-green. The pseudo-bulbs bear two, rarely three, leaves, but the third leaf is at the expense of the flower, for such plants only bloom when they are very strong, but we have noticed that the flowers of all such are exceptionally dark in color. The flowers vary greatly in size and depth of color, but all are good. They generally measure four to five inches in diameter; the sepals and petals are of equal size, varying much in intensity of the deep rose-color, the lip varies from crimson to purple and is more or less marked with yellow veins, the

base being white. The number of flowers on the spike is 1-2-3-5-7-or 9. In thousands of plants we never but once found four on a spike, and never six or eight.

The home of this species is in the trees of the *varzea* or flooded land, on the margins of the many lakes where there is constant moisture in the air, and generally where the plants have plenty of air, and free exposure to light and sun. It blooms from the young growth and requires very little rest, the new growth pushing as soon as the roots of the old growth are mature, and every growth gives a spike of bloom. With us it flowers every three months, and there is not a day in the year when we have not *Cattleya superba* in bloom. The chief bloom, however, is from December to May. The flowers last from two to three weeks in perfection and are deliciously fragrant.

If the pseudo-bulbs of this species are allowed to shrivel they rarely recover, and it takes years to re-establish the plants. It is not an easy species to transport, as it loses its leaves in the cases and the plants are thus much weakened.

Formerly this species was very plenty in the immediate vicinity of Manaós. On the *varzea* land opposite the city between the Rio Negro and the Amazon, there is a lake where, a few years ago, the trees in the season of its bloom were a mass of rich purple from the abundance of this plant; now hardly a plant can be found there, owing to the rapacity of collectors. We have seen in Manaós ox-carts full of *Cattleya superba* begging a purchaser at any price, but now very few are found near the city. From the immense extent of territory over which this species is distributed there is no danger of its becoming extinct, but every year it is more difficult to procure, and will command a higher price.

CATTLEYA SUPERBA SPLENDENS.

This variety is one of the most magnificent of *Cattleyas*. In general appearance the plants do not differ from the species, except that we have never seen one with a very long pseudo-bulb or thin leaf. Its habitat, mode of growth and time of flowering are all the same as those of the species. The difference lies wholly in the flowers. These are of great substance, very large, four to six inches in diameter; the petals and sepals are very deep rose, sometimes approaching purple, and expand perfectly flat; the lip is larger than in the species and of richer color; the yellow veins are very broad and bright and sometimes extend to the edge of the lip. The fragrance is far richer than in the species and the flowers last longer in perfection. We have never seen more than five flowers on a spike. The true variety is very rare; one may receive a hundred of the species and not find more than one or two of this variety. As far as our observation has extended, and we have given much attention to this subject, there is no locality where it abounds, but here and there plants are found over the whole habitat of the species.

CATTLEYA SCHOERDERI AND CATTLEYA LEEANUM.

Of these two, so-called species, we can give little positive information. They are said to be natural hybrids between *Cattleyas superba* and *El Dorado*, the former partak-

ing more of the nature of *superba*, the latter more resembling *El Dorado*. We have plants which have been pronounced *Cattleya Schoederi*, but to us they seem only *Cattleya superba* with exceptionally thick foliage and pseudo-bulbs, and there seems no reason for elevating the plant to the dignity of a species. The flowers are only a large, light-colored *Cattleya superba*.

Since these two species were taken to England by a collector of the Messrs. Low, several collectors have been up the Amazon in search of them but have returned unsuccessful. There seems no reason why such natural hybrids should not exist, but until we have more evidence we prefer to consider the matter as questionable.

CATTELEYA LUTEOLA.

This plant, long known and with many synonyms and rare in cultivation, though not showy, is one of the most charming of Cattleyas. It is of dwarf, compact growth, the pseudo-bulb and single leaf seldom exceeding six inches in height; but though individual plants are small it can sometimes be found in great flat masses. We remember some years since, when living on the Middle Amazon, having a plant brought us as large as an immense door mat; it had been peeled off the trunk of a great tree like a sheet of moss. It was a puzzle what to do with such a plant, but finally we nailed it on to the back door of the house where it had shade and free air, and for months it was bright with its pretty yellow flowers.

The leaves are single, very dark-green and coriaceous; the flowers are produced on short peduncles and vary in number from one to eleven. The sepals and petals are of a rich primrose-yellow; the lip of the same color or veined more or less with deep red. The flowers measure two to two and a half inches in diameter and have a faint but not very agreeable perfume; they last in perfection many weeks.

This species is a most profuse bloomer, every pseudo-bulb giving flowers. Often the flower spathe will dry and give no flower at the usual season of bloom, but sooner or later the flower spike will come, thus much prolonging the blooming season if one has many plants. It blooms from December to April.

Cattleya luteola is found only on that part of the Amazon known as the Solimoes, being the five hundred miles between Manaos and Tefé; it does not occur on the river Negro. It is a native of the *varzea* lands of both banks of the Solimoes, but, unlike *Cattleya superba*, it loves the shade and is found deeper in the woods, frequently on the trunks of the trees, but never in the dark swamps. It is of the easiest culture and is a very bright, attractive plant.

CATTELEYA EL DORADO.

This beautiful species comes from the river Negro. For richness and delicacy of color, beauty of form and exquisite fragrance, as well as for duration of flower, it leaves nothing to be desired. The varieties are innumerable, in fact scarce any two plants are alike in flower, and one may have as many varieties as he has plants.

The pseudo-bulbs are either long or club-shaped; the leaves one, rarely two, broad, dark-green and coriaceous; the length of pseudo-bulb and leaf varies from nine to

twelve inches. The flower is produced from the young growth which, after blooming, sends out roots and matures the bulb. The plant then rests for some months when is from December to April. This species naturally grows and blooms at the beginning of the rainy season and rests during the dry, and even in Para where the air is always moist and the monthly rain fall heavy, they refuse to bloom at any other season.

In the type the flowers are rosy-white, the sepals generally narrower than the petals, the flower not expanding flat, the lip white or rosy, often tipped with purple and with a large yellow or orange blotch on the throat; the fragrance is that of *Narcissus poeticus*. Flowers one to seven on the spike, measuring four to five inches in diameter. In varieties the sepals and petals vary to very deep rose, the lip may be rose or very heavily tipped with purple of every shade; the blotch on the lip varies greatly in size and in color, from pale yellow to intense orange; the lip itself varies much in size and expansion.

CATTELEYA EL DORADO ALBA.

This variety resembles in growth the species and is found with both long and club-shaped pseudo-bulbs; when out of flower it is undistinguishable. Flowers one to four on the spike, measuring five to six inches in diameter; sepals usually much narrower than the petals, both pure lustrous white. Lip pure white with deep orange blotch tipped with deep purple and fringed. It differs from *Cattleya Wallisii* in having narrower sepals, a smaller flower, having purple on the lip and being of far larger habit. Blooms at the same time as the species. It seems to have no special habitat, but is found growing in the same localities as the species. In a hundred plants of *El Dorado* perhaps ten may prove to be of this variety.

CATTELEYA EL DORADO SPLENDENS.

This magnificent and rare variety differs from the species in being of stronger growth and usually has club-shaped pseudo-bulbs; the foliage is very thick and dark-green. The flowers, which are of great substance, measure six to seven inches in diameter. Petals very broad with sepals nearly of equal size, both clear rose; lip rosy, fringed, with deep orange throat, which color sometimes extends to the lip; petals, sepals and lip often tipped with rich purple, but in this the plants vary much. Flowers one to six on the spike, often lasting a month in perfection. Found in same localities as the species. In a hundred plants of *El Dorado* as taken from the woods one is fortunate if he finds two of this variety.

CATTELEYA WALLISII.

Plant far smaller in all its parts than *Cattleya El Dorado*; the pseudo-bulb is usually very short and club-shaped, but the plants vary much in this respect. Leaf rather long and narrow. Flowers one to three on the spike expanding six inches in diameter; sepals and petals almost equal, very broad; lip not fringed, pure white with intense orange throat; rarely the whole lip is deep orange with only a narrow edge of pure white; sepals and petals pure white.

This species is the most beautiful and rarest of the Amazonian Cattleyas, and the true species is very rarely met with. It is a

native of the river Negro, usually on the higher land which even in extraordinary rises of the river is not overflowed, though we have met with it in the same localities as *Cattleya El Dorado*.

This species even in Para brings a very high price and we know of only a very few plants. The blooming season of this species and of all the varieties of *El Dorado* is from December to April, and in mode of growth they all resemble that species.

EDWARD S. RAND JR.

PARA, BRAZIL.

GARDENS NEAR LONDON.

After a few enjoyable rambles around London among good gardens, writes a correspondent of the London Garden I am pleased to see how the light is spreading, and how rich and tasteful the gardens of to-day have become. It is especially satisfying to see the deep and earnest interest now being taken in the finer phases of flower gardening, as at Wisley, Golder's Hill, or at Bickley, and more especially in the wider grasp which ladies particularly, and amateurs generally, are taking of the hardy flower question. The old twiddly-twirly bedding arrangement is being supplanted by a little of breadth and repose, and here and there one may find real culture in the garden. The wild gardens at Wisley and Miss Jekyll's dainty pleasance at Munstead are far before the sacred carpet bedding of our time.

Our garden flora was never so rich nor so varied as now; and although we have as yet much to learn, much has already been done. I am almost ashamed to say it, but one must needs speak out the bitter truth, that all this advance is due to the taste and enterprise of amateurs rather than to the exertions of their gardeners. Even although the prophet has been amongst us these twenty years or more, there are not ten gardeners in a hundred who know even the A B C of hardy flowers and their proper cultivation.

BANANA CULTURE IN HONDURAS.

Honduras is rapidly assuming importance among the larger countries in Central America. According to the Commercial Advertiser, it has increased fifty per cent. in population in the last ten years. The lands outside of the main towns are being bought from the government by citizens of the United States and by Germans. The object of these new settlers is to establish Banana plantations. The soil of Central America is peculiarly adapted to the growth of this fruit, which can be raised at what would seem to be a ridiculous expense. The market for Bananas in New York is good, and the sale of them pays a profit of about twenty per cent. The purchase of these lands has netted the government about \$1,500,000 during the last year, and as it owns about 1,000,000 of acres, there is a fair prospect of its enriching itself within the ensuing five years.

Dulcias, especially the single varieties, are easily grown from seed sown in light, rich soil in a gentle hot-bed. When the young plants are about two inches high transplant singly into small pots, keep in a cold frame, harden them off gradually, and transplant to the open ground towards the end of May.

The vigilant man watcheth for young weeds to destroy them, even as a Herod for young children.

Exhibitions & Societies.

AMERICAN INSTITUTE FARMERS' CLUB, PEACH CULTURE.

The meetings of this Club, which are held every 2d and 4th Tuesday afternoon of each month at the Cooper Union, New York, are always interesting and enjoyable. At a recent meeting Mr. J. T. Lovett of Little Silver, N. J., read the following paper, which is so full of solid, practical information, and at the same time, given in so condensed a form, that we print it in full:

So many owners of farms in the vicinity of New York are endeavoring to learn to what purpose their land may be devoted so as to yield profitable returns, it is quite surprising that so few engage in Peach culture. First, because the returns from a successful Peach orchard are so great; secondly, because a Peach farm can be managed so easily by the owner, who is perhaps engaged in other pursuits in the city; requiring very little attention or looking after by him except during the shipping season, when the orchard has arrived at bearing age. Should the owner of a garden plant twelve Peach-trees each season, of good varieties, and give them the simple culture required, he and his family could revel in Peaches for a season of three months.

SOIL.

The Peach is a native of Persia, hence it is obvious that it requires a warm soil; in fact, it will be useless to plant Peach-trees upon soil where the water stands near or upon the surface. If not well drained naturally it must be drained artificially. The best soil for Peaches is a sandy loam, not highly charged with vegetable matter.

PLANTING.

In planting Peach-trees, early spring is much the best season, although they can be planted in the autumn with success, providing proper care is observed, viz.: that the roots do not become frozen before they are placed in the soil, and a mound of earth about a foot in height placed at the base of each tree to prevent swaying. Plant no deeper than the trees stood in the nursery and make the soil very firm. The distance to plant depends somewhat upon the character of the soil. On a light, sandy, porous soil a distance of fifteen feet each way will be far enough; while on the other hand, should the soil be sandy loam or quite loamy, eighteen or twenty feet apart each way will be none too far. I usually plant eighteen feet apart each way, requiring one hundred and thirty-four trees per acre.

PRUNING.

Perhaps no other fruit-tree suffers so much from neglect of pruning, both at the time of planting and in after years, as the Peach. This is owing not only to the fact that the Peach requires annual pruning—more than almost any other fruit-bearing tree—but also because no other fruit-tree receives so little or is so often neglected.

In planting, all side branches should be cut back to within a few inches of the main stem—the main stem being severed at about two-thirds of the distance from the ground. Small trees should be pruned to a whip, cutting back the stem very nearly one-half the way to the ground. In order to produce what is known as the bush form—a system followed by many successful Peach growers—sever the main stem from twelve to eighteen inches from the ground, causing many shoots to be produced near the earth. Subsequent pruning consists of an annual cutting back of the main branches, forming a symmetrical contour, and a judicious thinning of the branches.

CULTURE.

Nothing can be more simple than the culture required by the Peach. It is simply to keep the surface always mellow and free of weeds. In other words, it needs only the culture that one would give Corn. For the first two years after planting, hoed crops may be planted between the trees with advantage; after which time they require the entire strength of the soil. Grain crops of all kinds are very injurious, and it is rare that Peaches will succeed in sod or grass. In making the annual plowing in spring, it is well to use a light plow, plowing very shallow, that the roots may not be mutilated or disturbed. In keeping the surface mellow and free of weeds, I have found nothing so admirable and rapid in performing the work as the Aeme Harrow; although any implement that will produce the desired result can of course be used.

FERTILIZERS.

As is well known the Peach is a heavy feeder of potash, hence potash should be supplied in some form. I prefer unleached or live wood ashes for this purpose to anything else, provided they can be had at a satisfactory figure, namely, 30 to 35 cents per bushel, delivered. I have also employed muriate of potash with good results. I prefer to apply broadcast always in spring, and harrow in. The Peach also demands a liberal supply of phosphoric acid. This is to be obtained in its best and cheapest form in pure ground bone, or at least I have always had good success from using this fertilizer. I do not recommend using stable manure for the Peach, the tendency being to produce an undue leafy growth, rendering the trees unproductive and more susceptible to injury in winter.

ENEMIES AND DRAWBACKS.

The chief enemies of the Peach are the grub or borer, and that terrible scourge, the yellows. The former is easily overcome. All that is necessary is to examine the bodies of the trees early in the spring and extract the grubs with a sharp-pointed blade of a knife. They will be found just beneath the surface of the soil, and their presence will be readily detected by the gum formed from the exuding sap. As a preventive of the borer, place at the base of each tree a shovelful of slacked lime or several of coal ashes.

The yellows, which has proved so disastrous to Peach culture in many parts of the country, has recently been, I think, conclusively demonstrated by Prof. Burrell and Prof. Goessmann to be the result of a fungus, and since the disease—if such it can be termed—is understood, I think we can handle it successfully. Many trees supposed to

have the yellows are not in reality affected with the disease, their sickly appearance being the result of improper nourishment in the form of potash and phosphoric acid. I have known trees that were affected with the yellows in reality which were restored, not only to vigor but also to fruitfulness, by a liberal application of muriate of potash and severe pruning. These are the only remedies that I have to offer, and I am thoroughly convinced they are the only ones necessary to battle with this dire enemy.

The great drawback to Peach culture in the vicinity of this city and northward, however, is the killing of the buds in winter. As many are aware, prior to the winter of 1881-82, Peach buds were not injured to any extent throughout the Hudson River district and southward for a period of at least ten years; but since then they have been injured to a greater or less extent each winter. But this is no reason why they should be injured in the future. Were it not for this one risk Peaches would soon be grown so largely that the producers of even the finest crops would not find them profitable. We must take the risk to secure the gain.

VARIETIES.

In planting for market a great mistake is often committed by selecting an extended list of varieties. The varieties of Peaches for profit that can be counted on the fingers of one hand, are worth more than all the others combined; further, in marketing it is necessary to have a number ripening at one time, that they may be gathered and shipped economically. With the amateur planter the case is different. He may consider it desirable to have a number of sorts, both to extend the season to its full limits, and also for the sake of variety.

Were I confined to a single variety it would be that grand old sort Oldmixon Free, often termed "Old Reliable." As the three best varieties, all things considered, I would name Mountain Rose, Oldmixon Free and Crawford's Late, ripening in the order named. Were I to add two others they would be Amsden's June, or Alexander's Early, ripening in advance of the preceding, and Stephen's Rareripec—succeeding them all. As the best and most profitable entirely white Peach I would name Keyport White. The best of all clingstones is that large and beautiful sort, Heath Cling, especially valuable for making "Brandy Peaches."

There are many other desirable and profitable varieties, such as Beers' Smock and Billeu's October—both of which ripen very late; Crawford's Early and Foster—two large and beautiful yellow flesh varieties, ripening in midseason; Mrs. Brett and Lord Palmerston, perhaps the most beautiful of all Peaches and as delicious as they are handsome; Stump the World, ripening immediately after Oldmixon Free and very similar to it in all respects; Ward's Late Free, also similar to the Oldmixon Free in a general sense, but ripening a month later. For canning, the yellow-fleshed Peaches are preferable, among the best of which may be named Crawford's Early, Crawford's Late and Beers' Smock, ripening in the order named. Especially hardy varieties—that pass the winters with most impunity—are Crawford's Early, Jacques' Rareripec, Hill's Chili or Jennie Lind, Stephen's Rareripec, Mrs. Brett and Pratt.

MASSACHUSETTS HORTICULTURAL SOCIETY.
Special correspondence of THE AMERICAN GARDEN.

The Spring Exhibition of the Massachusetts Horticultural Society, which opened March 19th, and continued until Friday the 20th, was without question the best ever held in Boston, and in fact in no other part of the country has such a varied and rare lot of spring flowers been gathered together in one hall for exhibition.

Outside, the temperature was continuously below freezing, and had it not been for this fact, the hall would have failed to hold all the exhibits which were promised. About ten thousand persons visited the show, and the crowd was so great that on several occasions admission was denied to those in waiting until the hall could be cleared.

At the entrance of the hall was a stand of forced Roses and Azaleas from Mrs. Francis B. Hayes, the central specimen being *Rhododendron Veitchianum levigatum*, with great, fragrant flowers of the purest white. Among the Roses was a fine plant of Paul Neron, with flowers of extraordinary size.

Next to this stand was a low platform fifty-five feet long and six feet wide, with an elevated center devoted mainly to spring-flowering bulbs, the display of which was far superior to any ever made before, and next to the Orchids constituted the glory of the show. Hyacinths, Tulips, Narcissi, Jonquils, Crocuses, *Anemone coronaria*, Lilies of the Valley, were shown in the finest specimens of the newest varieties, and in bewildering profusion, like the most brilliant bed in the flower garden filled with the choicest selection of plants. Besides the bulbs there were graceful and delicate wreaths, fragrant Violets in pots, Primulae and Pansies on the plants, far more attractive than the cut-flowers in flat dishes.

The most notable Narcissus was the new "Sir Watkin," a gigantic form of *incomparabilis*. This and *Poeticus ornatus* attracted much attention, together with the "Tenby Daffodil" or *N. obtularis*. The latter is a compact and beautiful Narcissus. All were shown by Edw. L. Beard, who also had a collection of Cyclamens, the finest type ever shown, of compact habit, brilliant colors, and bearing immense flowers. On this center platform were grouped not less than a thousand pots of every conceivable form of spring flower, forming a sight to be long remembered when once seen.

At the end of the hall, grouped upon the platform with a backing of tall Palms, Ferns, etc., were the Orchid collections, embracing about one hundred plants, many of them unique specimens. F. L. Ames of No. Easton exhibited *Dendrobium Ainsworthii*, with over 150 flowers; *Phalænopsis Brymerianum*; *P. Stuartiana*; *Calliopsis Amelthystoglossa*; *Dendrobium Brymerianum*; several magnificent plants of *Odontoglossum Alesandriae* and *Pescatorei*, one of the latter bearing sixty flowers on one spike; *Dendrobium Wardianum album*, besides several huge plants of the type; *Odontoglossum triamphans*, with an unequalled spike of bloom, and many others of rare quality and large size. H. H. Hunnewell exhibited a plant of *Coelogyne cristata*, *Chatsworth var.*, three feet across and a sheet of flowers; *Phalænopsis Schilleriana*, several extra good varieties of this being

shown, one plant with about 75 flowers open; *Cymbidium Lowi*; *Odontoglossum Inseparabile*; *Calanthe Turneri*; a fine plant of *Dendrobium Wardianum*; *Sophronites grandiflora*; besides numbers of others. David Allen, gardener to R. M. Pratt, exhibited about a dozen grand plants of *Dendrobium Wardianum*, most of them bearing from 40 to 60 flowers. He also staged a plant of *Dendrobium Ainsworthii* well-bloomed, and one of the finest plants of *Cypripedium insigne* ever put on exhibition. It was about four feet across. The Orchids were interspersed with Ferns and brilliant Anthuriums, constituting a display rarely seen.

A gratifying feature of the exhibition was the award of the Society's Silver Medal to F. L. Harris, gardener to H. H. Hunnewell, David Allen, and W. A. Robinson, gardener to F. L. Ames, for Skilful Culture of Orchids.

The Botanic Garden at Cambridge through W. A. Manda, its gardener, exhibited forced herbaceous plants, including *Lilium tenuifolium*, *Primula Cortusoides*, *Trillium grandiflorum* and *Doronicum Caucasianum*, the latter very bright and showy.

Jackson Dawson of the Arnold Arboretum showed fine and well-bloomed plants of Hybrid Perpetual Roses on the Japanese stock and an interesting collection of hardy Primulas and Polyanthi in pots, besides forced *Kalmia latifolia*.

Jno. B. Moore took the first prize for 24 cut blooms of Hybrid Perpetual Roses, which were even finer than his magnificent June flowers, which for three years have taken the challenge vase. A magnificent bloom of white Baroness took the first prize for single blooms. This promises to be a finer Rose than Merveille de Lyon.

The Pansies in pots and also cut blooms from Denys Zirngel attracted much attention, the strain being one of the best in the country. Cut Carnations were handsomely shown, J. A. Foster having a fine lot including seedlings, shown naturally with their foliage. Tea Roses and Hybrid Perpetual Roses were staged in great profusion, Delay and Meade taking a number of prizes for tender varieties.

The major portion of the prizes for Hyacinths were taken by C. M. Hovey, C. H. Hovey & Co., and Jno. L. Gardner. The latter represented by that veteran, C. M. Atkinson, took first prize for 12 with the following:—La tour d'Auvergne, Laurens Koster, Princess Dagmar, Obelisque, Sir Jno. Laurence, Snow Ball, Chas. Dickens, Alba maxima, Argus, L'incomparable, La Grandesse, Czar Peter. The first prize for six Hyacinths was first awarded to E. L. Beard, who was subsequently disqualified on account of duplicates, and then awarded to C. M. Hovey. The best single spike was Czar Peter, shown by C. H. Hovey & Co. The first prize for the best display of hardy Narcissi was given to E. L. Beard, and the three prizes for best general display of spring bulbs went respectively to C. M. Hovey, C. H. Hovey & Co., and E. L. Beard.

Last but not least were the Azaleas, where the veteran Marshall P. Wilder and Arthur W. Blake, a new contributor, divided the honors, Mr. Wilder filling a platform with fine, large old specimens, and Mr. Blake contributing a collection of young plants of the newest varieties, among which La Flun-

beau was of most intense color. Had it not been for the intense cold, the display in this class would have been grand.

Mr. Moore exhibited a plant of the new Hybrid Perpetual Rose, Col. Felix Breton. This is the darkest Rose ever shown of good habit, promising well for freedom of bloom and very fragrant. It was awarded a certificate of merit.

These exhibitions have grown so, both as to the number of visitors and exhibitors, that the society finds its facilities severely taxed. An indication of this may be noted from the fact that more people visited the Spring Exhibition this year, than during the entire five years previous to 1883, with exception of the year when the American Pomological Society held its session here.

E. L. BEARD.

NEW ORLEANS MEETING OF THE AMERICAN HORTICULTURAL SOCIETY.

Mindful of my promise to send a report of this meeting, for THE AMERICAN GARDEN, I must beg pardon for the delay. I have had so much to do and see, and being on the wing so much of the time, I have not been able to get at my notes and write them out. With this preface I get to business.

From the scope of territory embraced in the membership of the society, and the topics and subjects treated, it was deemed advisable to change its name and give it a more expressive character. It will therefore be known hereafter as

THE AMERICAN HORTICULTURAL SOCIETY.

It was thought by some present that this action might be construed as aiming to supersede the mission of the American Pomological Society, but from what I could learn from those who are members of both organizations, such an idea has no existence in their minds, and they repudiate as unjust any insinuations of the kind. The field is broad and the harvest abundant for both organizations, and they hope to work together, hand in hand, strengthening and encouraging each other.

The meetings continued eight days, and the subjects treated, together with the wide area of territory embracing the homes of the members, show conclusively the propriety of adopting a more significant and comprehensive name than the "Mississippi Valley."

The following programme as carried out will show the variety of subjects treated and the area of territory levied on.

Fraternity in Horticulture, Mo.; Association in Horticulture, Mich.; Our Native Grapes, Ohio; Landscape Improvement of Country Houses, Ohio; Cross Fertilization, Tenn.; Success and Failure, Wis.; Our Popular Fruits, N. J.; Hybridizing and Crossing, N. J.; Pruning and Training the Vine, N. J.; Fungoid Diseases of the Strawberry, Ills.; Horticulture in Civilization, Miss.; The Native Grapes of the U. S., Tex.; Nomenclature of Russian Fruits, P. of Q.; Insect Notes of Interest to Fruit-growers, D. C.; Strawberry Culture, Conn.; The Indigenous Potatoes of America, Cal.; Tropical Horticulture, Jamaica.

These were all treated by the authors in person, and several other papers remained in the hands of the secretary and will doubtless appear in the forthcoming report. From the above it would seem there were abundant reasons for the change; whether it

wise one or not time will show. And right here let me say to the readers of THE AMERICAN GARDEN, that a remittance of \$2 to W. H. Ragan, Secretary, Greencastle, Ind., will secure the report when published and in addition a copy of the last report, a volume of nearly 300 pages, fully worth the entire investment. Promptness in this matter will not only determine the size of the forthcoming edition, but the fullness and value of it, and who would not desire and appreciate so valuable and permanent a souvenir of the greatest exhibition the world has ever seen? It will possess a permanent interest and value for all horticulturists in this country.

I could not convey to the reader any adequate idea of the value or contents of these papers and the discussions, were I to attempt it, neither would your columns admit of so doing. No mere synopsis could do the subjects or their authors justice, nothing short of the full text will have a satisfying effect.

In all my experience with meetings of this kind held in connection with exhibitions, the inducements for attendance by the latter have always operated detrimentally to the former to some extent, and this occasion was no exception. Everyone in attendance on occasions of this kind must see the exhibition and then compare and discuss the merits or demerits of the different exhibits and samples before them.

There is also always more or less committee work to do, and this always draws perceptibly on the members, thus causing enforced absence in one ease and voluntary absence in the other. Added to these difficulties, is often unsuitable and noisy places for the meetings, rendering hearing difficult. This meeting was no exception. The frequent tramping on the bare floors of the corridor and the constant hammering of the mechanics and laborers in preparing and mounting the exhibits adjacent to the room of meeting, together with the frequent chiming of the bells, rendered hearing absolutely out of the question a few feet from the speaker. After a committee failed to find better quarters, and appeals to the professor of elime music met deaf ears, the President mastered the situation by inviting to and offering the use of his parlors for future meetings. This proved to be a happy solution of the difficulty, and other societies similarly afflicted are cordially invited to apply the same remedy. I have great faith in its efficacy, and the warm, social feeling that will follow will by no means be the least advantage attending the results.

At one of the sessions the death of our dear old friend and co-laborer Chas. Downing was announced, and the society took immediate steps to put on record their estimate of his life and services by the adoption of suitable resolutions.

The claims of several places for the next meeting of the society were duly presented and discussed, the matter being finally left to the executive committee.

The officers elect for the ensuing year are Parker Earle, Cobden, Ill., President; T. V. Munson, Dennison, Tex., 1st Vice President; W. H. Ragan, Greencastle, Ind., Secretary; J. C. Evans, Harlem, Mo., Treasurer; with Vice Presidents from each State and Territory.

E. WILLIAMS.

Miscellaneous.

The care of roses brings roses to the cheeks.

EASTER FLOWERS.

There is no time during the year when flowers are in such extraordinary demand, and the ingenuity of florists is so taxed, as at Easter tide, when the most refined and beautiful of God's creations are sought to express the highest and holiest sentiments. The fairest flowers are forced for the Easter celebration, which takes place at a season when Nature so generously assists the plantsman that the perfection of growth is obtained.

With marked accuracy skilled growers are able to time their plants to bring in a superb crop of bloom at Easter. White flowers are in the largest demand, although this season there has been an innovation to the usual rule, and rich effects have been wrought by the introduction of red Roses on the altars, and in memorial designs, that heretofore have always been decorated with pure white blossoms.

The admirable and interesting class of dusky Roses, some of which are nearly black, so deep is their crimson, cannot be successfully developed before Easter. They will not get the color desired if forced too rapidly. This year they are one of the loveliest features of the Easter flower market, and the cream of the superb Rose crop. La Rosarie has a larger flower than General Jacqueminot and is a shade deeper in color; Abel Carrière is dusky, velvety, and has a fiery heart; Xavier Olibo is almost black, and Eugene Appert is very deep in color, and its petals are like plush; Jean Liabaud is a glowing crimson; Louis Van Houtte and Prince Camille de Rohan are both very dark, and Senateur Vaisse is large and dusky. Of all these deep-colored Roses, Foutenelle is considered the richest; when on the bush it seems to fairly vibrate.

"I plucked the flower and held it to my ear,
And thought within its fervid breast to hear
A smothered heart beat, throbbing soft and low."

AMARYLLIS AND ASPARAGUS TENUISSIMUS.

Besides the dark Roses, Amaryllis with their gorgeously pencilled throats have been used among the plants on the altars. *Passiflora rubra* with its crimson flowers was especially suitable for Easter decoration, and was most gracefully festooned around memorial windows.

Lapageria rubra was also employed in decorations and was very elegant combined with *Asparagus tenuissimus*. The latter vine is now grown in lengths to make it useful for large decorations: it bestows a lovely laciness wherever it is twined: mounds of it are made over wire frames, which are charming pedestals for specimen plants.

ALMONDS, AZALEAS, MARGUERITES.

Flowering Almond with its spicy scent was introduced into several of the large Easter altar designs. Massings of Azaleas which have a transparent and tremulous appearance that makes them exquisite when clustered, were used in profusion. *Astilbe Japonica*, bushes of *Marguerites*, and fine

plants of *Deutzia gracilis* and *Erica gracilis alba* were among the galaxy of bloom that greeted the eye Easter morning.

EASTER LILIES.

The Easter Lily crop was a handsome one. There were *Lilium longiflorum*, *L. Harristi*, *L. candidum*, and *Callas*, all of which were brought to the shops hooded with cotton batting to keep their cups fair. The plants sold at various prices, about 50 cents for each flower being charged. Besides providing for church decorations, a great number of institutions and private parties had to be supplied, for everyone wants Lilies at Easter.

Lilies of the Valley were in enormous requisition for gifts. The loveliest baskets of these, combined with Snow Drops and clusters of white Forget-me-nots, were ordered for tokens of remembrance.

STOCKS, HYDRANGEAS.

White Stock Gillies are forced in great perfection this spring, and were very handsome placed among the rich tinted Wall-flowers, which were brought in to swell the Easter display.

Hydrangeas were among the handsomest specimens in blooming plants. *H. Otaksa*, *H. Hortensia* and *H. Hoggii* with their grand panicles, were conspicuously elegant, both in the churches and in decorations for private entertainments.

DINNER-TABLE DECORATIONS.

A large number of Easter Sunday dinner-parties were given, when the display of flowers on the table was beautiful and suggestive. A bed of Lily of the Valley would be placed in the center, and surrounding this would be Callas with their spathes filled with long stem Bon-Silene buds. At each plate a bird's nest containing confectionary eggs stood on a cluster of Lily of the Valley blossom spikes.

The prevailing style of dinner-table decoration this month is to place long stem Roses in silver dishes, or buds in the center, and to scatter Roses loosely around, to be taken by guests after the repast is finished. It is pleasurable to help one's self to the beautiful feast of Roses.

EASTER SOUVENIRS.

The boxes of cut-flowers sent for souvenirs Easter morning were marvelously lovely. Some of these contained only Violets, the clusters being laid so as to show the different shades, from the deep purple Czar to the pale Neapolitan, and then followed the tiny cluster of pink Violets, and below this, those white beauties of which the finest is the Swanly White. The latter has been very popular, one florist having sold over 2000 a week all through the season of two months' duration.

In every box was the hint of Easter in a spray of Lilies in one corner. There were boxes of Roses among Maiden Hair Ferns, and there were large clusters of kaleidoscopic Pansies ("For thoughts") which were fringed with Lilies of the Valley. "Blue boxes" were a feature among Easter floral gifts. These contained blue Daisies, Violets, Larkspur, Passion Flowers (*Passiflora incarnata*), Forget-me-nots, and Bluets.

STRAW BASKETS.

Since the introduction of colored straw baskets, "pink," "blue," and "yellow" favors have been fashionable for presents. Pink baskets are filled with Clover blossoms,

Polyantha "Mignonette" Roses, and Sweet Pea, on one side, and a large cluster of Gabriel Luizet Roses on the other. The yellow baskets contain Daffodils, *Acacia pubescens* and Maréchal Niel Roses.

Bleeding Heart, *Dielytra spectabilis*, was flowered extensively for Easter decorations, as was the old-fashioned Lemon Lily, *Hemerocallis flava*, with its trumpet form and delightful fragrance.

WILD FLOWERS.

Notwithstanding the magnificent yield in Hybrid Roses and spring flowers, there is a yearning among flower-lovers for wild bloom. Buttercups and Dandelions have been forced, but there are not enough to supply a tithe of the demand. Arbutus and Swamp Cowslips are impatiently awaited, as are the fruit blossoms and early flowering shrubs. These are brought to the flower stores as soon as they appear, and are readily disposed of.

Buffalo horns highly polished are the flower-holders of latest introduction: these are swung up by chains, and will hold a vial of water in which to place flower stems, or may be filled with soil and planted with vines. They can be arranged with graceful effect on chandeliers, or on center lights over the table.

FLORA.

ANSWERS TO CORRESPONDENTS.

Propagating *Daphne odorata*. Mrs. C. B. E., *Palmyra, N. Y.*—This plant is easily propagated from half-ripened wood in spring. See notes on Cuttings in Window Garden Department.

Book on Roses. E. O. A., *Ind.*—Rivers' work on Roses is out of print and would be difficult to obtain. H. B. Ellwanger's "The Rose," is the latest and decidedly best work on the Rose, especially for the American Rose-grower.

Hardiness of Peaches. *Amateur, Chicago.*—Peaches cannot be grown successfully where the thermometer falls every year lower than 12° below zero; this degree of cold kills the buds, so that the trees cannot bear fruit the following season. Forty degrees below zero would kill the entire tree.

Hyacinths and Ranunculus. J. G., *Philadelphia.*—To promote the rising of the flower stalks of Hyacinths above the leaves, florists cover the plants lightly with sheets of paper. The usual season for potting Ranunculus is in October or November, but as the roots, if kept dry, retain their vitality for two or three years, they may be planted at any time. They require a rich, rather stiff soil, and must never be allowed to become too dry.

Tuberose. Mrs. F. A. M., *Litchfield, Conn.*—Bulbs that have bloomed will rarely flower again, so that it is not worth while to run the risk. To propagate Tuberose, the small off-sets that form around the bulb are broken off, and planted in rows in rich, light soil, taking them up again before winter, of course. They will bloom the second or third year. Unless these off-sets are broken off when planting the flowering bulbs, these will not bloom well. They may be planted outdoors about the first of June, or started in pots in hot beds about the middle of April.

Horse Radish Culture. E. J. S., *Rockland, Md.*—Horse Radish is extensively grown by market gardeners near large cities. It requires a very rich, deep, rather moist soil, and is raised from sets, that is, thin pieces of root, the trimmings of the previous year's crop, cut into pieces of four to six inches in length. The land should be well worked before planting, which has to be done early in spring. In field culture the sets are planted in rows about three feet apart and eighteen inches in the rows. The planting is done by simply making a hole with a pointed stick, dropping the set so that it is about three inches below the surface, and then pressing it firmly with the foot. During the first month or two the ground has to be kept well cultivated and clear; later the leaves cover the entire ground so as to make cultivation useless or unnecessary.

OUR BOOK TABLE.

New York State Reformatory at Elmira, N. Y. Annual Report of the Board of Managers.

Cattlemen. Proceedings of the First National Convention, held in St. Louis, Mo., Nov. 17th to 22d, 1884.

Facts about Canned Goods. Report of the Canned Goods Committee of the New York Mercantile Exchange.

Montgomery County, Ohio, Horticultural Society. N. Obmer, president; Wm. Ramsay, secretary. Proceedings of the January and February meetings.

How I Made Money at Home, with the Incubator, Bees, Silkworms, Canaries, Chickens, and One Cow: by John's Wife. 82 pages; illustrated. Mailed for 30 cents. Hunter MacCulloch, 1828 Reed Street, Philadelphia, Pa.

Babyhood, New York. A monthly magazine devoted exclusively to the care of infants and young children and the general interests of the nursery, is improving with each number; it ought to be in the hands of every mother.

Potatoes, by Chas. V. Mapes, published by the Mapes Formula Co., 158 Front Street, New York. In this pamphlet the author brings together the results of many recent experiments by himself and others, showing the demand for complete, not partial fertilization, showing the fallacy of the popular belief that commercial or concentrated fertilizers are mere "stimulants." This is a valuable addition to our Potato literature.

Outing. The April issue of this bright and charming monthly indicates the purpose of its publishers to place it in the foremost rank of American magazines. It is enlarged to nearly double its former size, and its compound title is wisely simplified to the expressive *Outing*. A new and tasteful cover and increased illustration of the best sort give it comeliness, and its table of contents is substantial and alluring.

A leading feature of the number is a strong group of letters on the preservation of the Adirondack Forests, by a score of eminent public men.

Good Housekeeping. Messrs. Clark W. Bryan & Co., New York, and Holyoke, Mass., have made two decidedly "taking" periodicals in *The Paper World* and *The Builder*, and now attempt a still more ambitious venture in "Good Housekeeping," a new, illustrated, semi-monthly journal "in the interests of the higher life of the household." A felicitous title, a worthy aim, skilled conductors, able writers, perfect printing; with all these in union, an appreciative public will surely be found. Mr. Bryan has a happy method in journalism which is bringing him merited success in the accomplishment of great good among a wide range of readers in varied fields of action.

The Peanut Plant, its Cultivation and Uses, by B. W. Jones. Published by the Orange Judd Co., New York. Every page of this pamphlet shows that it is written by one who is thoroughly familiar with his subject in all its bearings. The importance of the Peanut crop—already amounting to two millions of bushels annually—is so rapidly increasing that a work of this kind, giving in plain, practical language all the necessary directions for planting, cultivating, harvesting, marketing and much other interesting information, will be welcomed by all those living in the Peanut range, which, according to the author, extends over all the country having a growing season of five months exempt from frost.

A Brief of Horticulture in Michigan, by Chas. W. Garfield, Grand Rapids, Mich., Secretary of the Mich. Horticultural Society. This pamphlet of thirty-five pages forms a valuable and interesting contribution to our pomological literature, giving exact historical and statistical information about one of the most important fruit regions of our continent. From accurate data the author estimates the sales of Apples from Michigan the past season at 5,000,000 bushels, at prices ranging from \$1.50 to \$2.00 per barrel. The area in fruit is estimated at not less than 300,000 acres, and the area is rapidly increasing this year. An excellent map of the State forms the frontispiece, and by commentaries, water privileges, altitude, etc., may readily be observed on descriptions and statistics of the various localities now reared.

Begin to eat rotten apples and they will be all rotten before you get through the barrel.

TRADE NOTES.

ITEMS OF GENERAL INTEREST FROM THE SEED, NURSERY AND FLOWER TRADE ARE SOLICITED.

C. W. Dorr & Co., Des Moines, Ia., have consolidated the firm of Pago & Kelsey.

R. & J. Furquhar & Co. have taken another brother into partnership, a Scotch seed grower of experience.

The new Snowball Mignonette illustrated in the March issue, is put out this year by Henry A. Dreer of Philadelphia.

E. C. Holmes & Co., Boston, have increased their business so rapidly that they have taken a new store at 32 Faneuil Hall Square.

The plant and seed trade generally seems to be large in volume and in number of orders, but the average size is much smaller than last season.

The Mapes Fertilizer Co., New York, have issued two large editions of their very interesting catalogue, and think they will have to issue a third.

Edward Cooper, for many years in charge of the general seed business of B. K. Bliss & Sons, has established himself at 63 Barclay Street, N. Y.

Warren H. Manning, son of Jacob W. Manning, the Reading, Mass., nurseryman, has taken up the business of laying out private grounds.

W. Atlee Burpee & Co., of Philadelphia, report a large increase in their trade over last year, and now employ more hands at shipping orders than ever before.

Jos. Breck & Sons of Boston last season sold over 2,000 bushels of the Pearl of Savoy Potato seed, and the outlook is good for much larger sales this year.

Cold weather and the very late coming of spring has put back trade, but all horticultural dealers seem hopeful of things "picking up" when the ground gets nearer the plow.

The Niagara White Grape Co. are having great success in distributing and selling their vines, if the number of nurserymen-agents, over 5,000, pushing the Niagara, is any criterion.

J. T. Lovett says the demand for the new extra early Blackberry, Early Harvest, is something "immense." Orders for it have already been received by him for nearly 200,000 plants.

The Bowker Fertilizer Co., show a fine record in an increase in their sales from 125 tons in 1873, to 21,876 tons in 1883, and 31,971 tons in 1884. A notable verdict of the farmers and gardeners upon the value of these manures.

The apparent success with which the Niagara is being introduced, will be an example to disseminators of new varieties in future. This is the most successful example on record of keeping the control of a plant in the hands of one party.

H. R. Bassler, formerly with B. K. Bliss & Sons, has formed a partnership with his brother at Manhattan, Kansas, for the raising of bulbs, seeds and plants. Their soil and climate appear to be remarkably favorable to the growing of bulbs.

James B. Kidd, favorably known to the former customers of B. K. Bliss & Sons, with whom he has been for many years, is now carrying on the Seed, Plant and Bulb business on his own account, at Grovesend, Essex Co., N. J. Mr. Kidd is a well informed seedsman.

Mr. Oliver Lundroth informs us that he sees no prospect of a decline in the market for imported seeds, and thinks it ought to be greatly increased. It is natural for Mr. Lundroth to take this ground as his firm are extensive seed growers. But the importers of Canadian seed Pans and foreign flower and vegetable seeds will not agree with him.

The old seed houses who refuse to acknowledge the competition of the younger men will get left in the race. The latter are now forging ahead and winning the laurels of large trade and success. The old must absorb new, young blood. Those that pursue this course gain the advantage of "old men for counsel, young men for war."

**THE AMERICAN GARDEN PRIZES
OF \$1,000**

For New Fruits, Flowers and Vegetables.
For the promotion of horticulture, THE AMERICAN GARDEN offers the following prizes of \$100 each, or silver plate of equal value. No varieties now upon the market to compete. The fruits to be exhibited at the next two annual meetings of

THE AMERICAN GARDEN PRIZES.

—ERRATA.—

Lines 5 to 9 read as below.

The Grapes to be exhibited at the next regular meeting of the American Pomological Society. The prizes to be awarded according to the judgment of a special committee in the autumn of 1886.

The above illustration is made from a photograph of a field of grass belonging to Mr. H. B. Ford, of Brockton, Mass., on which the Stockbridge Grass Fertilizer was applied. It is in fairly good condition, but needing fertilizer. Two bags were applied to the field and the yield, as will be seen by the photograph, was very large; over three tons at the first crop. The price of the Grass Fertilizer has been reduced, so that this year it only costs from \$4.50 to \$9.00 to top dress an acre. Give it a trial. For pamphlets, address the Fertilizer Company, Boston and New York.

WE BRING GOOD LUCK

all of The American Garden family of readers. Good fruit, good flowers, good vegetables, good gardens, good lawns, good health, good profits and good pleasure to all who read and act intelligently.

The Publisher's Corner.

THE AMERICAN GARDEN.
Subscription Terms.

To any address in United States and Canada, postpaid, one year, \$1.00
Six months 60 cts., three months .30
To any foreign country in the Universal Postal Union and all British Colonies, postpaid, one year, \$1.24
For \$5.00 we send 6 copies one year.
For \$7.50 we send 10 copies one year.
Subscriptions may begin at any time.
The magazine is not sent after subscription expires unless by special arrangement.

MAKING GARDEN.

Now that your friends and neighbors are "making garden" why not suggest to them that THE AMERICAN GARDEN would be a very efficient helper in their pleasant work? It would be a very easy matter for our friends to double the circulation and influence of this journal within the next 30 days by showing it to their friends and requesting subscriptions. If you only knew how much better we could make THE AMERICAN GARDEN with your cooperation, we think you would go and speak to all your friends about it right away.

ONE DOZEN MARLBORO RASPBERRY PLANTS,
Direct from the Originator,
VALUE \$2.50.
FREE TO ANY SUBSCRIBER TO THE AMERICAN GARDEN,

Who will send us one new subscription at \$1.00. For two new subscriptions, 24 plants, value \$5.00. For four new subscriptions, 48 plants, value \$10.00. For eight new subscriptions, 100 plants, value \$15.00.

The price of the Marlboro Raspberry has varied as much as the price of Corn in Chicago. But now we think it is settled for this season, at 35 cents each, \$2.50 per dozen, \$15.00 per 100.

OUR OFFER OF THE NIAGARA GRAPE.
For our Subscribers Only.

We now withdraw our offer of the Niagara Grape, as given in the March issue. But so many desire a little more time in which to secure a vine of this valuable Grape, that we will send it on the terms named below, during April only.

We also continue our remarkable offer of the Marlboro Raspberry.

Just think of it!
One dozen plants of this fine new Raspberry (worth now at lowest retail price \$2.50) as a gift from us in return for only the good word to your friend or neighbor necessary to secure his subscription!
Don't you want to start a plantation of this splendid Raspberry?
This offer remains open during April only.
For one new subscriber at \$1.00, one dozen strong plants of the famous Marlboro Raspberry (price \$2.50 per doz.).
For four new subscribers at \$1.00 each, one strong plant of the Niagara White Grape (retails at \$2.00).

This offer is **ONLY FOR OUR SUBSCRIBERS**, but, Any person not a subscriber who wishes to take advantage of the above liberal offers has only to add his or her own name to the number required, and select a present for himself from List 2 in the March Garden.

Surpasses our expectations.—Northwestern Farmer and Dairyman.
We have found it to be a valuable and interesting paper, and prize it most highly.—G. B. Tullidge.

THE AMERICAN GARDEN has been increased in size. It has no superior in the field it occupies.—Hearth and Hall.
I can see the improvement in THE AMERICAN GARDEN since it came into your hands. I wish you much success, as I would not like to do without it.—H. J. Christison, Essex Co., Mass.

I had decided not to renew my subscription, but it has improved so much in the short time you have controlled it, that I feel like continuing it and trying to get some of my neighbors to subscribe.—H. Griffin, New London Co., Conn.

shipping and table qualities; \$100 or plate.

- For the best Gooseberry, - \$100 or plate.
- For the best Blackberry, - \$100 or plate.
- For the best New Fruit, - \$100 or plate.

Particulars concerning the last three above-named, and the prizes for the Flowers and Vegetables, will be announced in our next issue, in order to give time for further careful consideration of the qualities desired, after consultation with leading horticulturists. We also reserve the right to modify the above conditions in such manner as may appear to be for the greatest benefit to American Horticulture.

We invite correspondence and suggestions on the above offers to the end of making them as useful as possible.

We shall make no claims or conditions whatsoever that would influence the naming or disposition of the prize-winning varieties.

The competition is open to North America.

GOOD FOR YOU.

Subscriptions Now Come in Lively.
Hurrah! Hurrah!! Hurrah!!!

Our good friends have been so energetic of late that the opening spring sees us receiving about as many subscriptions as in the height of the season in January.

Thank you, Thank you. By your cooperation we have been enabled to improve the magazine in many ways. But we must have at least twenty thousand more subscriptions on our books in order to make THE AMERICAN GARDEN an assured success. Will you help us do it? The present garden-making time is the best time in all the year to induce your friends to let you send us their subscriptions.

We have received two issues of THE AMERICAN GARDEN under the new administration, and perceive a marked improvement in various directions. It is a well established illustrated monthly, entirely worthy of the patronage of all who are interested in horticulture.—Dr. T. H. Hoskins, in Vermont Watchman.

Polyantha "Mignonette" Roses, and Sweet Pea, on one side, and a large cluster of Gabriel Luizet Roses on the other. The yellow baskets contain Daffodils, *Acacia pubescens* and Maréchal Niel Roses.

Bleeding Heart, *Dielytra spectabilis*, was flowered extensively for Easter decorations, as was the old-fashioned Lemon Lily, *Hemerocallis flava*, with its trumpet form and delightful fragrance.

WILD FLOWERS.

Notwithstanding the magnificent yield in Hybrid Roses and spring flowers, there is a yearning among flower lovers for wild bloom. Buttercups and Dandelions have been forced, but there are not enough to supply a tithe of the demand. Arbutus and Swamp Cowslips are impatiently awaited, as are the fruit blossoms and early flowering shrubs. These are brought to the flower stores as soon as they appear, and are readily disposed of.

Buffalo horns highly polished are the flower-holders of latest introduction: these are swung up by chains, and will hold a vial of water in which to place flower stems, or may be filled with soil and planted with vines. Book on Roses. E. O. A., *Ind.*—Rivers' work on Roses is out of print and would be difficult to obtain. H. B. Ellwanger's "The Rose," is the latest and decidedly best work on the Rose, especially for the American Rose-grower.

Hardiness of Peaches. *Amateur, Chicago.*—Peaches cannot be grown successfully where the thermometer falls every year lower than 12° below zero; this degree of cold kills the buds, so that the trees cannot bear fruit the following season. Forty degrees below zero would kill the entire tree.

Hyacinths and Ranunculus. J. G., *Philadelph.*—To promote the rising of the flower stalks of Hyacinths above the leaves, florists cover the plants lightly with sheets of paper. The usual season for potting Ranunculus is in October or November, but as the roots, if kept dry, retain their vitality for two or three years, they may be planted at any time. They require a rich, rather stiff soil, and must never be allowed to become too dry.

Tuberoses. Mrs. F. A. M., *Litchfield, Conn.*—Bulbs that have bloomed will rarely flower again, so that it is not worth while to run the risk. To propagate Tuberoses, the small off-sets that form around the bulb are broken off, and planted in rows in rich, light soil, tacking them up again before winter, of course. They will bloom the second or third year. Unless these off-sets are broken off when planting the flowering bulbs, these will not bloom well. They may be planted out-doors about the first of June, or started in pots in hot beds about the middle of April.

Horse Radish Culture. E. J. S., *Rockland, Md.*—Horse Radish is extensively grown by market gardeners near large cities. It requires a very rich, deep, rather moist soil, and is raised from sets, that is, thin pieces of root, the trimmings of the previous year's crop, cut into pieces of four to six inches in length. The land should be well worked before planting, which has to be done early in spring. In field culture the sets are planted in rows about three feet apart and eighteen inches in the rows. The planting is done by simply making a hole with a pointed stick, dropping the set so that it is about three inches below the surface, and then pressing it firmly with the foot. During the first month or two the ground has to be kept well cultivated and clean; later the leaves cover the entire ground so as to make cultivation useless or unnecessary.

OUR BOOK TABLE.

New York State Reformatory at Elmira, N. Y. Annual Report of the Board of Managers. **Cattlemen.** Proceedings of the First National Convention, held in St. Louis, Mo., Nov. 17th to 22d, 1884.

Facts about Canned Goods. Report of the Canned Goods Committee of the New York Mercantile Exchange.

Montgomery County, Ohio, Horticultural Society. N. Olmer, president; Wm. Ranscy, secretary. Proceedings of the January and February meetings.

How I Made Money at Home, with the Incubator, Bees, Silkworms, Canaries, Chickens, and One Cow: by John's Wife. 82 pages; illustrated. Mailed for 30 cents. Hunter MacCulloch, 1828 Reed Street, Philadelphia, Pa.

Babyhood, New York. A monthly magazine devoted exclusively to the care of infants and young children and the general interests of the nursery, is improving with each number; it ought to be in the hands of every mother.

Potatoes, by Chas. V. Mopes, published by the Mopes Formula Co., 158 Front Street, New York. In this pamphlet the author brings together the results of many recent experiments by himself and others, showing the demand for complete, not partial fertilization, showing the fallacy of the popular belief that commercial or concentrated fertilizers are mere "stimulants." This is a valuable addition to our Potato literature.

Outing. The April issue of this bright and charming monthly indicates the purpose of its publishers to place it in the foremost rank of American magazines. It is enlarged to nearly double its former size, and its compound title is wisely simplified to the expressive *Outing*. A new and tasteful cover and increased illustration of the best sort give it comeliness, and its table of contents is substantial and alluring.

A leading feature of the number is a strong group of letters on the preservation of the Adirondack Forests, by a score of eminent public men.

Good Housekeeping. Messrs. Clark W. Bryan & Co., New York, and Holyoke, Mass., have made two decidedly "taking" periodicals in *The Paper World* and *The Builder*, and now attempt a still more ambitious venture in "Good Housekeeping," a new, illustrated, semi-monthly journal "in the interests of the higher life of the household." A felicitous title, a worthy aim, skilled conductors, able writers, perfect printing: with all these in union, an appreciative public will surely be found. Mr. Bryan has a happy method in journalism which is bringing him merited success in the accomplishment of great good among a wide range of readers in varied fields of action.

The Peanut Plant, Its Cultivation and Uses, by B. W. Jones. Published by the Orange Judd Co., New York. Every page of this pamphlet shows that it is written by one who is thoroughly familiar with his subject in all its bearings. The importance of the Peanut crop—already amounting to two millions of bushels annually—is so rapidly increasing that a work of this kind, giving in plain, practical language all the necessary directions for planting, cultivating, harvesting, marketing and much other interesting information, will be welcomed by all those living in the Peanut range, which, according to the author, extends over all the country having a growing season of five months exempt from frost.

A Brief of Horticulture in Michigan, by Chas. W. Garfield, Grand Rapids, Mich., Secretary of the Mich. Horticultural Society. This pamphlet of thirty-five pages forms a valuable and interesting contribution to our pomological literature, giving exact historical and statistical information about one of the most important fruit regions of our continent. From accurate data the author estimates the sales of Apples from Michigan the past season at 5,000,000 bushels, at prices ranging from \$1.50 to \$2.00 per barrel. The area in fruit-planting, especially in Peaches and small fruits, is rapidly increasing this year. An excellent referring to which the relative position, railway communications, water privileges, latitude, etc., may readily be observed as descriptions and statistics of the various localities are recited.

Begin to eat rotten apples and they will be all rotten before you get through the barrel.

Warren H. Manning, son of Jacob W. Manning, the Reading, Mass., nurseryman, has taken up the business of laying out private grounds.

W. Atlee Burpee & Co., of Philadelphia, report a large increase in their trade over last year, and now employ more hands at shipping orders than ever before.

Jos. Breck & Sons of Boston last season sold over 2,000 bushels of the Pearl of Savoy Potato seed, and the outlook is good for much larger sales this year.

Cold weather and the very late coming of spring has put back trade, but all horticultural dealers seem hopeful of things "picking up" when the ground gets nearer the plow.

The Niagara White Grape Co. are having great success in distributing and selling their vines, if the number of nurserymen-agents, over 5,000, pushing the Niagara, is any criterion.

J. T. Lovett says the demand for the new extra early Blackberry, Early Harvest, is something "immense." Orders for it have already been received by him for nearly 200,000 plants.

The Bowker Fertilizer Co., show a fine record in an increase in their sales from 125 tons in 1873, to 21,876 tons in 1883, and 31,971 tons in 1884. A notable verdict of the farmers and gardeners upon the value of these manures.

The apparent success with which the Niagara is being introduced, will be an example to disseminators of new varieties in future. This is the most successful example on record of keeping the control of a plant in the hands of one party.

H. R. Bassler, formerly with B. K. Bliss & Sons, has formed a partnership with his brother at Manhattan, Kansas, for the raising of bulbs, seeds and plants. Their soil and climate appear to be remarkably favorable to the growing of bulbs.

James B. Kidd, favorably known to the former customers of B. K. Bliss & Sons, with whom he has been for many years, is now carrying on the Seed, Plant and Bulb business on his own account, at Grovesend, Essex Co., N. J. Mr. Kidd is a well informed seedsman.

Mr. Oliver Landreth informs us that he sees no prospect of a decline in the trade in imported seeds, and thinks it ought to be greatly increased. It is natural for Mr. Landreth to take this ground as his firm are extensive seed growers. But the importers of Canadian seed Peas and foreign flower and vegetable seeds will not agree with him.

The old seed houses who refuse to acknowledge the compulsion of the younger men will get left in the race. The latter are now forging ahead and winning the barrels of large trade and success. The old must absorb new, young blood. Those that pursue this course gain the advantage of "old men for counsel, young men for war."

THE AMERICAN GARDEN PRIZES OF \$1,000

For New Fruits, Flowers and Vegetables.

For the promotion of horticulture, THE AMERICAN GARDEN offers the following prizes of \$100 each, or silver plate of equal value. No varieties now upon the market to compete. The fruits to be exhibited at the next two annual meetings of the American Pomological Society. The prizes to be awarded according to the judgment of a committee at the annual meeting in 1886. Two years are required in order that the test may be of value.

For the best Grape which shall combine territorial adaptability and superior shipping qualities, with superior table quality; \$100 or plate.

For the best Strawberry which shall combine territorial adaptability and superior shipping qualities with superior table quality; \$100 or plate.

For the best Raspberry which shall combine earliness, productiveness and superior shipping and table qualities; \$100 or plate.

For the best Gooseberry, - \$100 or plate.

For the best Blackberry, - \$100 or plate.

For the best New Fruit, - \$100 or plate.

Particulars concerning the last three above-named, and the prizes for the Flowers and Vegetables, will be announced in our next issue, in order to give time for further careful consideration of the qualities desired, after consultation with leading horticulturists. We also reserve the right to modify the above conditions in such manner as may appear to be for the greatest benefit to American Horticulture.

We invite correspondence and suggestions on the above offers to the end of making them as useful as possible.

We shall make no claims or conditions whatsoever that would influence the naming or disposition of the prize-winning varieties.

The competition is open to North America.

GOOD FOR YOU.

*Subscriptions Now Come in Lively.
Hurrah! Hurrah!!! Hurrah!!!*

Our good friends have been so energetic of late that the opening spring sees us receiving about as many subscriptions as in the height of the season in January.

Thank you, Thank you. By your coöperation we have been enabled to improve the magazine in many ways. But we must have at least *twenty thousand more* subscriptions on our books in order to make THE AMERICAN GARDEN an assured success. Will you help us do it? The present garden-making time is the *best time in all the year* to induce your friends to let you send us their subscriptions.

We have received two issues of THE AMERICAN GARDEN under the new administration, and perceive a marked improvement in various directions. It is a well established illustrated monthly, entirely worthy of the patronage of all who are interested in horticulture.—*Dr. T. H. Hoskins, in Vermont Watchman.*

The above illustration is made from a photograph of a field of grass belonging to Mr. H. B. Packard, of Brockton, Mass., on which the Stockbridge Grass Fertilizer was applied. It was a field in fairly good condition, but needing fertilizer. Two bags were applied to the acre, and the yield, as will be seen by the photograph, was very large; over three tons at the first crop. The price of the Grass Fertilizer has been reduced, so that this year it only costs from \$4.50 to \$9.00 to top dress an acre. Give it a trial. For pamphlets, address Bowker Fertilizer Company, Boston and New York.

WE BRING GOOD LUCK

To all of The American Garden family of readers. Good fruit, good flowers, good vegetables, good gardens, good lawns, good health, good profits and good pleasure to all who read and act intelligently.

The Publisher's Corner.

THE AMERICAN GARDEN.
Subscription Terms.

To any address in United States and Canada, postpaid, one year, \$1.00
Six months 60 cts., three months .30
To any foreign country in the Universal Postal Union and all British Colonies, postpaid, one year, \$1.24
For \$5.00 we send 6 copies one year.
For \$7.50 we send 10 copies one year.
Subscriptions may begin at any time.
The magazine is not sent after subscription expires unless by special arrangement.

MAKING GARDEN.

Now that your friends and neighbors are "making garden" why not suggest to them that THE AMERICAN GARDEN would be a very efficient helper in their pleasant work? It would be a very easy matter for our friends to double the circulation and influence of this journal within the next 30 days by showing it to their friends and requesting subscriptions. If you only knew how much better we could make THE AMERICAN GARDEN with your coöperation, we think you would go and speak to all your friends about it right away.

ONE DOZEN MARLBORO RASPBERRY PLANTS,
Direct from the Originator,
VALUE \$2.50.
FREE TO ANY SUBSCRIBER TO THE AMERICAN GARDEN,

Who will send us *one new* subscription at \$1.00. For *two new* subscriptions, 24 plants, value \$5.00. For *four new* subscriptions, 48 plants, value \$10.00. For *eight new* subscriptions, 100 plants, value \$15.00.

The price of the Marlboro Raspberry has varied as much as the price of Corn in Chicago. But now we think it is settled for this season, at 35 cents each, \$2.50 per dozen, \$15.00 per 100.

OUR OFFER OF THE NIAGARA GRAPE.
For our Subscribers Only.

We now withdraw our offer of the Niagara Grape, as given in the March issue. But so many desire a little more time in which to secure a vine of this valuable Grape, that we will send it on the terms named below, *during April only.*

We also continue our remarkable offer of the Marlboro Raspberry.

Just think of it!

One dozen plants of this fine new Raspberry (worth now at lowest retail price \$2.50) as a gift from us in return for only the good word to your friend or neighbor necessary to secure his subscription!

Don't you want to start a plantation of this splendid Raspberry?

This offer remains open during April only.

For one new subscriber at \$1.00, one dozen strong plants of the famous Marlboro Raspberry (price \$2.50 per doz.).

For four new subscribers at \$1.00 each, one strong plant of the Niagara White Grape (retails at \$2.00).

This offer is **ONLY FOR OUR SUBSCRIBERS**, but, Any person not a subscriber who wishes to take advantage of the above liberal offers has only to add his or her own name to the number required, and select a present for himself from List 2 in the March Garden.

Surpasses our expectations.—*Northwestern Farmer and Dairyman.*

We have found it to be a valuable and interesting paper, and prize it most highly.—*G. B. Tullidge.*

THE AMERICAN GARDEN has been increased in size. It has no superior in the field it occupies.—*Hearth and Hall.*

I can see the improvement in THE AMERICAN GARDEN since it came into your hands. I wish you much success, as I would not like to do without it.—*H. J. Christison, Essex Co., Mass.*

I had decided not to renew my subscription, but it has improved so much in the short time you have controlled it, that I feel like continuing it and trying to get some of my neighbors to subscribe.—*H. Griffin, New London Co., Conn.*

CATALOGUES RECEIVED.

John S. Collins, Moorestown, N. J. Price List of fruit plants and trees; also circular of the famous Comet Pear, for which this firm is headquarters.

J. T. Lovett, Little Silver, N. J. Guide to Fruit Culture. This is an elegant and handsome pamphlet, combining a descriptive and illustrated Catalogue of Small Fruit plants, Fruit-trees, etc., with a condensed manual of Fruit Culture. The assortment is unsurpassed, the descriptions are given with commendable clearness and veracity, and the directions are practical and reliable.

Ellwanger & Barry, Mount Hope Nurseries, Rochester, N. Y. Descriptive Catalogue of Fruits. A full assortment of all the best varieties. This firm is famous for its excellent stock. Industry Gooseberry, of which a colored illustration is given, a specialty. Also descriptive catalogue of Select Roses, with beautiful colored plate of their new seedling hybrid remontant Rose, "Marshal P. Wilder."

ADVERTISERS DO SAY

That The American Garden Pays.

Of course it does, because our readers are all progressive gardeners and well-to-do amateurs. The latest comments are these:

I know that THE AMERICAN GARDEN pays.
H. G. CORNEY, Cornwall-on-Hudson, N. Y.

We have received a good many orders from our advertisement in AMERICAN GARDEN. One from the West Indies. Our advertisements have paid us well. W. W. RAWSON & Co., Boston, Mass.

We think THE AMERICAN GARDEN pays us well. BOWKER FERTILIZER Co., Boston and New York.

The liberal patronage of our advertising columns, and the increase in size of the individual advertisements, is in itself a favorable comment. No agricultural or horticultural journal in America has a larger or a better class of advertisements than this. None has a more intelligent and appreciative circle of readers.

TO HOUSEKEEPERS

20 GOOD KITCHEN UTENSILS

well made and of good material, mailed to any part of the United States, on receipt of \$1.00.

The Ladies' Favorite Floral Set, as below, 14 inches long, bronzed and polished; mailed as above on receipt of \$1.00.

Both sets to one address for \$1.75. A liberal discount to any person who will send for 10 or more sets at once.

LYMAN & CO., Northampton, Mass.

ORCHIDS.

Write for our New Catalogue. It will give you practical hints on how to grow these beautiful plants. We are now making special offers, and have made selections of the different varieties to suit the taste of the buyer.

WE OFFER

12 CATTLEEVAS,	12 kinds good plants, for	\$12.00
12 LÆLIAS,	6 " " "	9.00
12 ONCIDIUMS,	12 " " "	9.00
12 DENDROBIUMS,	12 " " "	9.00

Any 20, in varieties, of *Petunia*, single; *Phlox Drummondii*; *Gladiolus* and *Tuberose* bulbs, for \$1.00. 12 Everblooming or eight hybrid *Roses* for \$1.00. 100 plants in varieties, except *Roses*, \$5.00.

N. STUDER, Florist, WASHINGTON, D. C.

WHITE INK.

LOVETT'S GUIDE TO FRUIT CULTURE

A veteran Horticulturist of the West writes: "Let me heartily thank and congratulate you on the perfect get-up of your Guide to Fruit Culture just received. As father of Western Grape culture, with nearly 40 years' experience; and as one of the first Nurserymen in the West, I have received and examined most of our best American Nursery Catalogues, and if there was an award to be given for the best you should have it. Again, you have dealt so fairly in describing the value of our most popular fruits, and particularly that noble fruit the Grape; and the faults as well as the merits of the respective varieties, displaying the greatest fairness and knowledge." Guide to Fruit Culture mailed to all applicants with colored plates for 10 cents; without plates, 5 cents. Price-list free.

J. T. LOVETT, Little Silver, New Jersey.

A. H. MATTHEWS' NEW SEED DRILL.

The Latest Improvement in Garden Seeders: made by the oldest manufacturer in the business; don't buy the old pattern when you can have the new at the same price. Also our "LITTLE GEM," never before offered, a reliable cheap drill at half the price of others. Send for circulars to manufacturers.

SMALL & MATTHEWS, Boston.

New Cannas Brilliantissima.

This *Canna* originated with me in 1881. It is a hybrid between *Annie Discolor* and *Pres. Fairer*. It grows compact in hill; is tall; leaves long, narrow, lustrous metallic purple. For strong endorsement of Thomas Meehan, see October No. of "Gardeners' Monthly," page 294. It was awarded highest premium for "plant of merit" at Illinois State Fair, 1884. Sound sets will be sent by mail, guaranteed, at \$1 each. Address, at WASHINGTON HEIGHTS, Ill., D. S. HEFFRON.

The Three Best Peas For Successional Crop.

Warranted Original Headquarters Seed.

BLISS'S EVERBEARING PEA.

Bliss's American Wonder. The earliest, dwarfest and sweetest. Pkt., 10c., qt., 40c.; by mail, 65c.

Bliss's Abundance. One of the most productive and richest marrow. Pkt., 10c., qt., 75c.; by mail \$1.00.

Bliss's Everbearing. This fine general crop pea continues longer in bearing than any other, retaining its delicious tenderness until the last picking. Per pkt., 10c.; qt., 75c.; by mail, \$1.00.

Special Inducements to Readers of this Paper.

We will send by mail, postage paid, one quart each of the above three new varieties of peas upon receipt of \$2.50 in postage stamps, or money order; and in addition allow each purchaser to select Flower Seeds from our illustrated catalogue to the value of \$1.00. This substantial offer is made with the view of introducing ourselves to the readers of this valuable horticultural journal, and at the request of its new manager. As it only stands good until our stocks are sold the necessity for taking early advantage of it is apparent. Our catalogue containing only "the best seeds" for farm and garden will be mailed free to all applicants.

A. D. COWAN & CO.,

P. O. Box 2541. 114 Chambers St., N. Y.

The houses of A. D. Cowan & Co., and W. H. Carson & Co., having been recently consolidated, the managing staff consists only of practical seedsmen, and comprises the following well known names:

A. D. Cowan, formerly with B. K. Bliss & Sons, N. Y. W. H. Carson, formerly of F. Henderson & Co., and Thornburn & Carson, N. Y. Chas. G. Webber, formerly with Jas. Fleunig, N. Y. T. V. W. Bergen, seed grower, Bay Ridge, L. I.

Print Butter brings much higher prices than tub, therefore every dairyman should supply himself with a Printer and Shipping Boxes, so as to put it on the market in the most attractive form.

THE NESBITT PRINTER AND THE COOLEY Improved Carriers

are acknowledged to be the best implements for the purpose.

Send for Illustrated Circulars.

CATALOGUES RECEIVED.

Josiah Hawkins, Southport, Conn. A valuable circular of Onions, Onits, Corn and Potatoe seed.

Parker & Wood, Boston. A large, handsome catalogue of seeds, implements and woodware.

Geo. Phinney, Starbuck Bay, Wis. Circulars of evergreen and forest trees, and of seed Potatoes.

C. H. Thompson & Co., Boston. An attractive and well printed catalogue of seeds and imple- ments.

Joseph D. Fitts, Providence, R. I. Catalogue of small fruit plants. Mr. F. makes Steuwberrles a specialty.

Bradley Fertilizer Co., Boston. A catalogue of testimonials from farmers on the high quality of their manures.

L. W. Goodell, Amherst, Mass., is a successful grower of flower seeds, of which he offers a choice list of the old favorites.

Stark Nurseries, Louisiana, Ma. Price list of root grafts, seedlings, surplus stock, etc. Also a description of the "Marlana" Plum.

John G. Burrow, Fishkill Village, N. Y., runs the Jefferson Grape as a specialty, and seems to be having considerable success with it.

Robert Scott & Son, Philadelphia. Descriptive and illustrated catalogue of Roses, new and old, with many illustrations and valuable cultural directions.

D. S. Heffron, Washington Heights, N. Y. Mr. H., well known as the introducer of new Potatoes, is a florist and nurseryman, and sends out a neat catalogue.

Gardner B. Weeks, Syracuse, N. Y., is the only maker of the widely used "grappling hay-fork." We know this to be an excellent apparatus, by experience.

Henderson's American Farmers' Manual, from Peter Henderson & Co., New York, is a showy catalogue of seeds for the farm, after the English style.

Luther Putnam, Cambridge, Vt. Circular of 200 kinds of seed Potatoes. Mr. P.'s stock took first prize at the State Fair in 1884, as the largest and best collection.

Fred. W. Kelsey, 208 Broadway, New York. Select List of new and rare trees, shrubs and plants. Japanese Maples, Rhododendrons, Azaleas, etc., specialties.

Jacob W. Manning, Reading, Mass. Descriptive catalogue of fruit, forest, ornamental and flowering trees and plants. Also catalogue of hardy herbaceous plants, ferns and shrubs.

Kissena Nurseries, Parsons & Sons Company, Flushing, N. Y. Select list from the descriptive catalogue of ornamental and fruit trees and shrubs, of this well known and reliable firm.

Geo. S. Josselyn, Fredonia, N. Y. Descriptive Catalogue of American Grape-vines, small fruit, etc. Many illustrations and colored plates of the famous Fay's Prolific Currant, for which this is headquarters.

Mapes' Complete Manures, 158 Front street, New York. Descriptive Price List of complete manures for special crops and general use, together with much valuable information about fertilizers and growing crops in general.

Chas. A. Reeser, Innisfallen Greenhouses, Springfield, O. Catalogue of one of the largest collections of Roses in the country. Also a full assortment of bedding and greenhouse plants, and vegetable and flower seeds.

E. D. Sturtevant, Bordentown, N. J. Catalogue of rare water Lillies and other choice aquatic plants, with directions for their culture. Mr. S. has made himself famous as a florist by his novel exhibitions of these choice plants.

W. W. Rawson & Co., Boston, though the youngest house in the trade (successors to Everett & Glenson), have issued the most elegant and beautifully printed catalogue we have yet seen. The descriptions of varieties are well written.

T. B. Everett & Co., Boston, are New England agents for many of the best implements of the day, such as the La Dow Harrow, and Eureka Mower, etc., and manufacturers of the Matthews Seed Drill. A view on the cover of their catalogue is a pleasant scene on Daniel Webster's

BEAUTIFUL FAIRY ROSES From Japan, that Wonder Land of Horticultural Beauty.

Something every one can succeed with! Sure to give satisfaction! They bloom in immense clusters, 30 to 50 together on a single stem. The flowers are of singular purity, and resemble miniature camellias in their regularity. They are wonderfully beautiful and bloom constantly, and are entirely distinct from every other rose, and must become very popular. They are elegant, blooming as freely as a geranium, and require as little care.

4 beautiful sorts—MIGNONETTE, clear pink, the freest bloomer of all, each 20 cts. LITTLE WHITE PETS, very large, pure white; elegant, 30 cts. each. MAD'ELLE CECIL BRENER, salmon blush; splendid, 20 cts. each. PAQUETTE, pure white. Very free bloomer, 20 cts. each—strong plants. One each of the 4 sorts for only 75 cts.

Our collection of CHRYSANTHEMUMS contains all the best varieties of both American and European introduction, and cannot be surpassed if equalled.

We send, postpaid, OUR GEM COLLECTION of Chrysanthemums, 31 choicest sorts for only \$7.50. In selecting this set it has been our object to offer a set of Chrysanthemums that would embrace the widest range of color, each sort being distinct and elegant, so that those who wish to grow but few kinds, might be able to purchase the choicest and most desirable varieties and be sure of getting something very fine and with a few get the most desirable. Full description of these together with the many other beautiful varieties in our collection in catalogue.

We wish we could convey in some small measure the extreme delicacy and richness of coloring of our SET OF SUPERB NEW SINGLE DAHLIAS, a marked improvement over anything that has ever before been offered, very fashionable, and these magnificent sorts will add greatly to their popularity. We were awarded prizes for these by the New York Horticultural Society; 12 beautiful varieties—strong plants—for only \$3.50.

LILIUM AURATUM. The Queen of Lilies. Our importation from Japan, of this the most beautiful of the Lily family, is unusually fine. Large healthy bulbs, 40 cts. each; 3 for \$1.00, 12 for \$3.00.

Do You Want a Garden of Rare Beauty?

All those who want the gayest garden with the least trouble and expense, should not fail to try our magnificent IMPROVED DOUBLE GARDEN POPPIE. They grow about 2 feet high, with magnificent large flowers, of the richest and most intense shades of color. They produce an effect that cannot be matched for brilliancy, perfectly dazzling. This grand show which we offer has been produced after many years of high cultivation. For brilliant, dazzling colors these Poppies are equalled only by the Tulip—13 beautiful colors—White, White Striped Red, White and Light Purple, Rose Light Red, Scarlets and White, Dark Scarlet and Violet, Lilac and Scarlet, Dark Madone, Gray, Cinnabar and Violet, Black Brown and Cinnabar, Fiery Scarlet. Seed of any color, per paper, 5 cts.—collection, 13 papers in all for only 50 cents. Any of these articles sent postpaid, on receipt of price. These together with many other attractions are freely described in our

PLANT AND SEED CATALOGUE

For 1885, which is very complete, handsomely illustrated, artistic, of particular interest to all lovers of Choice Flowers, sent free to all readers of THE AMERICAN GARDEN, enclosing stamp to pay postage.

F. R. PIERSON, Florist & Seedsman, P. O. BOX TARRYTOWN, NEW YORK.

BURPEE'S EMPIRE STATE POTATO,

Now offered for the first time, is decidedly the best and most productive Main Crop Potato ever introduced. It is strikingly beautiful; skin white and smooth; eyes shallow but strong; flesh pure snowy white and of peculiarly rich and delicate flavor. Of vigorous growth, the tubers cluster compactly in the hill. It is enormously productive, having yielded at the rate of nearly 600 bushels per acre, and thoroughly tested along-side of the most popular varieties. Burpee's Empire State has, in every case, outyielded all others. Prices: per bushel, \$5.00; barrel, \$10.00. By mail, 75 cts. per lb.; 3 lbs. for \$2.00, post-paid. For full particulars, illustrations and testimonials, see BURPEE'S FARM ANNUAL FOR 1885, which will be sent free to any address.

W. ATLEE BURPEE & CO., Philadelphia, Pa.

A NEW DEPARTURE.

FLOWER and GARDEN SEEDS Delivered in any part of the United States at catalogue price.

SEEDS, SEEDS, SEEDS

The Oldest Established Seed House in New York invites attention to their **HIGH CLASS SEEDS**

Send for Catalogues.

J. M. THORBURN & Co., 15 JOHN ST. NEW YORK.

NEW PERPETUAL PEA.

I was the first to introduce this from England last year, and on my trial grounds it proved superior to the Everbearing. It requires no bushing, of branching habit about 24 inches high; seed wrinkled; a wonderful cropper, strong and robust; foliage attractive; very desirable for family use and worthy of trial for market. Packet 15c, 4 packets \$1.00.

I offer 30 other varieties of Peas mostly of my own growing, New Asparagus, Beans, Cucumbers, Cabbage, Celery, Corn, Dandelion, Melons, Onions, Potatoes, Grains, Squash, Turnips, Tomatoes and other prime NORTHERN GROWN SEEDS.

Strawberry Plants, Grape, Currant and other small fruit plants. Roses, Verbenas and thousands of other plants.

FLOWER SEEDS—My Pansies, Asters, Balsams, Pinks, Daisies, Hollyhocks, Mignonette, Primulas, Petunias, Sweet Peas, are among the finest in America.

Circle of Specialties sent free IF you mention AMERICAN GARDEN.

C. E. ALLEN, Brattleboro, Vt.

THE AMERICAN GARDEN has a reputation in horticultural literature.—L. J. Temple, Colorado.

THE AMERICAN GARDEN deserves a more liberal support than it has yet obtained, but under the new management we hope its sphere of usefulness will be greatly extended.—N. Y. Sun.

I like it very much, and always did.—John Barker, Chairman Committee on Gardens, Mass. Horticultural Society.

I have selected THE AMERICAN GARDEN and The Rural from among the many offered, AS THE BEST.—M. L. McQuane, Berrien Co., Mich.

See my \$5.00 List of SMALL FRUITS For Country Homes.

A remarkably liberal offer.—Also a large assortment of all the new and standard SMALL FRUITS and GRAPE VINES at popular prices. Illustrated Descriptive Catalogue free. Address: H. G. CORNEY, (Successor to) Cornwell-on-Hudson, N. Y. (E. P. ROE.)

BEAUTIFUL EVER-BLOOMING ROSES!

Our choice IMPORTED ROSE PLANTS are two and three years old, and from one to four feet high. They will produce 20 to 40 flowers on each bush the first season. Only the best varieties are sent out, and all are carefully labelled. Directions for planting and treatment are sent with each order. The Roses we offer are those which florists buy to force for cut flowers for spring sales. They are far superior to the little things sent out by some dealers in two and four inch pots.

Prices: 10 strong plants, \$1.50; 25 plants, \$3.50; 50 plants, \$6.50; 100 plants, only \$12.00. Standard Tree Roses, \$5.00 per doz. Send orders to

SCHULTHEIS BROTHERS, ROSE GROWERS AND IMPORTERS,
P. O. Box 78, COLLEGE POINT, L. I., N. Y.

To Raise Cheap Corn, we Must Grow Large Crops!

THE WAUSHAKUM.

Eight rowed, yellow flint corn, has yielded more than Eighty bushels shelled corn per acre, on an entire field. The seed I offer was grown from corn produced at Waushakum Farm, So. Framingham, Mass. References: Dr. E. L. Sturtevant, Director N. Y. Agr. Exp. Station; E. H. Libby, Publisher THE AMERICAN GARDEN.

Prices: One Bushel, \$1.50; One half Bushel, 80 cents; One Peck, 50 cts.; Three Bushels, or more, \$1.25 per bushel. One pound by mail, postpaid, 20c. No charge for packages.

E. S. GOFF, Agricultural Experiment Station, Geneva, N. Y.

HAND Fertilizer Dropper
RANDOLPH HAND
Fertilizer Dropper in the hands of any ordinary man or boy is perfection itself. As he moves over the field with rapid steps, as if by magic it will drop any amount of Fertilizer required per acre, and scatter it evenly about the hill. Send for circulars, testimonials, and price. Agents wanted. Address: **P. F. RANDOLPH,** Liberty Corner, N. J.

A BEAUTIFUL LAWN can be quickly obtained by sowing **HENDERSON'S "CENTRAL PARK" LAWN GRASS SEED,**

a mixture of selected grasses identical with those used in forming the lawns of New York's famous park. Over 60,000 packages sold by us last season. One quart of seed will sow an area of 15x20 feet—200 square feet, or for an acre 5 bushels are required. Instructions for sowing and after treatment sent free with every order. Price, 25 cents per quart. (If by mail, add 10 cents per quart for postage.) If by freight or express, \$1.50 per peck; \$5.00 per bushel.

HENDERSON'S LAWN ENRICHER,

For Old and New Lawns.

For many years we have been using in our own grounds a fertilizer which we have found to be never failing in inducing a rapid and rich green growth to the lawn. To meet the wants of hundreds of patrons who desire a clean, portable and convenient lawn dressing, we now offer them the mixture designated as "HENDERSON'S LAWN ENRICHER." By express or freight, a 10 lb. package for \$2.00; 20 lb. package for \$3.00; 50 lb. package for \$7.00; 100 lb. package for \$12.00. As a guide in ordering, we would state that a 10 lb. package is sufficient to go over an area of 300 square feet. New Catalogue of SEEDS and PLANTS mailed on receipt of 6 cents (in stamps.)

Peter Henderson & Co. 35 & 37 Cortlandt St., New York. SEEDSMEN & FLORISTS.

BURPEE'S EMPIRE STATE POTATO,

Now offered for the first time, is decidedly the best and most productive Main Crop Potato ever introduced. It is strikingly beautiful; skin white and smooth; eyes shallow, but strong; flesh pure snowy white and of peculiarly rich and delicate flavor. Of vigorous growth, the tubers cluster compactly in the hill. It is enormously productive, having yielded at the rate of nearly 600 bushels per acre, and thoroughly tested along-side of the most popular varieties. Burpee's Empire State has, in every case, outyielded all others. Prices: peck, \$1.50; bushel, \$5.00; barrel, \$10.00. By mail, 75 cts. per lb.; 3 lbs. for \$2.00, postpaid. For full particulars, illustrations and testimonials, see BURPEE'S FARM ANNUAL FOR 1885, which will be sent free to any address.

W. ATLEE BURPEE & CO., Philadelphia, Pa.

The Records Show That the Butter-Yield of the COOLEY CREAMERS

CABINET STYLE.

has never been equalled by any creamery, pan, or separator. They carried off the premiums for the GREATEST PER CENT OF YIELD in the great dairy States of Iowa and Wisconsin. Their combined products of butter and cheese reaching nearly sixteen pounds to the hundred pounds of milk. They take the lead in the CREAM GATHERING SYSTEM.

ELEVATOR STYLE.

THE DAVIS SWING CHURN.

AWARDED SIX SILVER MEDALS

in the last four years over all competitors. Because it operates the easiest. Because it churns more thoroughly, and consequently makes the most butter. Because it is the easiest to clean. Because the cover is always on top, avoiding all leakage and emptying the cream on the floor, as is frequently the case with revolving churns. Send for Illustrated Circulars. Vermont Farm Machine Co., Bellows Falls, Vt.

NEW & RARE FRUITS AND SEEDS

and all the old reliable sorts. NONE BETTER. None Cheaper. Plants, Trees, Vines, Seeds, &c. by mail, a specialty. Postage paid; 64 CHOICE CHEAP \$1 SETS arrival guaranteed. CANNA EHEMANNI.
THE NEW CANNAS.

Ehemanni. This is a beauty in every sense. The massive deep green Musa-like leaves alone would make it a valuable acquisition, but when we see its magnificent crimson flowers, over three inches long and two inches wide, suspended from its deep red whip-like flower stalks, it is difficult to find words to express our admiration—so different in general character that it is hard to believe that it is a Cannas. The growth of the plant is remarkably strong and robust, growing from five to seven feet high, each stalk terminating with a long flower spike. We have often had six spikes in bloom at one time, bearing from twenty to thirty flowers.

Gladioliflora. Is quite distinct from *Ehemanni*, the color being a rich amber or orange. The flowers are very large, growing erect instead of drooping. The foliage is of a beautiful blue-green, rather narrow; plant grows very compact and is remarkably free-flowering, forming nearly solid masses. It does not exceed six feet in height, and is very expressive. A plant of each of these Cannas planted in good rich soil, either separately on the lawn or in mixed borders, or for centers of large beds, form most beautiful objects.

Prices for the above new Cannas, 50 cts. each; \$4.50 per dozen, by express.

CLUB RATES FOR CANNA EHEMANNI AND GLADIOLIFLORA.

By express only: Three of each, six pieces, \$2.25; six of each, twelve pieces, \$3.50.

We are told that our catalogue (which we send on application) is one of the best and most useful published this year. It contains many things that we introduce, and offer exclusively. Among them, for instance, we offer 3 *Clematis* for \$1.00. They are *Jackmaui*; *Crispa*, delicious fragrance; *Carsinea*, brilliant scarlet.

swanley White Violet, the first and only really good White Violet ever introduced. 25 cts. each; five for \$1.00.

V. H. HALLOCK, SON & THORPE, Queens, N. Y.

DAKOTA RED POTATO!

The publisher of **THE AMERICAN GARDEN**, then specialist to **Hiram Shibley & Co.**, in a test at Rochester, N. Y., in 1883, found this to be the **MOST PROLIFIC OF ANY OF 125 VARIETIES**, and equal in quality to any of them.

Last season it again yielded enormously. From one pound of seed, H. C. Pearson, N. Y., grew 2,558 lbs.; A. Rose, N. Y., 2,340 lbs.; C. F. Thompson, N. H., 2,118 lbs.; Chas. C. Miller, O., 1,675 5-7 lbs.; G. W. P. Jerrard, Me., 1,638 1-4 lbs.; E. H. Vick, N. Y., 1,320 1-2 lbs.

These yields are certified to by Wm. Humilton, Caledonia, N. Y., President of Western New York Agricultural Society; James S. Grinnell, Greenfield, Mass., formerly Acting Commissioner of Agriculture, at Washington, D. C.; John E. Russell, Boston, Mass., Secretary of State Board of Agriculture of Massachusetts; L. P. Roberts, Professor of Agriculture at Cornell University, Ithaca, N. Y., committee.

These enormous yields of potatoes, grown from one pound of seed by careful cultivation and with the liberal use of a high grade fertilizer, are worthy the consideration of all interested in the culture of the potato, or in the possibilities of reproduction in the Vegetable Kingdom. 2,538 pounds from one pound of seed greatly surpasses, we believe, anything heretofore recorded in the culture of the potato. That more than a ton and a quarter, or 42 1-2 bushels, should be grown from one pound of seed is truly marvellous. (Report of Committee.)

My seed is direct from the originator, and my stock is warranted genuine. (Only selected tubers are sent out.)

I refer by permission to the publisher of **THE AMERICAN GARDEN.**

PRICES—Pound, by mail, 75 cts.; peck, by express or freight, \$1.50; bushel, \$5.00.

REASONS WHY Bradley's Superphosphate

Has Maintained its Supremacy for 24 Years.

BECAUSE it has been the constant aim of the manufacturers to make it THE BEST IN THE MARKET.

BECAUSE it contains all the requisite elements of plant-food, derived from sources and combined in proportions, proven by the practical experience of 24 years to best constitute a WELL-BALANCED COMPLETE MANURE, FOR GENERAL USE ON ALL CROPS.

BECAUSE the materials of which it is composed are selected with reference not only to their chemical composition, but especially to THEIR CROP-PRODUCING POWERS, WITHOUT REGARD TO COST.

BECAUSE the greatest attention is given to its manufacture to secure uniform quality and condition, all the raw materials, as well as the manufactured product, being daily analyzed by competent chemists. Thus there is no guess work, EVERYTHING BEING REDUCED TO A SCIENTIFIC BASIS.

BECAUSE its composition is based on no foolish theory, but on those principles of feeding plants which are recognized by the highest authorities at home and abroad as the only practicable and profitable methods of RETURNING TO THE SOIL THOSE ELEMENTS EXHAUSTED BY THE CROPS.

Our patrons, whether agents or farmers, are invited to visit our factories and SEE FOR THEMSELVES HOW OUR FERTILIZERS ARE MADE.

THE WESTERN WORLD

For those seeking Homes or investments in the United States this paper gives more information than can be found in all other papers combined. It gives an account of all Government Lands subject to entry or pre-emption, and steps necessary to secure the same, also an account of all Mineral and Timber Lands, and Lands donated to Rail Roads, or other Public Institutions. For those seeking safe and profitable investments, it gives an account of all State, County, Township, and Municipal Bonds about to be issued, or issued and unsold, it points out openings for employment and business of every kind, in short it is a perfect Cyclopaedia of the boundless resources of wealth in the Western World.

Subscription Price, \$1.00 a Year, or 10 Cents a Copy.

For the benefit of those wishing to inform themselves more fully we are arranging for large Sectional Maps of each State and Territory, by which any piece of land can be located, showing its proximity to Streets, Timber, Rail Roads, Towns, etc. Each map folds in a cloth-bound case for carrying in the pocket and retails at from \$1.00 to \$3.00 each. As fast as we can secure the different States we shall furnish them with a year's subscription to the Western World for \$1.25. At present we can furnish in this way either of the following great states, viz: Illinois, Wisconsin, Minnesota, Dakota, Iowa, Missouri, Kansas, Nebraska, and Colorado. Maps will be sent by mail, postage paid.

Address, The Western World, Chicago, Ill.

SPECIAL OFFER: The Western World (\$1.00), THE AMERICAN GARDEN (\$1.00) and the famous Little Detective Seal (\$3.00), with new beam showing the **COST IN CENTS** of postage on any article placed in the tray, and for weighing anything else. (Total cost \$5.00.) **ALL FOR \$3.00.**

Present subscribers to THE AMERICAN GARDEN can get a neighbor to take THE GARDEN and add \$2.00 for the above combination.
 Address orders to THE AMERICAN GARDEN.

The Greatest Potato in the World!
 Holds 1,391 1-2 Bushels per acre. Beautiful form and unsurpassed quality. The Stock secured at the enormous price of over \$200.00 per barrel.

LINE OTHER POTATOES OF OUR INTRODUCTION, THE GREEN MOUNTAIN WILL FAIRLY SPRING INTO POPULARITY.

GREEN MOUNTAIN POTATO.

This wonderful new potato was raised from seed borne on the Drumore, impregnated with pollen from the Excelsior, and was originated in Vermont. That it is an extraordinary and an exceedingly valuable variety there is not a doubt. In fact, judging from our knowledge of new potatoes, we say it stands without an equal as regards all the essentials of a valuable and profitable variety to grow as a general crop for home or market. Its handsome form, white skin, and large size, recommend it everywhere. The flesh is white and fine-grained, cooks dry and mealy, and is of superior flavor. This is the case when first dug, and they retain their good cooking qualities and keep sound and perfect until the new crop comes again. As a variety to keep for late spring use it has no superior. Vines grow vigorously, foliage deep green, the tubers grow compactly in the hill, which is completely crowded with fine large potatoes; they ripen in August if planted in April and in the important matter of productiveness they are perfectly marvelous, far surpassing all other varieties. This quality, combined as it is with the appearance and good table qualities, makes the Green Mountain the most valuable variety in the country, and it is only the matter of time to make its merits known when it will be sought after by all growers, and will, as fast as sufficient stock can be grown, supplant all other varieties. Read the report from the *Rural New Yorker* Experiment Grounds.

Green Mountain Potato was planted April 7th and the crop was harvested August 27th, the variety therefore being a late intermediate. They were dug under the supervision of E. Williams, Secretary of the New Jersey Horticultural Society, and Chas. L. Jones, of Newark, N. J., who, with the editor of the *Rural New Yorker*, weighed and estimated the yield, which was at the rate of 1,391.50 bushels per acre. * * * There was an average of 11 2/3 to the hill, and an average weight of 5.34 pounds to the hill. They were planted two eyes to the hill, one foot apart, in rows three feet apart. * * * This is the largest yield of potatoes ever raised on these Experiment Grounds. E. S. CARMAN, Editor.

Also from a letter received from the editor of the *Rural New Yorker* under date of December 6th, we quote: "Of all the potatoes we have ever tested, this Green Mountain yields the most. It is an immense yielder!" There probably is no person in the country who is better able to judge of new potatoes than Mr. Carman, and such words as above coming from him, must carry great weight. From our own knowledge of them, we judge them to be the best potato in America, and to secure them we paid the enormous price of \$200 per barrel for the stock, which we control entirely. They cannot be offered by any other party this year, and can only be secured of us on the following

TERMS: Our experience in introducing new Potatoes, Grains, etc., heretofore, has been the benefit. As an illustration, say we sell a farmer a bag of Martin Amber Wheat from which he raises one hundred bushels; now his wheat can be sold for much less than we can afford to sell at and pay our advertising expenses. However, if the party would have asked our price and been protected from competition at a lower price, he could and would have received it. This is what we mean to do in introducing our Green Mountain Potato. We intend to protect ourselves and at the same time make it possible for all who get a start now to make much money out of them during the next few years. They will be largely advertised and will be in large demand for years to come. Our plan is as follows:

Each purchaser of the Green Mountain Potato must agree not to sell said potatoes for seed purposes for a term of three years for a less price than that fixed and sold at by ourselves. The price for each year will be found in our Annual Catalogue of that year. By this arrangement you can ask and receive from parties who will want them, a price which will give you a handsome profit. Besides, all purchasers of this season we will make our special agents in following years to introduce these potatoes and supply them with what they may need at reduced rates. There is no reason why a dollar invested now will not realize you several hundred dollars in the course of a few years; any person can see the force of this argument. The stock of Green Mountain Potatoes is as yet very limited; we have set aside for our own planting less than two barrels, all the balance we shall distribute in lots of one doth's worth, the quantity not to exceed one pound. If the applicants are more numerous than the number of pounds, each party will receive a fraction under this quantity; the distribution will be made April 15th and each party will immediately receive his share by mail. If we receive any orders after April 15th, we will fill them from what we reserve for our own seed. Send on your orders at once and secure a share in the distribution which will prove the best investment you ever made. Price \$1.00 per share. Elegant seed catalogue FREE.

Address, **J. A. EVERITT & CO.,**
 Lock Box 40, Watertown, Northumberland Co., Pa.

MAMMOTH

DEWBERRY

OXALIS.

TEA ROSE.

THE MAMMOTH DEWBERRY.—In this new fruit (which might be called a climbing blackberry) we have the most delicious of all berries, and one of the most ornamental of all climbing vines. They should be trained on a trellis or tied to a stake like grapevines, and in the Spring they produce great masses of large, pure white, sweet-scented flowers, which are followed by clusters of delicious fruit, larger, richer, and far more profuse than blackberries, very juicy and sweet to the core. The fruit is borne in great quantity, and is admitted by all to be the finest of all berries. It is perfectly hardy and does not succor from the roots, but is increased from the tips; like black-cap raspberries. It is sure to succeed in any soil or climate. In market the berries bring a large price. Aside from its value as an ornamental climbing vine, it is the most valuable of all small fruits. Strong plants by mail, post-paid, 40c. each, or for a climbing vine, it is the most valuable of all small fruits. Our new IMPERIAL GERMAN PANSIES have created a sensation and are the floral wonder of the times. Flowers of enormous size, with colors and markings entirely new and of marvelous beauty (see catalogue). They bloom from May to Dec.; always large and profuse through the dry, hot weather of Summer when other sorts fail. Mixed seed of over 50 distinct colors, 25c. per paper. The white is magnificent for cemeteries. As pure white, black, yellow, blue, variegated, &c. 12c. per paper. Our new PRIZE VERBENA and GIANT WHITE SPIRAL MIGNONETTE are magnificent; seed 20c. per paper.

Our new DOUBLE WHITE PERPETUAL FLOWERING VIOLET, the queen of fragrant flowers, a grand novelty. Fine plants, 35c. each, 2 for 60c., 4 for \$1. SPOTTED CALLA—A grand variety, the leaves of which are beautifully spotted with white. The flowers are elegant, being pure white with a black center. Strong bulbs which will flower very soon, 50c. each, 3 for \$1. We can also supply the RESURRECTION PLANT, a great curiosity, at 30c. each. New DOUBLE WHITE VERBENA, a grand variety, the leaves of which are beautifully spotted with white. The flowers are elegant, being pure white with a black center. Strong bulbs which will flower very soon, 50c. each, 3 for \$1. Our SUMMER FLOWERING OXALIS, a grand variety, the leaves of which are beautifully spotted with white. The flowers are elegant, being pure white with a black center. Strong bulbs which will flower very soon, 50c. each, 3 for \$1. Our new PRIZE VERBENA and GIANT WHITE SPIRAL MIGNONETTE are magnificent; seed 20c. per paper. SEEDS, BULBS and PLANTS. New and beautiful Lilies, Anemones, Geraniums, Carnations, Roses, Flower and Vegetable Seeds. Preserve this advertisement; it may not appear again, and remember that our goods have an established reputation and are warranted true. See catalogue for grand novelties.

Address, J. LEWIS CHILDS, Floral, Queens Co., N. Y.

N. B.—Floral is the name of a new post-office recently established in our seed store, near Queens. Remittances can be made in Stamps, Greenbacks, Drafts, P. O. Money Orders or Postal Notes, but all P. O. Money Orders or Notes must be made payable at New York City Post Office. SPECIAL OFFER.—For every dollar's worth of seeds, we will give a free paper of the above Mignonette, Verbena, or White Pansy.

WHITE

THE NIAGARA WHITE GRAPE COMPANY, having decided to offer for sale to the general public, without restriction, a limited number of two-year-old vines of their CELEBRATED WHITE GRAPE NIAGARA, orders will now be received and entered in rotation for vines to be delivered in the spring of 1885, until their stock of vines is exhausted. The merited popularity of this wonderful Grape among fruit lovers throughout the country, has induced unscrupulous persons to attempt a FRAUD in offering to furnish them to their customers at a reduced price, claiming that they are genuine Niagaras. This Company desires, therefore, to inform the public, that it now has, and always has had, the absolute control and possession of all the vines grown from the wood or cuttings of the Niagara up to this time. AND THAT NO OTHER PERSON HAS EVER HAD THE RIGHT TO PROPAGATE IT. Only persons having a certificate of authority from the Company, under the Company's SEAL, will have the right to take orders for or the ability to supply the vines of the NIAGARA, and that every vine furnished by the Company, direct or through their authorized agent, will have securely attached to it a SEAL, plainly stamped with OUR REGISTERED TRADE MARK. Reliable dealers and nurserymen will be supplied upon liberal terms, and furnished with authority to take orders, making satisfactory arrangements with the Company. Local agents wanted in every town throughout the United States and Canada, to sell our Niagara Vines from Company. Circulars and Colored Plates are also furnished by the Company.

NIAGARA

NIAGARA WHITE GRAPE COMPANY, LOCKPORT, New York. GRAPE

VICK'S FLORAL GUIDE

A beautiful work of 150 pages, Colored Plate, and 1000 Illustrations, with descriptions of the best Flowers and Vegetables, prices of Seeds and Plants, and how to grow them. Printed in English and German. Price only 10 cents, which may be deducted from first order. It tells you what to get for the garden, and how to get it instead of running to the grocery at the last moment to buy whatever seeds are left over, meeting with disappointment after weeks of waiting. BUY ONLY VICK'S SEEDS AT HIS QUARTERS. Colored Plate in every issue. Price, \$1.25 a year; five copies for \$5. Specimen numbers 10 cts.; 3 trial copies 25 cts. We will send to one address Vick's Magazine and any one of the following publications at the prices named below—really two magazines at the price of one—Century, \$1.50; Harper's Monthly, \$1.00; St. Nicholas, \$1.50; Good Cheer, \$1.25; or White Awake, \$1.00. JAMES VICK, Rochester, N. Y.

NEW SILVER GERANIUM.

MAD. SALLEROT Endures the sun better than any other silver leaved Geranium. A perfect form for bedding purposes. By mail post paid, six plants for \$1.00. GEO. L. MILLER, Ridgewood Nurseries, Stockton, Ohio. Illustrated catalogue free.

WOODRUFF GRAPE.

This very large and handsome Red Grape is now offered for the first time for sale without restriction. A seedling of Concord, perfectly healthy, and exceedingly profitable. Stock limited. Parties wishing either to propagate or plant for fruit should apply at once to EVART H. SCOTT, ANN ARBOR, MICHIGAN.

The Marlboro Raspberry

With all the other varieties growing here, and with a knowledge of those catalogued throughout the world, we claim that the Marlboro has not an equal in desirable quality. We have invited all interested to come and see it, and neighbors and strangers without a single exception bear us out in the above statement. Interested parties and partisan journals may continue their misrepresentations. We say, come and see its earliness, its hardiness, and its great growth of bush and unequalled size and perfection of all the berries. We also want you to eat it and try its solidity. Part of the crop was sent to Montreal, 450 miles by rail, in good order. First shipment brought 60 cents per quart, wholesale in New York, and rated higher throughout the season than any other variety. Our new seedling grape, the

ULSTER PROLIFIC,

In hardiness, mildew and rosebug proof, and unequalled quality with its great bearing habits, much pleases the most difficult. The refinement of our seedling the

PO'KEEPSIE RED,

Its earliness, growth and productiveness is already known to the country. The high quality of our white grape

Duchess,

Is so generally acknowledged that it no longer needs a description. Vineyardists are now planting it by the thousand. Send for circulars. Our recent hardy seedling blackberry, the Minnewaski, is not yet catalogued or priced, but will be ready next fall.

GREATEST OFFER OF NOVELTIES IN SEEDS

76 CTS. will get you 11 packets of seeds from which you can grow these new, delicious, and rare vegetables and a paper for a year.

A straight proposition to every one of the 30,000 readers of the American Garden. We have arranged at great cost and after much labor, this collection of New Seeds for 1885, accurately described and beautifully illustrated here. The cut is a careful drawing by an experienced artist from photographs of these vegetables. It has been carefully prepared for its size, quality, and perfection.

FOR SEVENTY-SIX CTS. we will send the 11 packets of new seeds, illustrated above, and our monthly paper, "The Farm and Garden," the best garden, floral, and farm paper in America, for 1 year, free by mail. Every subscriber to our paper in time will get us more, and though twice the value is here given in seeds alone, we eventually make a profit. The fact that our advertisement appears in the AMERICAN GARDEN is positive proof that we will do exactly what we promise, and that our seeds are as represented.

WHY PLANT OLD VARIETIES WHEN NEW BLOOD IS MUCH BETTER? Our Perfection Muskmelon has flesh so thick there is scarcely room for the seeds, delicious flavor; very productive—best novelty. Cuban Queen Watermelon—our seed is of the strain from which the 11-pound melon was grown. Unlike most large melons, it is of splendid flavor, with elegant, sweet, crisp heart and thin rind. New Cardinal Tomato, flesh most brilliant red; very for seeds. Solid and wonderfully firm. Mammoth Tipoll Onion, weighs 2 lbs. surpasses all varieties in delicate flavor. Ruby King Pepper, largest grown, 6 inches thick. Elumpee Cabbage, two weeks earlier than any other. Early Genesee Sweet Corn, extra early, large ears. Mammoth Boulogne Pumpkin, new of fine flavor, very large. New Golden Heart Lettuce, extra fine, none better. Pumpkin Squash, best of all for pies, most productive. Scouring Olive, Russet, has no superior, extra early. These ELEVEN PACKETS of Seeds will be delivered free at your post-office, and "The Farm and Garden" sent for Twelve months on receipt of only 76 cts. You will never see it again.

WE CAN ONLY AFFORD TO MAKE YOU THIS OFFER ONCE. (The publishers of this paper have strict orders not to insert it twice. Nor can we alter the prices in any way, as they are prepared in large quantities. REMITTANCES: Some publishers do not accept stamps, hence a number of their subscribers have asked us if we do. We will accept of you. You may send Post-office Note, Order, Registered Letter, Bank Draft, or Express Order, at our risk. Before you lay this paper down, write out and send order. State you are a subscriber, and address plainly. ORDER AT ONCE! The American Garden, and expect to be treated well and address plainly, CHILD BROS. & CO. PUBLISHERS, 946 LIBRARY ST. PHILADELPHIA, PA. Send us 10 orders and \$2.50 and we will send you 100 seeds and 10 papers, and YOUR seeds and paper free.

HOW TO GET IT FREE!

ANY LADY OR GENTLEMAN, BOY OR GIRL, may easily make a few dollars in a few hours by obtaining subscriptions from among acquaintances to the easiest of all publications to canvass for,—one which sells itself,—the new magazine edited by Marion Harland and Dr. Yale, devoted to the care of infants. (It is the only periodical in the world of its kind, and should not be confused with "juvenile" magazines devoted to the amusement of children.)

The New York Tribune has just said of it: "BABYHOOD grows more admirable with every successive number. It is full of good sense and the wisest instruction, which cannot fail to be appreciated by all who have the care of children;" and the Boston Transcript: "This little periodical, we are glad to know, has already met with a large degree of public favor, and when its character and real value come to be more generally known, no mother of a young family will feel like being without it."

There are probably a few subscribers in your locality, already, and the magazine has doubtless gained favorably known. The only reason it has not been brought directly to their notice by a suitable canvasser. If you will make the effort to obtain subscriptions at once, and BABYHOOD will be surprised at your success, and BABYHOOD will remunerate you liberally for the services rendered. Send for terms and sample copy to BABYHOOD, Box 3123, New York.

The Baltimore Telegram says of the subscription price (\$1.50): "We are sure it will be money saved ten times over in any house having the bliss to own a baby."

THE "PLANET JR" HOLLOW STEEL STANDARD HORSE HOE
 NEW
 As lately introduced, has no equal in the world. Its excellent work in the field has distanced that of all competitors. It is in some sections, doing in one passage the work of four or five old-style implements, and in others surpassing the cumbersome and expensive two-horse tools. The "PLANET JR" HAND SEED-DRILLS AND WHEEL HOES are the newest and best, lightest and strongest known. There are 7 distinct tools, each with special merits, no two alike or the same price; all practical and labor-saving. Let no Farmer or Gardener fail to study up during the winter evenings our **ISS. CATALOGUE**, which gives reduced prices, careful and exact engravings of these different machines, and such descriptions as will enable the reader to judge correctly of their merits. Thirty pages and Forty engravings. Free to all. Correspondence solicited.
MANUFACTURERS, 127 and 129 CATHARINE ST., PHILADELPHIA, PA.

"ACME" PULVERIZING HARROW,
Clod Crusher,
and Leveler.
AGENTS WANTED.
 It is the best selling tool on earth.

The "ACME" subjects the soil to the action of a **Steel Crusher and Leveler**, and to the **Cutting, Lifting, Turning** process of **DOUBLE GANGS OF CAST STEEL COULTERS**, the peculiar shape and arrangement of which give **immense cutting power**. Thus the three operations of **crushing lumps, leveling off the ground and thoroughly pulverizing the soil are performed at the same time**. The entire absence of **Spikes or Spring Teeth** avoids pulling up rubbish. It is especially adapted to inverted sod and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that **cuts over the entire surface** of the ground.
 Variety of Sizes, 4 to 15 feet wide. — We deliver free at our distributing depots.
DO NOT BE DECEIVED. Don't let dealers palm off a base imitation or some inferior tool under the assurance that it is better, but **SATISFY OURSELVES BY ORDERING AN "ACME" ON TRIAL.** We will send a Double Gang Acme to any responsible farmer in the United States, and if it does not suit, he may send it back, we paying return freight. We don't ask pay until tried on his own farm.
 Send for Pamphlet containing Thousands of Testimonials from Forty-eight different States and Territories.

"THE HORTICULTURAL DIRECTORY" OF THE UNITED STATES IS NOW READY FOR DELIVERY.

WE have endeavored to compile as perfect a book as possible, and have been over sixteen months engaged therein. The addresses have all been tested, and the book is as accurate and complete as it is possible for human skill and patience to make it. We believe that it will be an invaluable guide for the trade.

PRICE, \$6.00 PER INTERLEAVED COPY.

Please remit amount in Registered Letter, P. O. Order, or Postal Notes, and book will be sent by mail, postage paid; or, by Express, C. O. D., at purchaser's expense.

CHARLES F. EVANS, Editor, Rowlandville Nursery, Station F, PHILADELPHIA, PA.

SUPPLEMENT A. It is the intention to have ready for delivery at the same time as "The Horticultural Directory of the United States," "SUPPLEMENT A," which will be a list giving the names and post-office addresses of the Nurserymen, Florists, Fruitgrowers, and Seedsmen of England, Ireland, Scotland, Wales, and the Channel Islands, comprising in all about two thousand addresses. The Supplement will be issued in pamphlet form, and will be sold to subscribers to the "HORTICULTURAL DIRECTORY" at one dollar (\$1.00) per copy; to non-subscribers at one dollar and fifty cents (\$1.50) per copy, postage paid. The trade must bear in mind that the rate of postage to points covered by the Supplement is only one cent for unsealed envelopes weighing not more than two ounces. The business in Horticulture between the two English-speaking countries is yet in its infancy, but is growing rapidly.

SUPPLEMENT B WILL be issued April 15, 1885, and will comprise the names and addresses of the principal Nurserymen, Italy, Poland, Russia, Saxony, Sweden and Norway, Switzerland, Wurttemberg, Brazil, India, Japan, Australia, New Zealand, and South Africa. Price, same as "Supplement A." Subscriptions and remittances must be made to

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

Extracts from Annual Report by the Director, Prof. S. W. JOHNSON, on Fertilizers during the past year.

On Valuation of Super-Phosphates and Special Crop Manures. IN 1884, SPECIAL CROP MANURES WERE THE CHEAPEST.

Special Crop Manures cost on an average	23	13 per cent. over "valuation."
Super-phosphates " " "	5	" " "
Mapes' Special Crop Manures cost on an average less than		" " "

Extract, page 50.

The Special Manures themselves are, however, good fertilizers, and, on the average, during this year, have furnished plant-food in a somewhat more concentrated form than other Super-phosphates, and at a considerably cheaper rate, although their average ton-cost has been higher. This will appear from the following comparison:

	Average cost.	Average valuation.	Difference.	Percentage difference reckoned on valuation.
Super-phosphates	\$40.73	\$33.13	\$7.60	22.90
Special Manures	49.95	44.20	5.75	13.00

Some Reasons why High Grade Manures are Cheaper to the Farmer than Low Grade Goods.

Extract, page 51.

A further explanation of the more favorable relation of valuation to cost in the case of the Special Manures is, that, pound for pound, they contain more valuable material. The cost of mixing and selling a high grade article can hardly be greater than that of a lower grade. But in the first case, this cost of the preparation of the goods goes further with the farmer than in the latter case. To illustrate:—Suppose we have two lots of fertilizers unmixed. One contains 250 pounds of Muriate of Potash, 250 pounds of Nitrate of Potash, and 600 pounds of plain Super-phosphate, with as much more moisture, sand, peat or plaster, so that the total weight is 2,200 pounds. Its cost is \$19. This we propose to mix and apply to an acre of land. The other lot contains 500 pounds of Muriate, 500 pounds of Nitrate, and 1,200 pounds of Super-phosphate, without any "ballast." It also weighs 2,200 pounds and costs \$38. To sift, pulverize and mix thoroughly the raw materials in each lot, we will assume cost \$6. Since the weight of the two lots is the same, the labor of handling and mixing will not be very unlike.

When the fertilizers are spread on the land, the first lot covers one acre and costs \$19 plus \$6—\$25. The second lot covers two acres and costs \$38 plus \$6—\$44, or \$22 per single acre. Here, then, is a saving of \$3 per acre, and a saving, it is to be noticed, made by buying the highest-priced fertilizer instead of the low-priced one.

The \$25 Goods are the more Expensive, the \$44 Goods are the Cheaper, if both are rationally used. We are not now arguing for Specials as against other Super-phosphates, but for high grade goods, whether Specials or not, as against the more expensive low grade goods.

The Mapes' Special Crop Manures found to be

THE HIGHEST GRADE and CHEAPEST MADE.

Excelling all other brands in strength and in supplying the best forms of plant-food at the least cost.

Comparison of the Leading Brands of Special Crop Manures for year 1884 which have complied with the Connecticut Law.

	Average cost.	Average station value.	Deficiency per ton.
STOCKBRIDGE MANURES.			
Potato (1), Grass (1), Forage (1)	\$46.66	\$35.93	\$10.73
LISTER BROTHERS MANURES.			
Potato (1)	50.00	40.03	9.07

The "Comparison of Special Crop Manures of the same brand" (see pages 52 and 53 of the Official Report) from 1877 to date, show:—

While MAPES' SPECIAL CROP MANURES WERE FULLY UP TO PUBLISHED STANDARD IN 1878, and were THEN THE HIGHEST GRADE Manures made, that they have steadily, WITHOUT AN EXCEPTION, improved in strength each year. A careful study of this Official Report will show that the claims made for the Mapes' Manures can be justly made by no other manufacturers.

For full analysis and composition of the Mapes' Manures see page 2 of the Mapes' pamphlet.

THE MAPES' FORMULA AND PERUVIAN GUANO CO., 158 Front St., New York.

A SUGGESTION TO GARDENERS.

MARKET gardeners on Long Island now rely almost wholly upon fertilizers. It is said that over 5,000 tons are used in this small territory annually. Why? First,—because they are cheaper than manure, although the Long Island farmers are so near New York City that stable manure can be brought to them in boat-loads at a very low price. Secondly,—Fertilizers are more cheaply applied, and produce as large crops of fully as good quality. It seems to them that market gardeners would do well to buy manure only for its mechanical action on the soil and for bottom heat. There are many market gardeners in the vicinity of Boston that are, as the Germans say, "manure-sick." That is to say, they are in that condition in which there is not a sufficient supply of mineral elements to produce a paying crop. To such lands mineral fertilizers or chemicals should be applied, for they correct this condition. Let all market gardeners, therefore, who have not done so, try fertilizers on such lands. In other words, buy fertilizers which are concentrated plant food, for the same reason that grain, which is concentrated animal food, is bought for farm stock. Let the manure hold the same relation in plant food, while chemical fertilizers are concentrated plant food. In each case they are best used together.

Reports on Strawberries, Fruits, Etc., with Stockbridge Manure.

Kennebec Co., Me., CHAS. G. ATKINS.—I planted several hundred young apple-trees on worn-out land, in May, 1881, making no preparation but the spading up of the places in the fall, and no manuring except three cents' worth of Stockbridge Fruit Tree Fertilizer per tree. All lived, and made excellent growth,—from 10 to 30 inches on each twig. I shall use more.

Hillsboro' Co., N. H., G. & H. WHITTAKER.—We have used the Stockbridge Manures on Grass, Peach-trees, and Grape-vines, with good success the past season.

Barnstable Co., Mass., J. S. DILLINGHAM.—I have used your Corn Fertilizer, also Potato and Bean, and am well satisfied with the result. I have also used your Cranberry Dressing for about 3 seasons, and have supplied my neighbors with it. We think it is valuable to make the vines grow and thicken. It helps the fruit and kills the moss.

Bristol Co., Mass., W. O. SWEET.—Having noticed in your pamphlet that Strawberries grown on Stockbridge would stand up better and produce finer berries than when grown on stable manure, I determined to experiment with it, and am well satisfied with the results. In 1879, I raised a good crop of Potatoes of superior quality, using nothing but your Stockbridge Potato Fertilizer. In the spring of 1880, I planted this piece of land—14 rods—to Strawberries. After well pulverizing the soil with a Lad Dow harrow, the plants were set out in April, 1881, making 600 lbs. in all. The variety of Strawberry applied in July following, then another bag in September, and the rest in April, 1881, the plants were set out in April, and the first bag of Strawberry applied in picking, presenting a fine appearance in market, and bringing a better price than the same variety grown on other fertilizer.

Middlesex Co., Mass., H. H. BOARDMAN.—I have used your Stockbridge Fertilizer on Strawberries the past season, with satisfactory results. It is better for that purpose than any manure I know of. Your formula for garden crops pleases me equally well.

Windham Co., Vt., N. MONROE.—Applied 4 bags of your Stockbridge Fertilizer on my Strawberry patch, and the vines look better than when I applied a larger amount of stable manure.

MAY, 1885.

No. 5.

MAY DAY.

At no other time of the year are the changes from one season to another so sharply marked as at this, and, so far as its practical bearings are concerned, May Day indicates to many far more the beginning of an annual cycle than the first of January, occurring, as it does, when vegetation is at rest, and meteorological conditions remain unchanged for weeks. But with the dawn of May, Nature shakes off the last remains of her wintry garments, soon to appear adorned in leafy green and fragrant flowers. The return to new life and activity that surrounds us at every turn, the balmy air we breathe, laden with strange, magical powers, seem to take possession of our whole being, and to transfuse bright hopes, fresh aims and new life through the body and mind.

In our prosaic nineteenth century so many time-honored and beautiful customs of former ages have been discontinued and become forgotten, that to the majority of persons the first of May probably suggests no more than moving and the payment of rent.

Among the ancient Romans the month of May was held as the foremost month of the year, and was dedicated to Jupiter, *Deus Majus*, hence its name. Between April 28th and May 3d elaborate floral festivals were held to his honor and to commemorate the return of flowers. Tennyson's charming poem, the "Queen of May," familiar no doubt to most of our younger readers, recalls the great anxieties of the little maid that she should awake in time to be the "Queen of May."

But it is not children alone that did get up before daylight to be in time for the May festivals, and that do up to the present time, in most European countries, celebrate May Day with all the zest and jollity of former times, though fortunately deprived of its coarser and objectionable features. May parties, excursions and picnics to the budding woods and sunny fields are the order

of the day, in which old and young participate. Nothing, surely, could be more appropriate, more joyful, than thus to greet a bountiful, virgin nature, by welcoming the return of glorious spring.

There is hardly anything that we as a nation are so much in need of as holidays which take us away from the everyday routine of business, and which draw our minds to other channels of thought. "All work and

national out-door family festival at this season of the year, when sunshine, green hills and balmy breezes invite us to leave, if only for a day, the narrow town and village.

TASTE IN HOME SURROUNDING.

Walk, if you will, said James Vick, through the avenues or resident streets of any of our large towns or cities, and carefully note the manner in which grounds are arranged.

Here we see a handsome house with a large lawn, the trees are planted in regular rows, the evergreens are shorn of all their beauty, they are deformed and made to assume shapes stiff and ugly. The walks are all straight, the flower-beds planted with the utmost accuracy may contain real treasures, but the blossoms hardly dare bend where wind blows, and even the Pansies never dream of looking jolly and full of fun. We have not seen a face yet we know. How cold and formal is every member of that family.

Many sumptuous residences impress one in something the same way that a rare gem would, if set in lead, the surroundings so entirely lack harmony with the style of architecture.

Then again you pass dainty homes, homes where carefully trained vines clamber over the piazzas and porches, where winding walks tempt you to enter and enjoy their graceful curves, where Sweet Peas and Eglantine Roses look happy and contented. Exquisite taste is manifested in the arrangement of buds and shrubs, and we feel sure intelligence, peace and beauty reign within the closed

doors. Rules may be given, plans drawn, rare plants selected, but good taste must be used to secure fine effect.

I have moved into the city, and have only a small yard, but your paper is such a welcome visitor that I cannot do without it.—Miss Isa Bell, Baltimore Co., Md.

It is No. 1 in every way.—Davison Greenawald, Franklin Co., Pa.

The fields with daisies are besprent
As white as flakes of snow,
And from the whispering woods are sent
Joy-murmurs soft and low.

The tiny brook, that lay in trance
Beneath the North King's spell,
Once more upon its way doth dance,
Its happiness to tell,
And with a kindly touch to lend
A little timely aid
To many a dear half-famished friend
In valley and in glade.

no play" does not only make dull boys, but dull men and dull women. A properly arranged May festival for old and young would be a bright occasion to look forward to, and, when once established, would be enjoyed by all. Some of the States have instituted "Arbor Day," which is an excellent idea that partly serves the purpose above mentioned. Whatever we may call the day, we need a

The Vegetable Garden.

SEASONABLE HINTS.

In deciding upon the location of a garden, character of the soil, natural drainage, exposure to the sun, are important points to be considered, but another essential consideration, which is frequently lost sight of, is that of where the growing crops are most likely to receive the best care. An out-of-the-way garden, however favorable to the growth of vegetables, will, naturally, not receive as frequent attention as one more conveniently situated, and constantly under the eye of the owner.

Although good seeds, fertilizers, favorable soil, etc., are important factors in successful gardening, all these are of little avail when not combined with thorough and frequent culture. In fact, if we were to arrange the requirements for success in the order of their importance, we should place perfect cultivation first on the list. Judicious and liberal cultivation will often produce satisfactory results under most unfavorable conditions, while without it everything else goes for but little.

It is for this reason that we repeat the advice given before to our readers, to beware of undertaking too much. There is nothing more disheartening, more depressing, than the sight of a garden that has grown beyond the bounds of our control. It is like a flood breaking the dam which held the waters in check, subject to our wishes, that when once released sweeps everything before it, and against which all our attempts to stem it prove futile.

If one has more land than he feels sure to be able to till well, it is best to seed it with grass or Clover, or some other green manure crop. There is no better way to regenerate old garden ground. By keeping alternate parts in grass for a few years the soil becomes sufficiently supplied with vegetable matter, the most frequent desideratum in old gardens.

Sowing Seeds.—It is worse than useless to put seeds in the ground before it is dry and friable, especially the more tender kinds.

Seeds sown early should not be covered as much as those sown later in the season. For the first crop of Peas, for instance, three inches is preferable to a greater depth, while for those planted in June or July a covering of six inches is none too much, especially in light soils.

Radishes. With few vegetables is the manner in which they are grown of as much importance as with the Radish. No matter what the variety, if it is not grown rapidly and in proper soil, it will be harsh and tough.

To raise tender and crisp Radishes the ground must be deep, rich, and contain a liberal portion of decayed vegetable matter, together with some sand. For an early crop the situation must be well-sheltered and have a sunny exposure. In dry weather water should be given freely.

Market-gardeners raise them as an auxiliary crop in rows with Beets, Carrots, etc. The seed, which is sown thinly together with the main crop, comes up quickly, and the Radishes are fit for use, and pulled, before they interfere with the other plants.

LETTUCE CULTURE.

Lettuce seeds are so very fine—numbering nearly 30,000 to the ounce—that they are generally sown too thick, and although plants thus crowded may gain a foothold and furnish a supply of salad, they lack the crispness and rich, nutty flavor of well grown heads that have been given plenty of room for full development and quick growth.

The usual method practiced formerly, and followed to some extent now among local gardeners, is to sow the seed for the spring supply in the open ground in September, and after two or three weeks to prick the young plants into cold frames for wintering over, and in the spring to transplant to the forcing pit or open ground. Although plants thus grown are somewhat hardier than without this process no one need take so much pains for an early spring supply. The plants can be started in the hot-bed, the window, or sown early in the open ground and then transplanted separately, or between early Cabbage plants, where they will be out of the way before the Cabbages dispute their claim to the ground. Given plenty of room 15 to 20 inches each way and a fair chance in rich, loamy soil in which Lettuce delights, our best sorts will grow heads of such size and quality as to astonish those who have never

THE OAK-LEAVED LETTUCE.

eaten it in its perfection. Give Lettuce a little extra attention and you will be both astonished and gratified with the results.

There are many excellent and distinct varieties, each particular one having its admirers. Some sorts are decidedly ornamental in appearance. The Green Fringed, for instance, is an ornament wherever grown and is of splendid quality. Hanson and Curled India are very fine, but my favorite for outdoor-culture is the Stonehead Golden Yellow, which will form solid heads of large size, very crisp and desirable in every particular. The Oak-leaved Lettuce, one of the novelties of the season, is of most attractive appearance. It does not form very solid heads, but as it is slow in running to seed, is of special value for summer cultivation.

W. H. RAND.

HOW LONG WILL SEEDS LIVE?

The question of the vitality of seeds is a practical one that presents itself to the gardener and farmer, as each seed-time returns. With a stock on hand he does not wish to purchase more seeds if those he has are good, yet he cannot afford to run any risks, as it would be poor economy to void a little outlay for seeds, upon the germinating and other powers of which his season's success in the growing of crops depends. A ripe and perfect seed is a well-protected,

dormant, living plant—as much so as the bear or woodchuck which has rolled himself into a snug ball, and is passing the long, cold winter in inactivity and seeming lifelessness is a living animal. Warmth and other conditions will bring the plantlet as well as the bear from the dormant state, and the functions of nutrition and reproduction will then hold sway. If the winter should be indefinitely prolonged the time would come when the sluggish life of the hibernating animal would cease—the vital spark would go out because of the lack of any more fuel to burn.

So with the seed, it is to be supposed there is a constant though slow combustion, or destruction of substance, going on, which in time exhausts the vitality of the seed. We may see no difference between the living seed and the one that is dead, and the test of applying the conditions for growth decides the question. Whatever may be the real cause of death in seeds, the fact remains, that in the majority of kinds after a few years at most the seeds die. Fresh seeds should therefore be sown, as old ones are either dead, or, if alive, will generally produce plants with vigor impaired.

There have been many experiments to determine the average duration of the life of some of our most common seeds. For example, out of 100 grains of Wheat, kept one year, 96 grew; out of the same number kept two years 84 grew; of three years, 60 grew; of four years, 43 grew; after six years only six plants were obtained. Those kept for seven, eight, nine and ten years were all dead. Very much the same results obtained with tested grains of Rye. Oats and Barley will keep for eight years without a decrease in the per cent of living seeds.

The so-called "Mammy Wheat" which attracted so much attention several years ago passed through so many hands before being planted that even some grains of Indian Corn were found in it. All scientific men agree that the story is a hoax, and even if the grain had been preserved the life would have gone out hundreds of years ago.

Much work on the vitality of seeds has been done by a committee appointed for the purpose by the British Association for the Advancement of Science. It experimented on 361 species belonging to 288 genera and 71 different natural orders, or families of plants. Only 33 genera retained their vitality over two years; only 22 genera over 20 years, and only two genera over 30 years.

The vitality of seeds depends somewhat upon the manner in which they are cured. They should be well dried and kept so. Seeds in large bins may "heat" and even germinate when they are killed, just as in the case of the malt grains. Seeds will withstand severe cold much better than great heat. Seeds that have been exposed to the low temperature of the polar regions and even a still more extreme cold by artificial means have come out with their vitality seemingly unimpaired.

Any heat that will cook, so to speak, the seed destroys its life. A seed will withstand a much higher dry heat than when placed in a liquid. Spores of some Fungus will live after being boiled in water for some time; but this is exceptional, even among these low forms of plants.

B. D. HALSTED.

HEELING IN VEGETABLE PLANTS.

Plants ordered from a distance are not always received at a favorable day for planting, and on the treatment they receive between the time of arrival and planting depends, not unfrequently, their future success. If the day happens to be a damp or cloudy one, they may be planted out at once, but if the weather is dry and sunny, a safer plan is to heel in the plants carefully in a damp and shady place until a more favorable day occurs. It is dampness in the atmosphere—not in the soil—that is most important at the time of planting.

SALSIFY.

This root, commonly called Oyster-plant, is of very easy cultivation and should be in every well-managed garden. It is a hardy biennial, maturing late in the fall of the first year, can be left in the ground in safety, and throws up the seed stalk the following season. A large bud and a purple blossom mature a pod that opens much like a Thistle, full of long, club-shaped seeds. The English sparrows carry these off as fast as they open sufficiently, and the seed has therefore to be gathered every day, to save it. These abominable birds carry off my Lettuce seed in the same way. I have not found the seed to germinate well the second year, although some claim vitality for it for four years.

The seed planted early in the spring, at the time of the Onion or Carrot, will be sure to sprout. I sow rather thin, as it is difficult to pull up the young plants after once taking root; sown in rows one foot apart it is easily kept clean, as it has an upright habit of growth. The ground needs to be worked deep, and made rich for it; the normal size of the roots is about one inch in diameter. I have had them larger; but it is unusual. They need the whole season to perfect their growth, but can be eaten as soon as the roots are big enough to scrape for boiling.

I usually mow the tops before hard frosts sap the vitality of the roots. A short top will spring up afterwards, that is left on at the time of digging. For marketing, the roots should be straight as in the illustration; but the side shoots have often to be removed to gain this appearance; this should be done at the time of digging, as it makes them more convenient to handle subsequently. I pack them close together in soil on the cellar floor, 4,000 roots in a space of 36 feet square. They are held in an upright position by the earth, and closely surrounded by it; the tops remain green, and some growth is made, while the root will keep fresh till May. If these conditions are not provided and the roots protected they will wilt very rapidly. The principal danger is from rot late in the season. I find them a profitable market crop as they can be grown quite near together if they do not touch each other, but a hard soil makes them "straggly."

In preparing the roots for the table, one needs to use some care, as the milky juice of the plant stains the hands like the Dandelion. To avoid this and the discoloring the roots, which will turn black if left exposed to air after scraping, they should be placed in the water in which they are to be boiled, immediately after scraping. They may be prepared in various ways, and when prop-

erly cooked, the oyster flavor in them is strongly marked. As a vegetable they are far superior to Parsnips; but I have noticed that at the North they are not as much appreciated as among southern people, and by

BUNCH OF SALSIFY.

French and Germans.

The Scorzoner, a black-skinned variety, having a seed shaped like a wooden shoe-peg, differs in some respects from the Salsify. The leaf is lighter green, the root is more brittle, has a different flavor, does not grow in as good shape as the Salsify, and will not keep as well. Their uses are the same, but for general cultivation the Salsify gives more satisfaction than the black-rooted variety, and will on the whole grow to a larger size.

W. H. BULL.

THE WONDER OF FRANCE BEAN.

This novelty represents a peculiar tribe of Beans with seeds of bright green color. It is immensely productive and very early, the leaves falling off just before the maturity of

WONDER OF FRANCE BEAN.

the pods, thus causing quick ripening. It makes a very good string bean, but its main use is as a shell bean. When cooked it retains its attractive color, and is of a rich, delicate flavor, similar to the Lima Bean.

FIRMING THE SOIL.

Small, fine seeds should always be covered very lightly, and the best way to accomplish this is to scatter them evenly over the smooth surface, and then sprinkle fine soil over them just enough to cover them, and press down with the hand, or a light hoe. This will greatly facilitate their germination, as in order to sprout and grow, it is absolutely necessary that each seed should be in immediate contact with the soil. The omission of this firming of the soil is a more frequent cause of failure than the want of vitality in the seeds themselves.

Seeds should never be sown when the ground is wet, much less should the soil be pressed down when in this condition, else it will surely bake after a few dry, warm days and the tiny sprouts will not be able to force their way through it, and the seeds will rot. This applies especially to stiff, clayey soils, which should not be firmed unless they are dry and mellowed.

The best advantages of firming are secured in hot weather, when the soil is so dry that seeds placed in it loosely would not germinate. When the ground is dry and hot even the heaviest clay soils will bear any amount of firming.

N. J. SHEPHERD.

FRESH SPROUTS.

A good wheel-hoe is as much superior to the common hoe for cultivating a garden, as is the mowing-machine to the sickle in the hay-field.

Size and plumpness in seeds furnish no more reliable criterion as to their intrinsic quality than they do with men and women. It's the blood that tells.

A farmer in Salem County, N. J., last season raised 83 tons of Tomatoes on six acres of land. The crop was sold to the canning establishment for \$7 per ton.

At a recent meeting of Maryland farmers, the general opinion was in favor of northern-grown seed Potatoes, as better adapted for that latitude than home-grown ones. The Beauty of Hebron was considered the most profitable variety.

Bran is highly recommended by several intelligent farmers, as a manure for Potatoes. Waldo F. Brown considers it cheap for this purpose, at \$15 per ton. Damaged bran, which is just as good as the best, can often be bought for \$5 per ton.

Frank L. Burt believes that the farmers of New England can raise Corn at less cost than they can buy it from the West. From an acre of land to which were applied 600 pounds of Stockbridge Corn Fertilizer he has raised 103 bushels of shelled Corn. This is what a boy can do; farmer Burt is only eighteen years old.

W. H. Bull is of the opinion that where the right conditions exist a man can support a family of six persons and sometimes more, on eight acres, and do it year after year. [Eight acres would seem a large farm to some of the New Jersey market gardeners who support themselves and their families on one and two acres of land.—Ed.]

The Fruit Garden.

SEASONABLE HINTS.

Considerable planting will, on account of the lateness of the season, have to be postponed till this month, and some of the hints given for April will be found applicable now. But it should be borne in mind that the later in the season trees are planted the more important it becomes to prune severely, and to give careful attention to every detail.

Strawberries may be successfully planted when in full bloom, even provided all the blossoms and buds are pinched off and proper care is given them. Between the many methods of planting recommended, the novice is often left in doubt which one to adopt, but if he will examine them discriminatingly he will find that the principles which underlie all successful systems are the same:

Good soil of liberal fertility, deeply and thoroughly worked, so that it is mellow and friable at the time of planting.

Young and thrifty plants of good pedigree, and of varieties adapted to the soil and climate.

Scrupulous care in protecting the roots, at all times, against exposure to sun, winds, and air.

Placing the roots in as natural a position as possible, spreading them out straight at full length without turning them over. If the roots are thought too long, cut them off, but never bend their ends over.

Never to place them deeper in the ground than they stood in the propagating bed. The heart of the plant must be free to light and air, and not covered with soil.

To cover every part of the roots with fine soil to be pressed down firmly; then level with soil, leaving it loose on the surface.

In very dry weather water should be given in the evening, but unless one is prepared to soak the ground thoroughly it is better not to give any water at all.

Other points, of minor importance, might be mentioned, but if these directions are carefully and judiciously followed, not one plant in a hundred need be lost.

The *Curculio* Worm is becoming so destructive in some localities as to discourage the planting of Currants and Gooseberries, and yet there are few as infallible specifics as the one we have for this pest. A teaspoonful of powdered White Hellebore, dissolved in two gallons of water and applied to the foliage on the first appearance of the worms, is a sure remedy, though it usually needs applying a second time later in the season.

Old Strawberry Beds. It is generally easier, and cheaper, and better in many respects to plant a new bed than to clean and keep in order an old one. Many successful growers never take more than one crop from their plants, that is, plants set out now will bear a full crop next year, after which they are turned under.

Peach-Trees should be examined again for borers that may have escaped previous notice. The larvae are easily detected by the exudation of gum at the opening of their burrows. By removing some soil around the base of the stem they may be found easily and dug out, which is the most effectual remedy against this insidious pest.

RE-PLANTING FRUIT TREES.

In many instances, fruit trees fail to grow luxuriantly, even when the soil is kept clean and mellow around them. Sometimes a tree will send out only an inch or two of growth each season; whereas no fruit culturist should be satisfied with a growth, on every side of the tree top, of less than one foot.

When a young tree fails to grow satisfactorily, the lack of growth may be remedied sometimes by re-planting, sometimes by cutting back, and sometimes by mulching the ground around it. If the tree does not appear to be firmly rooted, the body does not enlarge as much as it should, and the yearly growth is short and small, I have always found it advantageous to dig up such trees, about the time the buds begin to expand, and re-plant them. Should roots be few and weak, it will be found best to cut the tops back severely; and in many instances to remove the entire tops, leaving nothing but a bare stub.

Sometimes dwarf Pear-trees on Quince roots cannot be made to grow luxuriantly. When they are not firmly rooted, they had better be dug up, and set out again in the same place. But when such trees are re-planted, the ground should be dug up to a depth of at least 20 inches, over an area of four or five feet in diameter. Then the tree should be placed so deep that the junction of the Quince-wood and the Pear-wood will be at least three or four inches below the surface of the ground.

Just before such trees are placed in position, with a sharp knife gouge out pieces of bark about as large in diameter as a ten-cent piece, on the bulb of the Pear-wood. This cutting into the bark, at that point, will induce the starting of numerous roots all around the stem of the tree. The soil should be packed firmly around the stem of such, as close contact of the earth with the tree is exceedingly important. Roots will then be thrown out from the Pear-wood; and if the soil be kept clean and mellow, the tree will take a new start, grow luxuriantly, and bear abundant crops. After the lapse of a few seasons the Quince-wood will decay; and the tree will be sustained solely by Pear-roots. When re-planting such trees, it is advisable to mix about a peck of slacked lime and a half bushel of ashes with the surrounding soil.

When Pear-trees standing in grass ground fail to make a satisfactory growth, it will avail but little, if anything, to dig them up and plant a little deeper, unless the ground around them is kept free from weeds and grass. Young Pear-trees will not thrive satisfactorily on grass ground unless the soil is unusually fertile, having a somewhat porous subsoil beneath it. It will be found an excellent practice to spread some mulching material around each tree, to subdue grass and weeds. Coal ashes answers this purpose as well as anything else. S. E. T.

EFFECT OF FERTILIZERS ON STRAWBERRIES.

A series of experiments made by J. B. Rogers, leads him to the conclusion that the nutriment given to Strawberry plants does not affect the vegetative and reproductive organs of different varieties alike. Although little or no attention is given to these influences in ordinary Strawberry culture, he

found them so plainly marked as to establish three separate classes, based upon this action of manures.

1.—Those in which the highest type of vegetative, flower and fruit growth would seem to result from mixed barnyard manures, or commercial fertilizers containing but little potash. Prino, Sharpless, Bidwell, Triomphe de Gand are representatives of this class.

2.—Those in which the highest type of vegetative, flower and fruit growth would seem to result from the use of potash, in addition to the fertilizers of the first class. Among these are Miner and Seth Boyden.

3.—Those which seem to be indifferent, and are possessed of a remarkable resistance to the evil effects of varied fertilizers. The blossoms remain very constant but the texture of the fruit varies greatly, as for instance in the Charles Downing and in the Cumberland.

RENOVATING FRUIT TREES.

An incident which occurred some years ago in my garden taught me an easy way to infuse new life and vigor into young trees of sluggish growth.

A cat was accustomed to scratch on the body of a small Pear-tree, and before I was aware of it the entire bark around the tree, for about a foot up, was dry and dead. Considering the chances for the tree's survival very small, at best, I sawed off the stem just below the lacerated bark. This was done about the middle of May, and the wound was thickly covered with grafting wax.

The first season a new stem of over five feet grew from the stump, and four years afterward the tree had reached double the size and bore twice the amount of fruit of any of the other trees planted at the same time in the same field.

Profiting by this experience, I have since that time never hesitated to saw off every limb from bark-bound and crooked-branched unsatisfactory and slow-growing trees. New sprouts will start at once, the trees will regain new life, grow luxuriantly, and eventually form large, symmetrical tops. Of course where there is a deficiency in the soil, or where standing water settles around the roots, neither replanting nor pruning can do any good before the fundamental causes are removed. ORANGE.

SELECTION OF PEARS.

The following Pears are recommended by Josiah Hoopes in the N. Y. Tribune as proving generally satisfactory throughout the Middle States. Summer Doyenne for very early; very handsome and very good. Bartlett, which no home can afford to dispense with, and always reliable. The old time-honored Seckel, as the standard of perfection, but inclined to overbear. Anjou, for a strong, healthy grower, and other good qualities. Lawrence we cannot dispense with as a delicious, handsome fruit for the Christmas holidays, and last, the newest of all, Rattler, because for twenty years it has proven not only reliable in several sections, but the trees among the healthiest of the entire list. Planters should bear in mind, however, that all such lists as the above are only suggestive, and that no thoroughly reliable set of fruits can be named, suited to all localities, with our varying soils and climates.

HOW TO CROSS-FERTILIZE FRUITS.

It is often remarked that we have too many varieties. So we have, but surely, we have not too many good varieties. Our Baldwin Apple and Bartlett Pear are far too few. Until we have so many such varieties that all the delicious fruits of our land are yielded in such abundance that even the shiftily laboring man shall know no lack, we have not enough.

Cross-fertilization of varieties offers the shortest and surest means of securing improvement. The principles that apply in stock breeding apply as well to plants. By crossing two varieties, each of which has one or more valuable qualities highly developed,

FIG. 1. CROSS SECTION OF PEAR BLOSSOM.

we may hope to obtain a variety combining the desirable characters of both.

It is an easy matter to select varieties that have one or two excellent qualities. For example, the Crescent Strawberry possesses great productiveness and is sufficiently firm for market purposes, but it is lacking in size and quality. Hervey Davis, on the other hand, has size and quality but is lacking in firmness and productiveness. By crossing these, we may hope to obtain a new variety possessing the good qualities of both.

There are two ways of cross-fertilizing varieties. In one, which may be called the chance method, the varieties intended as parents are grown in close proximity, so that a portion of the flowers will become crossed in the natural process of fertilization. It is a loose method, though it cannot be denied that excellent results have often been obtained by it. It was by this method that Prof. Kirtland produced many of his improved varieties of Cherries. It has the advantage of extreme simplicity, but also the disadvantage that the grower is obliged to raise many uncrossed seedlings, as he has no means of knowing what flowers have or have not been crossed. It has the further objections, that the grower can never be sure of the parents of his new variety and that it can be practiced only with varieties that are growing very near together.

The second, which may be called the scientific method, requires considerable skill and patience on the part of the grower, but it avoids the uncertainties of the chance method, while it may be practiced between two varieties growing an indefinite distance apart, even many miles.

To practice the chance method one scarcely needs other directions than the hint already given. The scientific method, however, requires some slight botanical knowledge on the part of the operator.

The reproductive organs of a plant consist of the stamens and pistils. In fig. 1, which is a cross section of the blossom of the Pear, the pistils are the long organs that rise

from the center, while the shorter ones about these are the stamens.

Fig. 2 is a cross-section of the Strawberry blossom. Here the stamens and pistils grow out of the receptacle, the central part, which is the future berry. The stamens are much larger and more prominent than the pistils. The swollen part at the top of the stamen, called the anther, contains a fine dust, a portion of which when mature must be deposited upon the stigma—the terminus of the pistil—or a seed cannot be formed. A pistil that receives pollen from the stamens of the same flower is said to be self-fertilized. When it receives pollen from another flower it is said to be cross-fertilized. When the pistil of one variety is fertilized with pollen from another, the seed which follows, when planted, produces what is called a cross or hybrid and usually illustrates some of the characters of both parents to a greater or less degree.

It is evident that if we desire to cross-fertilize a flower we must first prevent the pistil from being fertilized with pollen from the same flower. It is evident, also, that if we are to be sure that the pistil is fertilized with pollen of the variety that we desire to be crossed with it, we must prevent the entrance of all other pollen. In order to effect this, it is best to remove the stamens just before the flower is ready to open its petals, and then enclose it in a paper bag.

Choose a flower that is nearly ready to open and with a pair of fine pointed tweezers fold back the petals and remove the anthers, taking care not to injure the pistil in any way. If desired the petals may be removed entirely without detriment to the reproductive organs. Then slip a light paper bag over the prepared flower and tie it about the stem. The next day, or at longest, the second day after, choose a flower from the other variety to be used as a parent, upon which the pollen is mature, and after carefully removing the bag, deposit a portion of the pollen upon the stigma or top of the pistil of the prepared flower.

If a stamen is mature, a little of the pollen will usually adhere to the finger when the anther is touched. To apply the pollen the

FIG. 3. GRAPE BLOSSOM.

stamens may be carefully rubbed directly against the stigma, or a camel's hair brush may first be gently rubbed upon the anthers and then upon the stigma. I consider the first method preferable when it can be used; it is well, also, to wet the stigma by depositing a minute drop of water upon it with the tweezers before applying the pollen, to aid the latter in adhering. Having applied the pollen, replace the paper bag.

As the stigma may not be in a proper condition to assimilate the pollen at the first application, it is well to apply more pollen the following day. At the end of a week the following day. At the end of a week the following day. At the end of a week the following day. At the end of a week the following day.

of course, necessary to carefully label all crossed fruits for identification.

With strictly pistillate varieties of the Strawberry, that is, those which form no perfect stamen, of course it is unnecessary to remove the anthers, though it is important to enclose the blossoms in paper bags before the petals open, to avoid impregnation with other pollen.

With the Grape, the blossom of which is illustrated in fig. 3, artificial crossing is more difficult than with the larger fruits, owing to the smallness of the flowers. In the blossoms of this fruit the petals open from below upwards. A represents a blossom in which the petals are opening, and b the same after they have fallen. The pistil is the large, fleshy organ shown in the center of b, surrounded by the much smaller stamens. In the Grape blossom, it is important to remove the stamens before the petals begin to spread at the bottom, as self-fertilization often takes place before they are fully open.

FIG. 2. CROSS SECTION OF STRAWBERRY BLOSSOM.

“E.L.M.”

SHORT CUTTINGS.

Summer pruning Grape-vines is thought to be productive of mildew.

Chas. A. Green is of the opinion that it does not injure Apples to become frozen if they are not molested and thaw slowly and naturally.

Dr. Hoskins of Vermont has well said that very few know the productiveness of the Strawberry under good cultivation.

Grafting Grape-vines is not, as one of our readers suggests, “a new-fangled idea,” but was practiced by the ancient Romans 2,000 years ago with as much, if not more, skill and success than it is done to-day.

California's first attempts at Raisin production were made 19 years ago. The following year about 1500 boxes were made, and the industry has rapidly progressed. Ten years ago the crop amounted to about 40,000 boxes. This year it is estimated at 200,000 boxes.

The first prize at the New Orleans World's Fair for the best and largest collection of Apples, not exceeding two hundred varieties, by any horticultural society in the northern district, was awarded to the Wisconsin State Horticultural Society, and in the southern district to the Missouri Horticultural Society.

Notwithstanding the very cold weather of the past winter, Oranges and Bananas offered in our markets were in better condition than in former years. The loss of many thousands of dollars has taught the steamship companies that it does not pay to throw cargoes of southern fruits on the piers on arrival, regardless of the temperature.

The Flower Garden.

MAY.

How softly comes the breath of bloom
From quiet garden closes!
And, blended in a rare perfume,
The royal scent of Roses!
How tender is the touch of May
While gentle winds are blowing,
And in a sweet, yet silent way
All sylvan things are growing!

How brilliant is the morning dew
Amid the fields of Clover!
Beneath a stainless arch of blue
The mock-bird is a rover;
His songs are echoed o'er the hills,—
Their boon of music bringing,—
Till all the land with wonder fills
To hear his rapturous singing!

How gracious is the light that gleams
Across the dancing billows,—
Or with a chastened splendor beams
Above the drooping Willows!
How fair are May's benignant feet
O'er rugged vales and mountains,—
And how her magic pulses beat
Beside the brooks and fountains!

What sudden fervor thrills her blood,—
Through grove or garden straying,—
To linger o'er some tardy bud,
And chide its long delaying!
What pure contentment fills her breast,
Through thick-leaved forests roaming,
To find the peaceful birds at rest
Beneath the dews of gloaming!

What month so musical and bright,
So rife with vernal glory,—
All garmented in air and light,
Like some Arcadian story!—
Oh! fragrant is the breath of May
In tranquil garden closes,—
And soft yet regal is her sway
Among the spring-tide Roses!

—William H. Hayne in *Good Cheer*.

SEASONABLE HINTS.

At this season of preparing and laying out flower-beds, a bit of our last year's experience may perhaps serve as a seasonable hint, especially to amateurs.

Intending to arrange a mixed flower border, four feet wide, by 200 feet in length, in a most unpromising situation, with a cold, heavy soil that had not received any fertilizers in several years, we spaded the ground deeply in the fall of 1883. It was then covered with a coat of three inches of fresh stable manure, and over this was spread a layer of raw manure, thick enough to cover the manure completely. During winter, sifted coal ashes as they are taken from the furnace room were spread over this to a depth of about two inches.

In the spring following, the appearance of the prospective flower-bed was anything but encouraging. As soon as the ground was dry enough it was spaded with a fork, mixing the different strata as much as possible. Two additional spadings were given, at intervals of a few weeks, before sowing and planting, which was not done before June.

As the result of all this preparation the ground remained as mellow and uniformly moist throughout the season as could be desired, and the healthy growth and luxuriance of the hundreds of different plants that grew in it we have never seen equaled.

That much of this success was due to the coal ashes cannot be doubted, as the adjoining ground, treated exactly alike, less the ashes, gave far inferior results.

THE GLADIOLUS.

We have gorgeous flowers, like the Dahlia, which make up in vivid colors what they lack in delicacy; flowers to be admired at a distance rather than close by; then we have flowers of the utmost delicacy of texture and of great beauty of color, like the Iris, which comes early in the season, and vanishes suddenly. Occupying a middle ground is the Gladiolus, a flower with delicate petals and yet vivid enough to make even a Dahlia envious. It is as beautiful as the Iris, and more easily grown than the Dahlia, and is one of the most effective flowers that we have for the garden.

It is not necessary to start it into growth in the house. Wait till Corn-planting season comes. Then dig up the earth where you want it to grow to the depth of a foot and a half. Make it rich by adding some thoroughly rotted manure from the cow-yard. Mix the earth and manure well together, and if it does not seem light, add some sand. The Gladiolus does not like a heavy soil to grow in. Plant the bulbs about four inches beneath the surface. I would advise you to plant at least half a dozen in a clump. The effect will be much finer where there is a large number of stalks than where there are few, and as the bulbs do not often send up more than two or three stalks it is necessary to plant several bulbs together if you would produce much strong effect.

As soon as the blossom-stalks begin to shoot up, set some neat stakes among them, to tie the stalks to later, for they will be top-heavy when the buds begin to expand, and a wind often breaks them down. Paint the stakes green, if convenient, for they will be inconspicuous, and you want nothing to draw attention away from your flowers.

The rarer varieties of Gladiolus are very expensive, some of the newest ones being listed at six dollars in the catalogues of our most extensive growers. Now few of us can afford six-dollar bulbs for our little gardens, but we can have others in the place of these costly ones almost, if not quite, as beautiful, for little money. There are dozens of very beautiful varieties offered at ten and fifteen cents, and for twenty-five and thirty cents you can get some in most exquisite shades. If you do not care for named varieties, you can get mixed bulbs at 75 cents and \$1 per dozen which will afford you excellent satisfaction, and as many of them are seedlings which have not bloomed, you stand a chance of getting some very choice new varieties. You will probably be just as well pleased with these mixed collections as you would be with selected named varieties.

The Gladiolus ranges through red and all its shades,—pink, scarlet, crimson and maroon, and we have it in purple, orange, pale yellow and white. Often a flower combines two or three of these colors, in different shades and markings, and the effect is superb. The flowers are borne on one side of a long spike, and are somewhat like the Anemones in shape. They are wonderfully delicate in texture. There is nothing coarse about them, not even among the very poorest of the many varieties.

It is a most useful plant for furnishing flowers for vases, in the house. The long stalks are invested with a dignity and grace

second only to that of the Lily. Combine them with some pleasing green, which this plant does not furnish for such uses, and you can have no finer ornament for your rooms. The undeveloped buds grow and develop after cutting, if the water is kept fresh.

EBEN E. REXFORD.

CARNATIONS.

The present perfection of the Carnation, said C. M. Atkinson before the Massachusetts Horticultural Society, is the result of long and patient industry. At the beginning of the eighteenth century it numbered between five and six hundred varieties. Throughout the civilized world it is an especial favorite for its simple and graceful beauty, and above all for its delicious fragrance. In Europe it is universally cultivated in pots, but that method is totally unsuitable here. Good, deep garden soil (yellow loam is preferable) enriched with thoroughly rotted cow manure, some leaf-mould, and, if the soil is too adhesive, some sand, are requisite.

Dig deep and thoroughly, and when the weather is fairly settled, set out the plants, nine inches by twelve apart; stir the surface frequently, and as soon as they begin to throw up their flower stems remove all but one, which tie to a neat stake. The weather about the time of flowering is usually bright and hot, thus prematurely hastening the development of the flowers. An evening visit with the water pot, sprinkling on and around the plants, but not over the flowers, is beneficial. Shade is necessary in the hottest part of the day. For the real amateur, cotton cloth, attached to a roller and fixed on a neat skeleton framework so as to let up and down, is the thing. Second-hand fishing nets, or seines, stretched double over stakes sufficiently high to walk under, answer very well, and need not be moved until the bloom is over. In Europe they display six or eight flowers, supported by a stake, but the speaker likes a good mass rather than a few.

As soon as the plants are ready for layering it should be done, thus obtaining strong plants by the middle or end of September, when they should be transferred to their winter quarters. For this purpose a bed should be made of the size of the cold frame, and the plants set thickly in it. By the end of November strew two or three inches of dry tan, or, what is preferable, Pine needles, among them, put on the frame, place the sashes over them, but give all possible air, excluding nothing but heavy rains, snow and extreme frost, and when May comes round again transfer the plants to more agreeable and attractive quarters.

TUBEROSES.

Many bulbs are lost every year by being planted out too early. The Tuberoso is a native of tropical East India and cannot thrive in our climate except in hot weather. In this latitude it is not safe to plant out-beds before June, but by starting the bulbs in pots in a hot-bed or warm room, and transplanting to the open ground in June, they may be had in bloom several weeks earlier than by planting directly in the border. They require a deep, rich and rather moist soil, and the sunniest position available.

CHOICE ROSES.

The Rose is everybody's favorite, and many, no doubt, would prefer a bed of Roses to anything else. There is no reason why they should not have one. Small plants, which are better for the purpose than large ones, can be bought almost as cheap as some of the ordinary bedding plants; and when it is remembered that a bed of Roses will last many years, it may justly be concluded that it is one of the most economical that can be made. The soil, however, should be made very rich with old manure, and, if convenient, a liberal sprinkling of bone dust. A top-dressing of the same material should be repeated every year. Rich soil makes rich Roses.

It must be remarked that all Roses are not hardy, and all are not equally well adapted for bedding. Two classes of Roses may be used, the Hybrid Rémontant and the Tea. The latter, however, are not hardy far North,

unless. From this list a good selection can be made. Get all the plants on their own roots, and not budded.

The following Tea Roses are among the hardiest and best for bedding, bearing mostly full flowers of delicious fragrance. A loose, open Tea Rose, however beautiful in the bud, yields but little satisfaction in the open air. The list is as follows: Bougère, Madame Lambert, Rubens, Sombreuil, Angèle Jacquier, Catherine Mernet, Coquette de Lyon, Monsieur Furtado, Pauline Labonté, Marie Ducher, Madame Bravy, Comtesse de Nadailiac, Marie Van Houthe, Caroline Kuster, Homer.

Both of these lists might be greatly extended, but hardly improved for the purpose in view. I will add, however, a few other excellent Roses from other classes, good enough for the choicest collection, and all constant bloomers, though all are not fragrant. Magna Charta, a Hybrid China.

LIKES AND DISLIKES OF THE CHRYSANTHEMUM.

What Chrysanthemums *do* like, says John Thorpe, President of the Society of American Florists, is:

To be planted firmly, in rich soil; plenty to eat and drink; to have at least four or five hours' sunshine a day; to be mulched after July 1st with grass or manure; to be well and often soaked with water or weak manure-water from August to October; to be divided every year; to be tied up so as not to be broken by the wind; to be protected from severe frosts when in flower.

What Chrysanthemums *don't* like, says the same unexcelled authority, is:

To be planted loosely, in poor soil; to be planted beneath the shade of trees, where there is no nourishment; to be starved: to be dry; to be smothered all summer by vines or other plants; to be left for years without dividing; to be placed where the

A ROSE HEDGE.

and even in the latitude of New York need some winter protection. I prefer the Tea Rose for bedding. Both classes are commonly called perpetual bloomers. The Teas really are such; the Hybrid Rémontants are not, though many of them often bloom a second time in the autumn. The true character of a Rose is not fully developed till the plant becomes well established in the ground.

The following Hybrid Rémontants are hardy, strong growers, free bloomers, fragrant, and good plants for a bed: Paul Neyron, Marie Baumann, Baronne Prevost, Alfred Colombe, Annie Wood, Rev. J. B. M. Cann, John Hopper, La Reine, Mabel Morrison, Anne de Diesbach, Caroline de Sausal, Pierre Notting, Charles Margottin, Marguerite de St. Amande, Hippolyte Jannain, François Michelin, Comtesse Cecile de Chabrigant, Madame Victor Verdier, Abel Grand, Gaston Leveque, Harrison Weir, Jean Liabaud, Madame Gabriel Luizet, Prince de Portia, Queen of Waltham, General Jaquette,

Agrippina, a Bengal. Hermosa, Malmaison, Bourbon Queen, Geo. Peabody, and Queen of Beddons, all Bourbons. La France, a Hybrid Tea. Mignonette, Paquerette, and Cecile Brunner are the new Polyantha Roses. They are very dwarf, bear tiny little double flowers in large clusters, are very constant bloomers, and will be very popular when better known. Their dwarf habit makes them very useful for an edging or outside row. Hybrid Rémontant Roses should be planted not less than three feet apart, and Teas not less than two.

Tea Roses are not thoroughly hardy at the North, and they should therefore have some kind of winter protection, which should not be put on, however, till the ground begins to freeze. I have found nothing better than a covering of straw, leaves, or coarse litter from the stable, with a few evergreen branches or something of that kind to keep the covering from blowing off.

P. B. MEAD.

sun never shines on them; to be blown over by the wind; to be severely frozen when coming in flower; to be in hot, dry and gassy rooms.

OUR FLOWER BASKET.

Tigridias should not be planted before all danger from frost is past. There are now red, yellow, and white varieties.

The most favorable time for planting and dividing herbaceous plants is spring. We would rather plant even late in spring than in autumn.

A fine hed could be made, says James Viek, with a Cactus or Yucca for the center, surrounded by Echeveria, raised a little, then Alternanthera, first a dark variety, followed by a light shade, surrounded by Echeveria. Perhaps the Echeveria running through the Alternanthera, forming some garland or ribbon-like design.

The Window Garden AND GREENHOUSE.

THE WINDOW GARDEN FOR MAY.

If not already done, sow Chinese Primroses and grow them in a cool, airy, faintly-shaded place on the piazza, or in a window frame.

Keep growing the young Cyclamens of this year's sowing, but the plants that have bloomed may be allowed to go to rest now. Don't frizzle them in summer, but lay them aside in a cool, shady place or plunge them out of doors an inch or more under ground.

Calceolarias or Cinerarias should not be sown for a month or two yet. Pot the remainder of your Gloxinias and grow to bloom in a warm but shaded place; there is no place so good for Gloxinias in summer as a shaded cold frame.

Show Pelargoniums or Lady Washington Geraniums, as they are commonly called, will now be in perfection. When they have done blooming don't dry them off very much; I would advise you, rather to plant them out in a slightly shaded spot, use their young wood as cuttings, and having secured what you want of young plants, throw away the old ones. My best blooming plants are only six months old from the cutting. Fuchsias should be at their best condition during May.

OLD BULBS.

Don't throw away the bulbs of Hyacinths, Tulips, Narcissus, and the like that you have grown in pots or boxes for winter flowers, but instead put them aside in some out-of-the-way place, and after the leaves die down then stop watering. Next fall plant out these bulbs in a cold frame or in some suitable place in the garden and let them stay there. The Hyacinths will produce a few weak but acceptable flowers about Easter; after a year or two the Tulips and Narcissus will become strong again.

CACTUSES.

After hardening them off well, put every kind of Cactus out of doors. If you take them from a shady place and set them out at once in a sunny position they will probably, after a little while, look very sick, blister, blotch and peel. Vigorous kinds like *Cereus* and *Opuntias*, if planted out, are apt to grow beyond bounds; better plunge them. But all Cactuses that have poor roots or are in bad health, should have the old soil shaken from their roots, and then be planted out in a warm, dry, sunny place.

Phyllocactuses set in shady places in summer may produce plump, green growths, but if you want flowers next spring better far have the shorter, redder growths made in the sunshine.

Epiphyllums, however, prefer a little shade in summer. Wet is very injurious to Cactuses in summer, therefore see to it that they are not under the drip of trees, that water cannot lodge about them, and in the case of the choicer *Mammillarias* be prepared to protect them overhead against protracted wet or misty weather.

When Cactuses are growing they like rich, porous soil, and I have found that they especially enjoy gritty, enriched earth. But the necessity of fine rubbish and pounded

brick-bats in the soil, as so often recommended in old books, is simply nonsense.

GERANIUMS FOR WINTER BLOOMING.

Don't plant out these in beds you wish to retain intact all summer, but instead, in some open, sunny place by themselves, as you should lift and again pot them about the end of July. If you get stout, stocky plants well rooted and established in their pots before cold weather comes, then you may reasonably expect an increasing supply of flowers from October till May, but if you depend on the Geraniums you lift and pot in September or October, you need not expect them to come into good bloom again before next February. The single-flowered varieties are free-bloomers, but if you want the blossoms for cut flowers the double varieties are better than the single ones.

Heliotropes should be treated in the same manner as Geraniums.

YOUNG PLANTS FOR WINTER FLOWERS.

Of a good many plants, young stock is better than old for winter use. Prepare a piece of ground where you can keep all the kinds together; in this way it is easier to attend to watering, mulching, pinching, staking and tying them, than it would be were they scattered about through the garden. Prominent among these are Carnations, Bouvardias, Libonias, Stevias, Sericographis, Justicias, Paris Daisies, Poinsettias and *Browallia Jamesoni*.

PLANTS THAT PREFER A LITTLE SHADE.

A shady place, as on the north or east side of a building, hedge or fence, but not under the drip of trees, will suit the following: Fuchsias, Begonias, Camellias, Azaleas, Myrtles, Crotons, *Dracaenas* and Palms. A southwest exposure especially should be avoided. Some of these plants will thrive in the sunshine but they will do better in the shade.

PLANTS THAT LIKE A SUNNY EXPOSURE.

Ibiseases, Abutilons, Cape Plumbago, Poinsettias, Ficuses (Rubber-plants) of sorts, Century Plants, Oleanders, and vines as *Passion-flower*, *Thunbergias*, *Clerodendrons*, *Cobaeas*, and *Iponomeas*. If not properly hardened off before being planted or plunged out of doors, these plants are apt to be scalded, and some of them, perhaps, completely defoliated; but if well inured to the weather before being set out, planted in rich ground and kept well watered, they do love the sunshine.

WM. FALCONER.

THE MONTHLY PELARGONIUMS.

When I read about the new monthly Pelargoniums in some of last spring's catalogues, I wondered whether it was worth while to try them or not. I have been so "taken in," many times, by novelties and "desirable new plants" that I was rather skeptical in this instance. But the idea of a Pelargonium flowering the year round was so attractive that I sent for four plants, two Fred Hehl, and two Robert Hehl.

They were small affairs when they came, but they began to grow at once, and by the end of summer were fine, bushy plants. In foliage and general habit of growth they are very much like other Pelargoniums, and as they showed no inclination to bloom for some months after I procured them, I began to think the "monthly" part a clever dodge

on the part of the florists to sell the ordinary varieties of the Pelargonium.

But along in September, when none of the Pelargoniums would think of flowering, I noticed a cluster of buds on one plant, and was glad to know that the "greatest acquisition to the window-garden for the last ten years," as one catalogue modestly put it, was not going to disappoint me by refusing to blossom, as I had feared, out of the usual season of Pelargonium flowering. There were fine, large buds in the cluster and many more small ones, and I saw another cluster coming as the first developed, and I began to think that perhaps I might have a succession of bloom from these new plants. I watched the development of the flowers as anxiously as flower-lovers watch the blooming of the Night-Blooming Cereus.

The first flower was as large as the average Pelargonium. It was white with a rosy blotch on each petal, that on the two upper ones being rather larger and darker than those on the other three. These petals are not like those of the Pelargonium, which differ somewhat in size and shape, but were all about alike, thus giving a round flower. It fully answered my expectations. I had not expected a flower as brilliant or showy as our Butterfly Pelargoniums. To look for such flowers, monthly, was to ask too much. When the fine, large buds had opened the effect was quite like a cluster of some of the small white and pink Azaleas. The flowers are durable, and by the time the first cluster had faded, the second one was ready to take its place. Buds appeared on the other branches, and soon the plant was covered with flowers. A small specimen had nine clusters on it, at one time. From that one may see what the possibilities are, with this new plant. And my plants have kept on flowering steadily. New branches have kept pushing out, until each plant is well covered with growing and blooming points. They are vigorous growers, more bushy and compact than the old varieties of Pelargonium, and more tractable, I think.

Robert Hehl has larger blotches of color than Fred Hehl, and the petals are sometimes suffused with pink. The effect of the flowers is very pleasing. They have a modest appearance, and yet are quite showy. I am confident that in them we have forerunners of a new class from which we may expect great things by and by. That they are free-flowering I know from my experience with them. If we can only get varieties with the gorgeous colors of the old Pelargonium, what a blaze of beauty we can have in our windows!

ELEN E. REXFORD.

THE CAMELLIA.

Fashion, which for some years past had refused to recognize this queenly flower in general society, is now taking the strange freak of reinstating it to its former glory. Already choice displays are seen at our exhibitions and in florists' windows; and several inquiries about their culture clearly indicate the revival of the Camellia; the following directions given by E. S. Rand, Jr., will therefore, no doubt, be of interest to many of our readers.

The Camellia should be grown in light loam, or sandy peat mud loam, say three parts loam, two parts leaf mould, one

part sandy pent. Fill the pots one-third full of potsherds, to secure drainage, which is indispensable. If the roots of the plant become sodden, particularly during the season of rest, the health of the plant is gone, and years of care may fail to restore its beauty, or remedy the evil caused by a little carelessness in watering. When in a growing state, you can hardly give too much water, and much good may be derived from frequent sprinklings and syringings; this operation, however, must never be performed in sunny weather.

One chief care in the culture of Camellias is to keep them perfectly clean; dust upon the foliage not only injures the beauty of the plant, but affects its health. The plants are injured by too much heat. Some hold that no artificial heat should be afforded unless necessary to keep off the frost, but as we wish our Camellias to bloom at a season when there is but little else to ornament the greenhouse, it is advisable to force them moderately.

A safe rule is never to allow the temperature to fall below 40° at night, or rise above 65° or 70° during the day. The plant will thus expand the flowers more slowly and naturally, and there will be no complaint of dropping buds, imperfect flowers, and yellow, sickly foliage. One prime mistake in floriculture is the little attention paid to uniformity of temperature. A plant can no more preserve a healthy state when exposed to an atmosphere varying from 30° to 100° in a few hours, now dry and now recharged with moisture, than can an animal. The progress of disease may be more gradual but it is sure to show itself, and, sooner or later, the death of the plant is the result.

The plants, when in bloom, should be shaded, as thus the flowers remain in perfection much longer. Give the plants plenty of air at all times, but during the season of growth protect them from chilling draughts, which would cause the young leaves to curl and stunt the plant. During summer the plants should be placed in a shady, airy situation, out of doors; allow room enough between the plants for free circulation of air. The practice of setting the plants in a mass, under trees, is most objectionable; in the first place the drip from the branches over head is injurious; and again, the pots become filled with earthworms, which are often difficult to dislodge from their quarters.

Another mistake in the culture of Camellias is too frequent re-potting. While the plant should not be allowed to become pot-bound, too much room should not be afforded. A vigorous plant will not require re-potting oftener than every three years; but on this point there is a difference of opinion.

It is a popular error that the wood of a Camellia should not be cut, while, on the contrary, there is scarcely a hard-wooded plant that bears the knife better. The plant is by nature symmetrical in growth, and, by judicious pruning, perfect specimens may easily be obtained. Pruning should be done after blooming, just as growth begins.

CHINESE PRIMROSES.

A more satisfactory flower for window as well as greenhouse culture does not exist. It is easily grown and almost always in bloom, the blooming season being most abundant during winter, when it is difficult to get large quantities of flowers on window plants, but in sunshine or shade the

SINGLE PRIMULA SINENSIS.

flowers of this plant are produced, and that during the most dismal part of the year.

The great improvement of late made in Primroses, gives us flowers of large size, some fringed, some plain, some double like a Rose, some only semi-double, but all beautiful, and varying in colors from the purest

DOUBLE PRIMULA SINENSIS.

white to the brightest scarlet. In addition to this the diversity and beauty of its foliage makes the plant attractive even when out of bloom. We have four-leaved varieties with leaves deeply and gracefully serrated, giving them a feathery and pleasing appearance; others have the foliage beautifully colored on the reverse side, producing a

pleasant contrast with the lively green of the surface.

Single Primroses are generally raised every year from seed, still they can be preserved in good condition for years, blooming more or less all the time. Young plants, however, give the most satisfactory results, and if raised during May or June, will commence flowering early in the fall and continue during the winter and spring months.

Seeds should be sown in shallow boxes, in soil composed of leaf mould and loam in equal parts, with a good mixture of sand to insure free passage of the water. Cover the seeds but lightly; place a pane of glass or paper over the box to maintain a steady moisture. As soon as the seeds germinate and begin to grow, gradually raise the glass to harden the seedlings to the light. When the plants show their first characteristic leaves, either pot singly into thumb pots or, what is better, prick them in around the edge of four or five inch pots, in which they grow more rapidly. The reason for this is obvious. The plants have the benefit of a more uniform degree of moisture than when in small pots which dry out quickly. When they have formed strong, bushy plants around the pots, shift singly into two-and-a-half inch pots, and keep shaded until they start to grow. Always place the plants deep enough in the soil to cover any bare stems which are apt to form, when grown in a high temperature, and far from the glass. As the plants grow, shift regularly until a size of six or seven inch pots is attained, in which they are to remain while in bloom. Place good drainage in all pots of six inches and over.

The most suitable soil for Primroses is a compost of well-rotted leaf mould, thoroughly decomposed manure, run through a quarter-inch sieve, so as to remove all small pieces of wood and reduce it to proper fineness.

Use equal parts of the leaf mould, manure and friable loam, mix thoroughly and add sufficient sand to insure porosity.

Considering the large demand for Primula seed throughout the United States and Canada, I have often wondered that some of our enterprising florists have not made a specialty of raising seeds and still more improving the already beautiful strains. As it is, we have to send to Europe for our Primula seed, when it may be just as easily grown at home. So many seeds that formerly had to be imported are now raised here that it is to be hoped the day will not be far distant when we shall raise our own Primula seed.

MANSFIELD MILTON.

OUR WINDOW BOX.

Healthy, vigorous growing plants can hardly be watered too much at this season, provided the pots are well drained. Such plants take up and evaporate water with great rapidity.

When planting pot-plants in the open ground and the ball of earth is matted with roots, the ball should always be broken by slightly bruising it between the hands before placing it in the ground, to lessen the resistance.

Lawn and Landscape.

THE VIEW OUTWARD.

Lawns are laid out and trees planted with the idea of making the grounds as beautiful and attractive as possible to the passer-by. This is so invariably the custom that I will let the few exceptional cases speak for themselves. The old adage of "Home first, and the world afterwards," is quite reversed in this prevailing custom. Perhaps it is natural for us to do this, just as it is to put on our best behavior and our best clothes for the critical eyes of the public; but to truly refined and thinking people there is something distasteful in this practice of sacrificing the beauty and pleasurable of the home, for the sake of furnishing a pleasing prospect for the outside world.

How many beautiful bits of scenery are shut out from the view of the inmates of homes, by attempting to surround the houses with imposing arrays of trees and shrubs, for the public to admire!

"What an easy, retired place, all shut away from the outside world;" says an enthusiastic, but unthinking person when going by such a place. Seclusion and shade may be desirable at times but too much of either is bad for the human family. Neither mind nor body can long flourish with such surroundings. It rests and refreshes the mind to let the eye reach out over miles of varied landscape, and view it in sunshine and shadow, as well as through the varying aspects of the seasons.

I doubt that I could find it in my heart to cut down noble old trees that had withstood the blasts of generations; but I am quite positive that I could easily bring myself to trim them out, and let in the sunlight and a view of the outer world.

There is some excuse for allowing thrifty trees of a natural growth to remain, even in inconvenient and undesirable places; but the designer and maker of a lawn may easily avoid these objectionable features, in planning his improvements. In planting his trees and shrubs he should carefully consider the size of their ultimate growth as well as their location. If there be an unsightly prospect in any direction it should be shut out of the range of vision, so far as practicable, by a growth of trees and shrubs. And the pleasing bits of landscape should be as scrupulously preserved; for no work of art can replace them with satisfactory equivalents. Men will pay hundreds and thousands of dollars for a, perhaps, faulty painting, while they ruthlessly sacrifice the invaluable original.

Yes, we must learn to arrange our lawns and grounds for our own satisfaction, and not altogether to please the public. In doing so we shall lead the public taste into more commonsense channels, perhaps. We must teach people to look at these things from our standpoint, instead of going over to theirs, as did the gentleman whose grounds I visited last summer. "Just come down this way," said he enthusiastically; "this is the finest view, and the point that I studied the effect from." It is needless to say that he led the way out into the street. The custom of the times makes these

things so common that we seldom remark upon them; yet I, for one, think it time to enter a protest against the cringing, catering spirit manifested by men who are generally cultured and intelligent. Such a spirit causes men to be inconsiderate of the home rights of their own families. In the arrangement of the home and its surroundings, let it indeed be, "Home first, and the world afterwards."

W. D. BOYNTON.

NATIVE FLOWERING SHRUBS.

Comparatively few persons are aware of the beauty of some of our native shrubs, which if they were met with in well kept lawns and shrubberies could not fail to be admired. The following is but a partial list of those that do well under cultivation.

Cercis Canadensis, Red-Bud, Judas Tree. For very early flowering, this shrub excels all our natives. The flowers are violet-purple and borne in great abundance before the leaves start. The effect is striking. The round leaves are odd and attractive. It is hardy at Boston.

Clethra alnifolia, White Alder, deserves a place in every garden on account of its delicious fragrance.

Kalmia latifolia, Mountain Laurel. An evergreen shrub which is very showy with rose-colored flowers in spring. For winter grouping this plant is always desirable.

Leiophyllum buxifolium, Sand Myrtle. Does well in the open sun on dry ground and is very ornamental.

Hypericum prolificum, Shrubby St. John's Wort. This is one of the very best of hardy undershrubs, and it is very easy of cultivation. It is a profuse bloomer.

Dirca palustris, Leatherwood. The neat and clean habits of this bush recommend it rather than the flowers. It thrives well in an ordinary dry soil.

Amorpha fruticosa, False Indigo Plant. A very attractive shrub, bearing its purple flowers much after the manner of some of the garden Spiraeas.

Andromeda floribunda gives a great profusion of pretty, heath-like flowers in early spring. When given shade the plant does well in an ordinary soil.

Euonymus atropurpureus, Burning-Bush. I have seen this in cultivation once or twice and it appeared to possess all the good qualities of the common European species.

Staphylea trifolia, Bladder-nut. This bush does well on ordinary dry ground. Its drooping clusters of bell-shaped flowers in early spring and the odd, inflated fruit in autumn entitle it to a place in the shrubbery.

Ilex copallina and *I. glabra*, Sumachs, give deep red foliage in autumn.

Hamamelis Virginica, Witch Hazel. I know of no native plant which blossoms at such an untimely season as this. After the leaves have all fallen in the autumn the curious yellow flowers make a display.

Ilex verticillata, Wintercherry. The best of our shrubs for ornamental winter fruit. It does well on ordinary dry soils.

Cornus, Dogwood. Most of the species of *Cornus* are very desirable shrubs, especially *C. florida* on account of its great showy involucres, and *C. stolotifera* on account of its red stems and abundant flowers. This latter species, although growing naturally in swamps, thrives well in dry grounds. I

think it is as good as the much praised European species *C. sanguinea*.

Symphoricarpos racemosus, Snowberry, is known and appreciated by all.

Of the *Loniceras* or Honeysuckles, *L. Sultivanti* (*L. flava*) is the best I have seen in cultivation, except, of course, the old favorite Trumpet Honeysuckle, *L. sempervirens*.

Sambucus Canadensis, or rather *S. racemosus*, Common Elder, is deserving of a place in any grounds. When properly trained it is certainly a very beautiful shrub. It seems a pity that this shrub is naturally so common and hence little prized.

Salix, Willows, are often highly ornamental, especially the staminate plants which give golden yellow "pussies" in advance of the leaves. *S. discolor* is the most desirable. *S. lucida* is to be recommended for its very bright foliage. J. H. BAILEY, JR.

PLANTING ORNAMENTAL TREES.

The Western N. Y. Horticultural Society's committee on ornamental trees and shrubs makes these excellent recommendations:

In planting out trees and shrubs it is desirable to give each specimen abundant room so the sunlight can reach the entire plant or tree. Do not plant beautiful shrubs in the shade of large trees, not wholly because the roots of the larger will exhaust the smaller, but because the effect of the larger over the smaller is to destroy the foliage, which is followed by the sloughing off of branches, very often destroying one side of the plant, or better still, killing it outright.

To grow perfect specimens should be the aim of every planter, and to accomplish this it is essential to give plenty of room to each specimen. Do not plant too closely, would be the caution we recommend. Too close planting is the cause of so many poorly furnished trees and shrubs. Wherever you find a beautiful, symmetrical, fully foliated tree or plant you will notice it is an isolated specimen situated where it has room naturally to develop itself with entire freedom. If you can have but one good perfect specimen, do not crowd two or more into the space.

TAKING UP FOREST TREES.

To take up a young forest tree, says a correspondent of the N. Y. Tribune, first wind a wet sack around the stem, close to the ground, so tightly that it cannot slip; then take a timber-hitch with a small cable-chain, cut off a few roots on the side opposite the steady lean, and you will get nearly every root whole, and plenty of soil. I took up 100 Rock Maples in this way last spring, after I had learned to wind the sack properly, without damage to the trees. In this way two men with a team will take up more trees in an hour than they could without a team in half a day.

BEST EVERGREENS FOR THE LAWN.

Mr. E. S. Carman, editor of the Rural New Yorker, whose collections of ornamental trees are very large and choice, says that if he were asked what three evergreens he would recommend above all others for the lawn, he would name first, The Blue Spruce, *Abies*, or, according to the new nomenclature, *Picea pungens*; second, the Oriental Spruce, *Abies orientalis*, and, third, Alecock's Spruce, *Abies Alecockiana*. These are extremely hardy, and very distinct and desirable in every way.

Foreign Gardening.

PALMS AT HOME. THE ASSAI PALM.

Euterpe edulis. This excels all other Amazonian Palms in graceful beauty. It is found plentifully around Para, Brazil, and is probably the Palm which first attracts the attention of the newly arrived traveller. The trunk of the largest seldom exceeds a few inches in diameter, but it waves its crown of light-green drooping fronds fifty feet in the air.

This Palm usually grows in groups of three to five, the trunks springing from the same root. It is a beautiful sight to see these trees when struck by a strong wind. They will bow almost to the ground, but they never break and are very seldom uprooted. They are generally found in the gardens of the city, and grow in untold numbers upon the islands of the coast, becoming less numerous as one ascends the river.

The flowers are in feathery spikes which spring from the trunk a little below the crown of leaves; they are succeeded by the fruit, which when ripe is black with a glaucous bloom and about the size of a Concord Grape. It consists of a hard seed enveloped in a very thin pulp covered by a thin, hard shell. In the delta of the Amazon this fruit ripens all the year round, but upon the river it is only in season for a few months in the spring. One can imagine in what abundance this Palm grows when he knows that the chief food of the lower classes in Para is the drink made from the fruit, which is eaten with farinha made from the *Mandioca* root.

This drink is prepared from the ripe fruit by slightly changing it to crack the shell, and then washing off in water, one thin pulp surrounding the seed. This pulp is not much thicker than a sheet of paper. The liquid is then passed through a fine Palm sieve, cold water is added to bring it to a proper consistency, and it is ready for use. In color and taste it much resembles stewed Blackberries; it is called wine of Assai, for in Brazil any infusion of fruit in water is called wine, the word not necessarily implying a fermented liquor. This drink is very nourishing and very palatable if a little sugar is added; it is also very healthful.

One walking in the streets of Para in the lower quarters, sees this drink in preparation at times in almost every house. It is sold at the street-corners, and is carried round by negroes who bear on their heads huge earthen bowls full, or broad, flat trays covered with cups or bowls of assai, while the air rings with the shrill cry, "Assai, Assai." The native buys and drinks it with relish, but the foreigner, if he has witnessed the preparation of the drink in the dirty sheds and hovels of the city with all the filthy surroundings, prefers not to taste "assai" unless he knows the woman by whom it was compounded.

The fruit of this Palm germinates readily; indeed, outside of the houses where the drink is prepared it is no uncommon sight to see the young plants coming up as thick as Oats, and at present writing, in our own back-yard, where the seed has been thrown, we could fill an order of many thousand

plants. The tree is of rapid growth, fruiting in five years from seed. In the greenhouse it is very ornamental, and young plants make an attractive centre ornament for the dinner-table.

THE "BACABA" PALM.

Oenocarpus Bacaba. Quite different in character is the *Bacaba*, which is also common around Para. The tree is about forty feet in height, with thick, straight trunk, which is crowned by semi-drooping long dark-green fronds arranged opposite, which give the tree a rather stiff appearance. It is, however, a stately tree, and when full of the long, drooping spikes of fruit which hang from among the lower leaves is very ornamental. The fruit is about the size of that of the Assai but is of a rusty-brown color.

A drink is prepared from it in a similar manner, which in color resembles rich chocolate and cream, and which in taste reminds one of stewed Gooseberries. To our taste it is far better than the assai, but it is said not to be as wholesome and that a frequent indulgence renders one liable to chills and fever. We have, however, drunk it more freely than the assai without any ill effects.

The young plants of the *Bacaba* are very beautiful, the fronds very richly colored, varying from deep-maroon to purplish-green. This Palm is seldom found in catalogues but would well repay cultivation, which is very easy, as the seed is readily procured and germinates without difficulty.

E. S. RAND.

VEGETABLE CULTURE IN BERMUDA.

Consul Allen says that Onions, Potatoes, and Tomatoes comprise almost the entire production of Bermuda, and give employment to the greater portion of the inhabitants, and the prosperity of the colony depends largely upon the success of the crop and the demands of the markets.

ONIONS.

In Onion-growing the seed used is grown in the Canary Islands, and is imported in the months of August and September; it is sown in the months of September, October, and November, thickly in beds, the ground having been heavily manured with stable manure two or three months before sowing. The white seed is sown first, and produces the earliest crop, the shipment of which commences in March. When the plants are sufficiently large—about six to eight inches high—they are transplanted into beds about four feet wide, the plants being set about seven inches apart each way. The plants from the white seed are transplanted as soon as they are large enough, but those from the red seed are not usually transplanted until the beginning of January, and the ground requires to be only moderately manured. If transplanted too early, and the soil is too rich, the bulb is likely to split in soil to several pieces, and is worthless. After transplanting, the soil requires to be lightened once or twice, and the weeds removed before they mature. As soon as the top begins to fall, the Onions are pulled and allowed to lie on the ground for two or three days, when they are cut and packed in boxes of fifty pounds each and sent to market.

All the Onions are delivered at the port of shipment in boxes, ready for the market, and for the past two years the producer has been compelled by law to place his name or

initials conspicuously on each package. It is estimated that a large profit on the outlay is realized, when the crop is large and the market good, an acre of ground sometimes returning as much as £120 to £170.

POTATOES.

For the cultivation of Potatoes the seed was formerly nearly all imported from the United States, but of late years has come largely from New Brunswick, Nova Scotia, and Prince Edward's Island. The ground for Potatoes is usually plowed or broken up with the spade and raked, the seed cut into pieces with one or two eyes, and planted by forcing into the ground with the fingers to the depth of about four inches, in rows about twenty inches apart, and about eight inches in the rows. From six to eight barrels of seed are used to the acre. When the plants are a little above the ground, the soil is lightened between the rows with a fork, and when about six inches high the earth from between the rows is hoed round the plants, only one hoeing being required.

TOMATOES.

For growing Tomatoes the seed is imported every year, and is sown about October, and transplanted in December, into rows about six feet apart, and the plants are put about four feet apart in the rows. As soon as transplanted, the ground round the plants is covered thickly with brush,—chiefly the wild Sage which grows over the hills,—not only to protect from the wind, but to keep the fruit from the ground. The brush is usually raised once by running a stick under and lifting it enough to clear the soil of weeds, no other cultivation being required. Six or seven quarts of fruit from the hill is considered a fair crop. The fruit is rolled in paper, and packed in boxes containing about seven quarts each. The price of land in Bermuda varies from £30 to £40 an acre, and in some cases not more than one-eighth is susceptible of cultivation. It is estimated that there is an annual export of 350,000 boxes of Onions, the box containing about fifty pounds, and of Potatoes, 45,000 barrels.—*Scientific American.*

DWARFING TREES.

The Gartnerora gives the following interesting account of the method by which the Chinese produce miniature trees, and which could easily be tried without trouble or expense: The pulp of an Orange is removed by an aperture the size of a half dollar, and filled with Coconut fibre, tow, and powdered charcoal. In the center is placed a seed of the tree it is wished to grow. The Orange is placed in a glass or other vessel, and the compost kept moist. The seedling germinates, the stem protrudes through the hole in the Orange, the roots penetrate the rind. The roots as soon as they reach this stage are cut off close to the rind, and this is continued for two or three years. The tree ceases to grow, and assumes the aspect of an old tree. The roots equally cease to grow, and the rind of the Orange is painted and varnished.

The Japanese have a way of dwarfing and growing forest trees in comparatively very small pots. Visitors at the centennial exhibition in Philadelphia will recollect the odd-looking specimens brought from Japan, which were said to be over a hundred years old.

Exhibitions & Societies.

NEW YORK HORTICULTURAL SOCIETY.

The superb display of Orchids at the Spring Exhibition of this society, held March 3d, showed plainly in what high favor these now so fashionable flowers are held. Never in the history of the society were such quantities and such perfect specimens of Orchids shown.

The lavish display of Orchids by Thomas Emerson, gardener to Mr. Wm. B. Dismore, of Staatsburg-on-the-Hudson, formed the center of attraction. Of some kinds a dozen or two blooming spikes were shown in one huge bunch, and if one has the material to do it with, this is certainly the most effective way to exhibit flowers. Among the best in the collection were *Oncidium atatum*, *O. luridum*, *Calogyne cristata*, *Phajus Wallachii*, *Laelia anceps*, *Phalenopsis Schilleriana*, *P. Stuartiana*, *Dendrobium unabile*, *D. macrophyllum*, *D. nobile*, and *Odontoglossum Rossii*.

Wm. H. Clements, gardener to Mrs. Chas. Morgan, who never shows anything inferior, excelled himself in the excellence and beauty of his Orchids, the most striking of which were *Succolabium giganteum*, *Cattleya Trianae*, *C. nobilior*, *Laelia harpophylla*, *L. flava*, *Phalenopsis amabilis*, *P. Schilleriana*, *P. leucorhoda*, *Sophronites grandiflora*, *Odontoglossum Jenningsii*, *O. Alexandrae*, *O. cirrhosum*, *O. Rossi majus*, *Calogyne cristata*, *Dendrobium glumaceum*, *Epidendrum Wallisii*, *Cyrtopodium Harrisianum*. Three or four other exhibits, the owners of which we could not ascertain, contained very fine specimens of these curious plants.

In addition to a magnificent display of the leading varieties of Roses were several of the newer kinds. The "Bennett" Rose improves considerably by nearer acquaintance; it is certainly a most beautiful Rose. "American Beauty," shown for the first time by Geo. Field & Bros., Washington, D. C., is a grand Rose of large size and exquisite fragrance. Reine Marie Henriette, a variety not frequently seen, is a charming Rose, cherry-red, large and very double.

Hallock & Thorpe made a grand exhibit of Hyacinths, Tulips, Crocus and other spring-flowering bulbs, also Carnations, Geraniums, etc.

Albert Benz showed his new Carnation, "Douglaston," in greater perfection even than at the last meeting, also his new Calendula, and remarkably beautiful Pansies, and Lilies of the Valley.

Siebrecht & Wadley exhibited a large collection of miscellaneous plants, especially notable among which were *Anthurium Scherzerianum*, *A. Farrisianum*, and *A. Andreanum*.

The new Carnation "Scarlet Gem," exhibited by Craig Bros., attracted much attention. It has a peculiar, very decided scarlet, and perfect shape.

Some 50 varieties of Camellias were shown, the first in many years. Cherarinas, Begonias, Violets, Azaleas, Abutilons, Amaryllis, Pansies and endless varieties of other plants added to the attractions of the exhibition, which was declared by many visitors and exhibitors to be the best one held by the society in many months.

APRIL MEETING.

Coming so shortly after Easter with its heavy drain on flowers of various kinds, the April Exhibition could hardly be expected to be as large as the previous one. Nevertheless three broad tables running through the entire length of the hall were densely covered with beautiful flowers and plants.

A magnificent specimen of *Clerodendron Balfourii* occupied the place of honor at the head of the center table. The plant was trained on a cylindrical wire frame about six feet high and three feet in diameter, and was completely covered with its charming white and scarlet flowers; exhibited by Martin Lipps, gardener to Mrs. C. Spofford.

A collection of Orchids which had arrived from England the same day attracted much attention. The specimens were in full bloom, and in much better condition than one should suppose it possible they could be after so long a sea voyage. It comprised *Odontoglossum gloriosum*, *O. Alexandrae*, *O. cirrhosum*, *O. Andersonianum*, *O. Rossi majus*, *O. Pescatorei*, *O. Sanderianum*, *Mastdevallia amabilis*, *M. Harryana*, *M. Shuttleworthi*, *Dendrobium nobile*, *Oncidium succolabium*.

The prize for the best new plant was awarded to Wm. Clement, gardener to Mrs. M. J. Morgan, for *Athurium Rothschildianum*. The Orchids from the same exhibitor formed, as usual, one of the principal attractions.

Of Roses the display was really superb. In a large bunch of Paul Neron, none of the flowers were less than five inches in diameter, and a bunch of Magna Charta contained even larger flowers.

Azaleas were shown in great numbers and made a gorgeous display.

R. B. Parsons exhibited a large collection of Camellias.

A collection of Cherarinas of rare excellence was shown by John Farrell, gardener to Wm. Barr.

Chas. Bird, Arlington, N. J., exhibited a bunch of Mignonette, the spikes of which were, we think, the largest we have seen.

The collection of cut flowers were unusually choice, especially the exhibit of Geo. Lucas, gardener to S. L. M. Barlow, containing many Orchids, Nymphaeas, etc.

In the miscellaneous department many well-grown and beautiful specimens were notable, Lilies, Hydrangeas, Ericas, Begonias, Ixias, Violets, Pansies, Carnations, Geraniums, Tulips, Hyacinths, etc.

Among the vegetables, an immense Cauliflower from Palatka, Florida, attracted most attention.

SOCIETY OF AMERICAN FLORISTS.

At a preliminary meeting held recently in Pittsburg, it was decided to hold the first general meeting of the society at Cincinnati next August. The programme contemplates an exhibition of plants, both old varieties and new, of cut flowers, of florists' supplies and heating apparatus, green-house structures and appliances, besides an exhibition of any and all inventions connected with the florists' trade.

Each day there will be three sessions, at which one or more original and practical papers will be read and discussed. The cooperation of the most prominent and skillful floriculturists of the country has already been promised, so that the success of the meeting as well as the society is fully assured.

AMERICAN INSTITUTE FARMERS' CLUB. FLOWER-BEDS FOR COUNTRY HOMES.

The following excellent paper was read at the second March meeting by Peter B. Mead, chairman of the committee on agriculture.

I have occasion to pass over a considerable extent of country in the course of a year, and am always surprised to see so little attempted in the way of ornamentation in the door-yards of farmers' homes. This is true, also, but in a less degree, of village homes. I could, indeed, name a number of villages which are noteworthy for the neatness and good taste to be seen in nearly all the door-yards on the principal streets; but where one such is to be seen there should be a hundred. Such villages are not very uncommon in New England, Pennsylvania, and parts of the West. They are usually regarded as evidences of thrift and success. While this, in many cases, is doubtless true, they are, to my mind, evidences of a good deal more; that some people, irrespective of wealth, have learned to know that "life is worth living."

It is a great pleasure to me to be able to say so much for many village homes. I wish I could truthfully say as much for our farmers' homes. While here and there, like oases in a desert, a pleasant green spot with a few flowers meets the eye, it forms the exception, and not the rule. Why is this so? I have tried to learn the cause, and found one of three reasons generally given by my farmer friends. One says, "Oh, I haven't got the time to bother with these things." Another says, "It costs too much. I'm too poor." Still another says, "Well, I don't know. Our folks don't seem to care much for them." On asking the wife, however, I almost always find that she cares a good deal for them, even in cases where the life of the wife is reduced to drudgery by the care of children and providing for many farm hands, without help in the kitchen.

Let us look at these reasons: There are few farmers who cannot occasionally spare half an hour for improving and ornamenting their door-yards, thus enhancing the value of their property, besides making home more attractive to all. This occasional half hour is all that is needed on the part of the man. The woman will do the rest.

Next, let us look at the cost. This is a great "bugbear" which can easily be put to flight. The bed once made in the manner and form presently to be explained, it can, if a man be so very poor, be filled with beautiful flowers at a cash outlay of 10 cents, and in some cases at half that sum.

Lastly, we have the poor man who tries to deceive himself with the excuse that "his folks don't seem to care much for flower-beds." This man, be it remembered, has a wife and children, and it is possible that he cares so little for them that he really does not know what they care for. He probably never asks. Go to this hard-worked and much-traded woman, and simply ask her how she would like to have a few flowers about the house. Instantly the hard and careworn look leaves her face, her eyes brighten, and for the moment she seems a transformed being. Whoever else may not care for the flower-beds, it is not the women or the children. How easy it seems for some men to forget that they ever had a mother.

Let us be thankful that there are not more of such thankless creatures.

In making beds you will need only about 20 feet of strong twine; a tape line or ten-foot pole, and three hard-wood stakes about 15 inches long, half an inch in diameter, and pointed at one end. A good substitute for the wooden stakes is half-inch wire pointed at one end, and which any blacksmith can furnish. One of these stakes is to be used as a scratching-pin, and the others for holding the string at the points of radius while the outline of the bed is being marked.

If the bed is to be made in the sod, the grass should first be cut short, in order that the mark of the scratching-pin may be plainly seen. The outline may be easily and neatly cut by any old table-knife ground to an edge. After the edge is cut, spread two or three inches of well-rotted manure over the bed, and dig it under. The soil should be made moderately rich and mellow to the depth of at least a foot. If the bed is to be made on the naked ground, first spread the manure and dig it under. Then put in the stakes, mark the outline, and lay the sod so that it laps over the mark about an inch, so that a clean edge may be cut. Beat the sod down firmly with the back of the spade, scratch the outline again, and cut the edge.

The middle of the bed should not be raised more than two or three inches above the edge or border. Nothing, to me, is more unsightly than a flower-bed raised a foot or more in the center. It is not only in bad taste, but it is bad for the plants. Rake the surface off clean and fine, and the bed is ready for planting. The size of the bed should be made to correspond with the size of the place, bearing in mind that a small or moderate-sized bed looks better than a very large one under all circumstances. In a country door-yard I would prefer two small beds to one large one. They can be made more effective, and afford an opportunity for a greater display of color.

Having made the bed, the question naturally arises, What shall we put in it? Keeping in view the object with which I set out, I will name only such plants as can be easily obtained and easily grown. I will first give a list of what are called "bedding plants," which the villager and the farmer can buy cheaper than he can raise. Among the best of these for our present purpose are the Scarlet Pelargonium or Geranium, *Coleus Verschaffeltii*, Petunia, Achyranthes, Salvia, Ageratum, Verbena, Fuchsia, and Cannas, the last with a groundwork of Sweet Alyssum, Mignonette, and *Lobelia erinus*. There are others, but these are good and easy to grow. They may be set from 10 to 15 inches apart, except the Fuchsias and Cannas, which should be at least two feet. These plants will cost from \$1.50 to \$2.50 a dozen, and late in the season somewhat less.

I have said that a bed could be filled with beautiful flowers, at a cash outlay not to exceed 10 cents. It so happens that the list of annuals presents us with some of the most charming bedding plants we have, though they are seldom used for this purpose. I will name a list that flower freely, and that can be raised without the aid of a hot-bed. The seeds of all of them can be bought for five or ten cents a packet, and a packet will furnish plants enough for a large

bed. I have used them all, and know just what they will do. You can buy them in mixed colors, or each color distinct. For the beginner I would name *Phlox Drummondii*, Petunia, Double Zinnia, Dwarf Nasturtium, *Convolvulus minor*, *Dianthus Chinensis*, Nemophila, Schizanthus, Eschscholtzia, Godetia, *Sabola splendens*, *Thunbergia alata*, and for a late bed, Portulaca. I could name others, but the list is long enough to select from. *Thunbergia alata* and its varieties are running or climbing plants, but they are beautiful bedding plants notwithstanding. When the runners reach the edge of the bed, you have only to turn them towards the middle to keep the bed in good form. *Dianthus Chinensis* is called biennial; but it flowers the first year, and a bed of it will last several years in good condition. It is a beautiful, free-blooming plant, and a great favorite among those who know it. *Heddeviigi* is one of its best forms. I may suggest that only one kind of plant should be put in the same bed; but the kinds of plants may be changed from year to year to suit one's taste.

The seeds should be sown early in some dry, sunny spot and transplanted when an inch or so high, selecting a cloudy day for the purpose, if possible. Otherwise, water the plants freely. Sow the seeds thinly in drills, and press the earth upon them. Cut the weeds down as soon as they are big enough to be seen, is a good rule for universal application. It is so easy to do it at this time, but so hard when they get to be large.

It is the duty, as it ought to be the pleasure, of every man who owns a home, not only to improve it, but to make it beautiful and attractive to his family, and especially to his children. Every child, at least, ought to feel that there is no place like home. Let the farmer remember how the wife toils day after day to help him make the farm pay, and what a tender, soothing, and sympathetic being she is in the sick-room, and then let him resolve that henceforth he will help her to make home both beautiful and happy. Let me hope that I have said something that will be helpful to him in carrying this resolution into effect, knowing, as I do, that he will find it a pleasure, and not a toil, to surround his home with these silent-speaking but eloquent children of Nature, whose sweet breath and beautiful array are a perpetual delight, not only to those at home, but to all who pass by on the way.

A GRAND STRAWBERRY EXHIBITION.

It is proposed to hold the coming June in New York a Strawberry Exhibition, under the auspices of the American Institute Farmers' Club. The rapid progress in Strawberry Culture, and the many new varieties introduced within the past few years, make such an exhibition especially desirable. It will continue two days, and during its progress meetings will be held for the discussion of the merits of the various varieties on exhibition, and on Strawberry culture in general. It is expected that all the extensive Strawberry growers within convenient reach of New York will exhibit, and cooperate in the undertaking, so as to make the exhibition as well as the meetings the largest and most interesting ever held in the city. It is yet too soon to decide upon the most

suitable date, but as soon as the arrangements have been completed, circulars and prize lists will be issued and mailed to anyone desirous to receive them who will address the secretary, D. R. Garden, American Institute, New York.

THE CHAUTAUQUA TOWN AND COUNTRY CLUB.

The grand success of the Chautauqua Literary and Scientific Circle with its 56,000 pupils, constituting the largest school in the world, has suggested the idea of organizing a branch society for agricultural and horticultural education. Modern educational systems, those of the Kindergartens, especially, are rapidly superseding the old routines. Colleges and high schools, excellent as many are in their special fields, are sadly inefficient in reaching and educating the hundreds of thousands who, while obliged to stay at home, long for knowledge and self-improvement. To all these this institution extends the hand of welcome, and is prepared to furnish all the educational facilities that circumstances permit, and that are best adapted to the ability, energy and diligence of each pupil. And all this without any expense whatever except the nominal membership due of 25 cents.

The main objects of the C. T. C. C. are: First, to help its members to learn something about the earth on which we live, its plants, flowers, and fruits, and to make the acquaintance of the plants and animals on the farm and in the house; secondly, to help its members to become trained, skillful, and accomplished; and, thirdly, to show them how to use their skill and knowledge in gaining health and happiness. Fourthly, to show its members how money is earned, to point out the way to many useful trades and arts, and to show them the value of good and honest work. Lastly, to show by the study of nature something of the Creator's wonderful ways in managing this beautiful world.

The home of the C. T. C. C., or headquarters for work and information concerning all matters, excepting the entrance of new members, will be at Houghton Farm, Mountainville, Orange Co., New York. Houghton Farm is a large, first-class farm, devoted to all kinds of farm crops and garden work. Everything is carried on at the farm that can be found on any farm in the Northern States, including cattle raising, horses, pigs and sheep, orchards, greenhouses, poultry yards, kennels, and dairy, and fruit, flower, and vegetable gardens. There is, besides all these branches, a first-rate meteorological and experimental station. Each department is carried on to obtain the very best results possible.

Nowhere else could such admirable facilities be found as are here placed at the disposal of the Club, by the liberality of Mr. Lawson Valentine, the proprietor of Houghton Farm.

Although the C. T. C. C. is as yet scarcely well organized, its success is already fully assured, and the amount of good it may produce is simply incalculable.

Circulars explaining fully the details of the course of studies and conditions of membership—and we advise every boy and girl reader of THE AMERICAN GARDEN to become a member—may be had by addressing C. T. C. C., Houghton Farm, Orange Co., N. Y.

Miscellaneous.

GARDEN PEAS AT HOUGHTON FARM. THE THREE YEARS' TRIAL.

Seasons:—1882; Fair but growing unfavorably dry towards maturity. 1883; exceptionally favorable. 1884; very favorable. The Telegraph has thus led for three years in number of peas per pod, size and weight of peas and pods; but in pods per plant it is third, and therefore its productiveness for a given length of row is inferior to the Champion and the Imperial. Although in number of peas to the pod the Blue Imper-

were counted as pods. In obtaining pods for weighing and counting contents, those were taken as if picking for table use; very imperfect pods being rejected. The figures therefore fairly represent the average facts. The season of 1884 was exceptionally favorable for Peas, and all varieties made a fine, healthy growth. All entered in the table had like exposure and treatment, and were grown on good garden soil. Seed was obtained from different localities and in some cases of different ages, to observe, in the same variety, the effect of these differences. The American Wonder, no matter where grown, was very true to type and even in yield; yet the Long Island seed gave best

fact that, in this instance, the older the seed the better the result. The 1881 seed produced more pods per plant, and more and heavier peas per pod than fresher seed, and the 1882 lot gave better results than the average of the two of 1883. The same holds true in the case of the "First of All," where the 1882 seed did much better than that a year younger. The oddity of this list is the last mentioned in the table: a Pea bought as a dwarf grew to six feet, was 88 days in maturing, and produced over 70 pods to the plant, in pairs, but the peas small and light.
HENRY E. ALVORD, *Manager.*

MAY FLORAL FASHIONS IN NEW YORK.

The demand for plants and cut flowers is unusually large this spring. Since the catalogues were issued by leading growers, there has been a constant stream of orders, and in new varieties of Roses, and plants destined to have a "run," the supply is not sufficient. The leading rage now is for blooming plants of a golden color. Acacias have never before been cultivated in such profusion, nor sold in such quantities. Everyone who has a greenhouse will have an Acacia, even if it is a small one. A certain plantsman has realized \$180 from sprays of *Acacia pubescens* cut from one plant. This is a shrub standing 13 feet high. *Streptosolen Jamesonii*, the old-fashioned *Browallia Jamesonii*, has been revived, and at once leaped into popularity on account of its golden-flame tints and its graceful habit. *Cytisus racemosus*, or more properly *Genista fragrans*, is the latest craze in yellow-flowered plants. It is a very graceful shrub with bright golden blossoms, and it is somewhat remarkable that it has been so long neglected. Among other plants which are bought up eagerly, are *Coronilla glauca*, *Mahernia odorata* and *Jasminum revolutum*. Leaving the yellow flowers, we must not overlook *Begonia metallica*, which is sought for its polish and wonderful bronzes; and Staghorn Ferns, which are so curious and ornamental that they are now the most fashionable pendants in greenhouses, and are grown with excellent success in the window. The species of Staghorn Ferns most in vogue are *Platycerium grande*, *P. Willinkii*, *P. biforme* and *P. Wallckii*.

PANSIES.

Pansies have never yet had such prominence as this spring; it is not remarkable, for they are so splendid, and florists are learning how to use this flower in plaques, panels, and corsage bunches, so that its elegance is entirely shown. The Pansy must be so placed that it will look at you, otherwise its contour, its velvet, and shadings are not disclosed.

The seedlings of the season have marvelous combinations of color—rich yellows, splashed with maroon; black velvet with an eye of gold; mazarine blue, with scratches of royal purple, and those plum-colored with gilt edges, and those smoke-tinted with lines of brown and gold marking the petals, and those salmon-colored, pale gray, and bronze, streaked with prismatic pencillings, are indeed "Pansies for thoughts."

WEDDING BELLS.

A new style of wedding bell is one of the fashionable novelties. It is made of white flowers, usually *Lilium candidum*, and at one side has a veil of Roses hung over it. From

NAMES OF THE VARIETIES TRIED THREE YEARS.	MATURITY			GROWTH.			RELATIVE PRODUCTIVENESS.												
	Planting to Picking.			Length of Haulm.			Pods to the Plant.			Gross weight of given number of Pods.			Weight of Edible Peas to given number of Pods.			Peas per Pod.			
	Days.	Inches.	Inches.	1882	1883	1884	1882	1883	1884	1882	1883	1884	1882	1883	1884	1882	1883	1884	
Dwarf Blue Imperial	59	69	70	36	37	37	1	1	1	1	3	3	3	3	3	3	4	4	4
McLean's Advancer	54	70	53	58	50½	21	2	4	4	3	4	4	4	3	3	1	1	1	1
Culverwell's Telegraph	68	67	69	55	61	60	3	3	3	1	1	1	1	1	1	1	1	1	1
Champion of England	68	69	66	67	65½	66	4	2	2	2	2	2	2	2	2	3	3	3	3

rial is least, it leads in number of pods to the plant, and for three years its average net product of edible peas to 10 feet in the row has been greater than the others; add the low growth of this variety and its very fine table quality, and it acquires a front rank in the list. The Blue Imperial is somewhat inclined to mildew, but seldom enough to hurt its fruit, while it withstands drouth better than almost any other variety. Planted at the same time, of the four varieties in this table, the Advancer is usually two weeks earlier in maturing than the others. The general average of the Champion is very high, and in quality it is equal to any.

THE TRIAL FOR 1884.

In the experiments last year, see below, for light of haulm, instead of taking any number of vines consecutively in a row, ten single plants were selected for measurement, of average size and vigor. The same method of selection was pursued in counting the number of pods per plant; well-set blossoms

results in both plantings. Comparison of the two plantings, shows this variety should be grown early. The Blue Peter was rather more productive than the Wonder.

Sibley's "First and Best," Henderson's "First of All" and Carter's "First Crop," are so similar in every respect, that they are not entitled to distinct names. They were all earlier than the dwarfs above mentioned and more productive. In earliness, productiveness and quality, the Dan'l O'Rourke maintains its good reputation. The four lots of seed of the Advancer are shown by the table to have proved remarkably even in growth and product. The merits of the Blue Imperial are named in connection with the first table; its habit of producing pods in pairs is alone enough to account for its great prolificacy. Culverwell's Telegraph and Carter's Telephone are almost identical in appearance and product. The Champion of England needs no word of commendation,—but attention is called to the curious

the top of the bell are two long cords made of Hyacinth flowerets string together, which are caught to one side of the room and held by a full tassel of Lily of the Valley sprays. White Forget-me-not is one of the dainty blossoms now in use; it is combined with Moss Rose buds effectively.

FLOWER-HOLDERS.

Blech-bark baskets, hand-painted, or decorated with lichens and fungi, are the newest flower-holders. They are in all colors, the ones that are light being filled with dark Roses, and vice versa. Each basket is trimmed with a sash of satin ribbon. An enterprising florist forced Snow Drops this season, which is the first time this has ever been done in this country: the little white-capped darlings created a furor, and although fragile, have proved charming in decorations when the bulbs have been plunged in *Lycopodium Krausianum aureum* and the Snow Drops have flecked the mossy golden carpet.

BRIDAL FLOWERS AND EASEL STANDS.

The bridal bunches for the weddings this month have all of them contained a spray of Orange flowers. A large hand bouquet made of Trailing Arbutus, with a cluster of Orange flowers at one side, was admirable. An easel stand was made of white blossoms, on which this bunch was placed near the bride during the wedding ceremony.

Pedestals around which growing vines are trained, being rooted in pans at the base, are extremely ornamental for the parlor. Ivies are the plants most used for the purpose.

A vine easel is a beautiful support for a picture, particularly the portrait of a dead friend, whose likeness it is pleasant to surround with fresh growing plants. Bamboo should be the wood of the easel, as it is hollow, and will hold tins, made especially to fit into apertures which should be cut at equal distances—say 18 inches apart. Fit the tins and fill with good soil. In these, plant free-growing vines. *Tradescantias* and *Lycopodium scandens* are the prettiest. Moss over the slits. When the vines are well grown, the bamboo will be entirely garlanded, and a most charming easel will be the result,—far handsomer than ebony or gilt. A portrait on it will be literally framed in vines.

FLORAL DESIGNS.

There are a few florists in the metropolis who seem to be able to weave flowers into any form or design. An entire tea-set was made for a kettle-drum lately. The tray was made of yellow Button Daisies; on it stood cups and saucers composed of purple Heliotrope. The tea-pot or "kettle" was made of Hinsdale Carnations, as was the milk picher and sugar bowl.

A coach three feet high was an artistic piece made of flowers for the center of the table when a dinner was given by the Jockey Club. It was so neatly made that every part of the running-gear was distinct. FLORA.

Throughout the Northern States there is generally more profit in late berries than in early ones.

The Kitchen window-garden is frequently the only place in the house where healthy plants are to be found, for the simple reason that it is the only one where exist the conditions favorable to their growth: Even temperature, proper ventilation, and moist atmosphere. The plants are at home there.

ANSWERS TO CORRESPONDENTS.

Marshal Niel Rose. Mrs. P. C. P., *Laprairie, Cal.*—This is one of the most beautiful as well as most delicate Roses in cultivation, which even in a special Rose-house requires skilled and careful treatment. It would be useless to attempt its culture in an ordinary room or window.

Bullmore Belle Rose. E. M. B., *Greenfield, Mass.*—This beautiful climbing Rose belongs to the class of Prairie Roses, and is therefore sometimes called simply: Prairie Rose. The Queen of the Prairie, and Gem of the Prairie are varieties of the same class. They are perfectly hardy in this latitude. See article on Roses, page 115 this number.

Grafting Lemon-Trees. A. G. K., *Racine, Wis.*—Lemon or any other trees will bear fruit without being grafted, but the seedlings will rarely produce as good fruit as their parents, if of choice kinds. The object of grafting is to insure the bearing of fruits of the same kind as that of the tree from which the graft is taken, and also to produce earlier fruitage.

Chinese Yams. J. W. R., *Shelbyville, Tenn.*—The bulbets should be planted in deep, rich soil, and covered about an inch deep. If the object is to raise the roots, the soil must be very deep, and the bulbets should be planted about a foot apart, in rows two feet from each other. If for ornament or covering a trellis, for which purpose they are excellently adapted, plant as you would Morning Glories or Scarlet Beans.

Propagating Clematis. J. B. T., *Salem, Oregon.*—Cuttings from the half-ripened young shoots made during the summer months root readily. In a small way, layering young shoots is the easiest and best. This should be done in summer just when the plants begin to blossom. The layers will be rooted by autumn, when they may be detached and transplanted, or left till the following spring, if more convenient.

Forget-me-not. Subscriber.—Seed sown now is not likely to produce flowering plants before next spring. It should have been sown last autumn. In THE AMERICAN GARDEN of September, 1884, you will find a special article on these lovely flowers. The questions about the arrangement of flower-beds are answered in the other parts of this number. Everyone interested in flowers should read Mr. P. B. Mead's paper, pages 120 and 121.

How to Make a Star. Mrs. J. T. L., *New York.*—There are but few positions to which a floral star is adapted, and unless it is seen from an elevation or from some distance, it will hardly give satisfaction. In designs of this kind, massive effects are most to be desired, therefore plants of one kind, and of decided colors, are chiefly to be relied upon. Scarlet Geraniums or *Coleus Verschaffeltii* are not excelled for this purpose.

Printed Daisies. Mrs. M. A. C., *S. C.*—These are in reality not Daisies proper, but annual Chrysanthemums. Great improvement has been made of late in these originally rather coarse plants, so that they are worthy of place in every flower border. They should be sown early in spring, and thinned out to one or two feet apart.

The "Paris Daisy," or "Marguerite," is an entirely different plant. It is a perennial, and is forced for winter blooming.

Sporting Geranium. Mrs. J. J. C., *Loogootee, Ind.*, writes: "In December I bought an Apple Geranium in bloom, a beautiful crimson semi-double flower, like a Zonal Geranium. After blooming the plant dwindled for awhile, revived, and bloomed again, but the flowers are the usual miserable little white flowers of the common kind." This apparent freak of nature is nothing very uncommon. Double flowers and abnormal colors produced by sports, do frequently return to their original types. Transplanting into rich ground during summer may restore the plant.

Squash Borers. H. L., *Auburndale, Mass.*—This is one of the most obstinate enemies to plant life in existence. The striped bug, which appears as soon as the plants come through the ground, can be kept off by placing over the hills light boxes, covered with mosquito netting, but the borers, which come when the vines are nearly full grown, which come when the vines are nearly full grown, which come when the vines are nearly full grown, are not so easily subdued. A great many remedies have been recommended, but we have found none better than Hammond's Slug Shot. It should be dusted over the stems early in the morning when they are wet with dew, once or twice a week, as soon as any signs of bugs appear.

OUR BOOK TABLE.

Prairie Experiences in Handling Cattle and Sheep, by Major W. Shepherd, R. E. Published by the Orange Judd Co., New York. A valuable work on the management of Herds, and the great Cattle Industry of the Western Plains. The author has had native experience, is a quick observer, and relates what he has seen and learned in an entertaining and instructive manner. His observations are careful and accurate, and the book will be found interesting to all, and of value to those now living, or intending to follow him, at the Far-West. Price, \$1.00.

Western, New York Horticultural Society. Proceedings of the Annual Meeting held at Rochester, Jan. 28th and 29th. The reports of the meetings of this model society are always full of highly valuable practical information, and this is no exception to the rule. In a beautiful address, president P. Barry reviewed the present condition and the progress of horticulture; the reports of the various standing committees contain a vast amount of carefully collected information; and among the most important papers read were: Agricultural Botany, by Dr. E. L. Starveant; Experiments in Special Manures for Grapes, by Prof. G. C. Caldwell; Lawns and Lawn Grasses, by Daniel Batchelor.

TRADE NOTES.

ITEMS OF GENERAL INTEREST FROM THE SEED, NURSERY AND FLOWER TRADE ARE SOLICITED.

The Niagara Grape is in demand from Canada to Texas, Maine to California.

J. A. De Veer, late of 318 Broadway, New York, has removed to No. 19 Broadway.

Nash & Brother report a great demand for the deservedly popular "Aeme" harrow.

The "King of the Garden" Lima Bean seems to be having something of a "boom" this season.

The Marlboro Raspberry has had a great sale, probably equal to the most conservative hopes of its introducers.

The nursery trade seems to have enjoyed a prosperous season. This is especially true of the liberal advertisers.

Hovey & Co., Boston, report a lively sale for the Early Orange Sweet Corn. We have tried this variety and liked it much.

Joseph Breck & Sons up to April 20 had sold over 10,000 bushels of seed Potatoes this season, of which a large proportion were Pearl of Savoy.

The late spring distributed the shipping season for seedsmen, so that the work was much less arduous than usual. But nurserymen had their work "all in a bunch."

Some seed houses, whose seeds are well known as No. 1 in quality, complain that while the number of orders is very large, yet their average size is below that of previous years.

James Viek says that whereas last year the seed orders of that house were small in average size, this season they are unusually large—which speaks well for the quality of his 1884 stocks.

W. Allee Burpee is quite enthusiastic over the outcome of the season's trade. He looks upon the present success as the legitimate result of the hard work and good seeds of previous years.

Benjamin Hammond of Fishkill-on-Hudson, N. Y., reports a lively demand for his now famous insecticide, "Slug-Shot." The very warm weather in April is conducive to a vigorous insect life, and we had better look out for the pests.

E. H. Chamberlain of Augusta, Arkansas, has a 200 acre fruit farm there, and wants an intelligent, practical man to take an interest in and management of it, as he is incapacitated by rheumatism. Arkansas offers great opportunities to the fruit grower.

J. A. De Veer, the gentlemanly agent of the General Bulb Company of Holland, and his energetic assistant, Mr. Boomkamp, won a great victory at New Orleans, carrying off the gold medal, four silver medals, and over \$410 in cash prizes for their exhibits of flowering bulbs.

The rather numerous failures in the seed trade during the past two or three years, indicate that the era of poor seeds and great profits is at an end. Good seeds, moderate prices, cheaper catalogues and low expenses generally, must now be the rule of action with those who would succeed.

CATALOGUES RECEIVED.

W. W. Hilborn, Arkona, Canada. Catalogue and Price List of Small Fruits.

Arthur E. Rendle, New York. Circular of "Rendle's Acme Glazing" for greenhouses.

Edwin Fewkes, Florist, Newton Highlands, Mass. Price list of Chrysanthemums.

E. B. Underhill, Poughkeepsie, N. Y. Berry Leaf. Price List of choice Small Fruit plants.

Compagnie Continentale d'Horticulture, Gand, Belgium. Price List of Vegetable, Flower and Field Seeds.

Arthur Bryant, Princeton, Ill. Illustrated Circular of the Salome Apple, remarkable for its keeping qualities.

Lewis Roesh, Fredonia, N. Y. Catalogue of Grape-vines and Small Fruits. Colored plate and many illustrations.

Isaac F. Tillinghast, La Plume, Pa. Catalogue of Vegetables and Flower Seeds. Puget Sound Cabbage Seeds a specialty.

F. N. Lang, Baraboo, Wis. Catalogue of northern grown Seeds. Also description and illustration of Lang's Hand Weeder.

F. K. Phoenix & Son, Delavan, Wis. Price List of fruit and ornamental trees, small fruit plants, etc. Root grafts a specialty.

W. E. Bowditch, Boston. Illustrated Descriptive Catalogue of Garden and Flower Seeds, also Greenhouse and Bedding Plants.

George S. Josselyn, Fredonia, N. Y. Catalogue of American Grape-vines and Small Fruit plants. The Empire State Grape a specialty.

J. M. Ayre, 130 Dearborn street, Chicago, Ill. Descriptive Circular of the Diamond Ventilator for public buildings, dwellings, refrigerators, cars, etc.

Bush & Son & Meissner, Bushberg, Mo. Semi-annual Price List of American Grape-vines. This is one of the largest Grape nurseries in the country.

Bowker Fertilizer Co., Boston and New York. Issue an interesting pamphlet on the Stockbridge Manures, giving many reports of remarkable crops grown upon these fertilizers.

Johnson & Stokes, Philadelphia. Garden and Farm Manual. A very complete list of all the best new and old vegetable and flower seeds. The Market Champion Tomato a specialty.

S. Pennock & Sons Co. Kennett Square, Pa. Catalogue of improved Road Machinery. These machines are renowned for simplicity, durability and cheapness as general road-workers.

Pratt Brothers, Rochester, N. Y. Descriptive Circular and beautiful colored plate of Empire State Grape now introduced by this firm. This is one of the most promising white Grapes yet introduced.

Buist's Garden Seeds, Philadelphia, offered in the new Catalogue sent out this year, have long held an enviable position for excellence and purity. The Belle Tomato is one of the novelties of the line.

John G. Burrow, Fishkill, N. Y. Illustrated catalogue of Grape-Vines, Small Fruits, etc., with some excellent introductory hints on Grape-growing, and accurate descriptions. Jefferson a leading specialty.

A. M. Purdy, Palmyra, N. Y., sends out a bright catalogue of everything in the Small Fruit line. The cover has colored pictures of his leading specialties, the Crimson Beauty Raspberry and the Jubalo Strawberry.

Hance & Borden, Rumson Nurseries, Red Bank, N. J. Catalogue of fruit and ornamental trees, shrubs, vines, small fruit plants, etc. Meach's Prolific Quince, and Mulberries for silk and ornamental stock are specialties.

Arthur E. Rendle, Corner Broadway and Wall Sts., New York. Patent "Acme" Glazing. This system consists in glazing without putty and was used on the largest conservatory in the world, Horticultural Hall at New Orleans.

Hule Brothers, South Glastonbury, Conn. Catalogue of Small Fruit plants, Fruit-trees, etc., containing a complete list of all the best new and old varieties. This firm makes a specialty of "Pedigree Stock," never using plants from old and worn-out fruiting beds.

THE AMERICAN GARDEN PRIZES OF \$1,000

For New Fruits, Flowers and Vegetables.

For the promotion of horticulture, THE AMERICAN GARDEN offers the following prizes of \$100 each, or silver plate of equal value. No varieties now upon the market to compete.

(a.) The prizes for fruits to be awarded by a committee or committees, chosen by or from the American Pomological Society; the awards to be made in the fall of 1886 or at such time as the committee may decide that the conditions shall have been met.

(b.) The vegetables to be exhibited at the next two annual meetings of the American Horticultural Society and at the fall exhibitions of two or more State societies; the prizes to be awarded in the fall of 1886, by a committee chosen by or from the American Horticultural Society.

(c.) The flowering plants to be exhibited at two meetings of the Society of American Florists, and of the New York and Massachusetts Horticultural Societies in 1885 and 1886, and the prizes to be awarded by a committee chosen by or from the Society of American Florists.

(1) For the best Grape which shall combine territorial adaptability and superior shipping qualities, with superior table quality; \$100 or plate. To be exhibited at the next meeting of the American Pomological Society, and at two or more State exhibitions for two or more years.

(2) For the best Strawberry which shall combine territorial adaptability and superior shipping qualities, with superior table quality; \$100 or plate. To be exhibited at the next two June meetings of the New York and Massachusetts Horticultural Societies.

(3) For the best Raspberry which shall combine hardiness, productiveness and superior shipping and table qualities; \$100 or plate. To be exhibited at such times and

places as the committee may decide.

(4) For the best Gooseberry, which shall combine large size, productiveness and freedom from mildew. To be exhibited same as (3.) \$100 or plate

(5) For the best Blackberry which shall combine large size, good quality, hardiness and productiveness. To be exhibited same as (3.) \$100 or plate.

(6) For the best New Fruit, (a new species is required) to thrive north of Virginia and Kansas, \$100 or plate. To be exhibited at two or more State or National Society meetings for two years in succession.

(7) For the best new Potato which shall combine superior quality, productiveness, freedom from disease. To be exhibited as above, (b.) \$100 or plate.

(8) For the best new Vegetable other than Potato (either a new variety or species), table and shipping qualities, and profitableness of culture to be considered. To thrive north of Virginia and Kansas. To be exhibited as above, (b.) \$100 or plate.

(9) For the best flowering Shrub, which shall be hardy in the Northern States east of the Rocky Mountains. To be exhibited as above (c.) \$100 or plate.

(10) For the best herbaceous Perennial flowering plant, which shall be hardy in the Northern States east of the Rocky Mountains. To be exhibited as above (c.) \$100 or plate.

We reserve the right to modify the above conditions in such manner as may appear to be for the greatest benefit to American Horticulture.

We invite correspondence and suggestions on the above offers to the end of making them as useful as possible.

We shall make no claims or conditions whatsoever that would influence the naming or disposition of the prize-winning varieties.

The competition is open to North America.

GOOD TO ALL WHO READ.
Good Luck with Fruits, Flowers and Vegetables.
LUCK Good Luck in the Garden, Orchard and Vineyard.

To all who read THE AMERICAN GARDEN.

Please tell all your neighbors that THE AMERICAN GARDEN will be sent to any address from JUNE to DECEMBER, inclusive, for only 50 cts.

I have found it of much benefit in my amateur efforts in the garden and conservatory. I shall take pleasure in recommending it to all who are similarly interested.—Jno. Mc Laren, Orono, Maine, Canada.

I did not hesitate to subscribe when I saw Mr. Falconer's name. He has answered many questions for me, that have been a great help to myself and many others. I will try to get you some subscribers. Your paper has been much improved since I saw some copies a year or two ago.—Miss Jennie Devoes, Morgan Co., Ill.

Since the change of management, several months ago, this magazine has shown steady improvement. It is a model of typographical neatness.—Hearth & Hall.

The offer of the Marlborough and The American Garden ought to bring you 10,000 subscriptions this month.—Cornelius Powers, Lorain Co., O.

See advertisement of the Extra Early Orange Sweet Corn, by Hovey & Co., on page 131.—Adv.

To secure summer boarders, the Boston Daily Transcript is the best advertising medium. It is the leading family paper. Send for rates.—Adv.

The above is a view of a fine place made beautiful by use of a choice selection of lawn grass seed-mixture and good care. A fine lawn may be the most attractive feature of any place, and may redeem an ugly house by its own beauty. We have made many experiments to make the best mixture of grass seeds for permanent lawns, and can safely say ours is unsurpassed for either lawns, parks, or grass plots. On each package will be found explicit instructions for sowing and care of the lawn. Prices: Fine mixed Lawn seed, quart, 20 cts.; peck, \$1.00; bushel, \$3.50. Extra fine (Boston Park mixture), quart, 30 cts.; peck, \$1.25; bushel, \$4.00. Joseph Breck & Sons, 51 to 53 North Market Street, Boston, Mass.

100 CHOICE BEDDING PLANTS for \$5.00.

Do you want a token from the Nation's capital? If so, order a collection of the following splendid bedding plants, of which we grow and sell in Washington annually over 150,000 of only the very best kinds.

For any place where there is an express office, we advise sending them by express, as we thereby are enabled to send much larger plants, buyer to pay charges. Otherwise we send usually from two-inch pots, free by mail.

For \$1.00 we send:—Any 12 plants of the following sorts in varieties:—Begonias; Bonvardias; Carnations, monthly; Fuchsias; Lantanas; Pansy, finest, and Salvia splendens.

Any 15 of Alternantheras, Achyranthus, Coleus, Chrysanthemums, Heliotropes, Verbenas, Geraniums, double, single or scented, and white-leaved,—15 of above basket plants for \$1.00.

Any 20, in varieties, of Petunia, single; Phlox Drummond; Gladiolus and Tuberosc bulbs, for \$1.00. 12 Everblooming or eight hybrid Roses for \$1.00. 100 plants in varieties, except Roses, \$5.00.

N. STUDER, Florist, WASHINGTON, D. C.

FOR 50 CENTS

I will send to any reader of the AMERICAN GARDEN, postpaid, 2 Pearl Tuberoses, 2 Verbenas, 2 Heliotropes, 2 Fuchsias, 1 double and 1 single Geranium, 2 Fancy German Pansies, 1 Lobelia and 1 Neriembergia, or 6 Verbenas, 3 Heliotropes and 3 Cupheas. I grow only the best sorts, do my own work, have no rents to pay, heat by steam, and have every facility for the business, is why I can sell so cheap. My plants speak for themselves. Try them. BEAUTIFUL EVER-BLOOMING ROSES!

Our choice IMPORTED ROSE PLANTS are two and three years old, and from one to four feet high. They will produce 20 to 40 flowers on each bush the first season. Only the best varieties are sent out, and all are carefully labelled, Directions for planting and treatment are sent with each order. The roses we offer are those which florists buy to force for cut flowers for spring sales. They are far superior to the little blugs sent out by some dealers in two and four inch pots. Prices: 10 strong plants, \$1.50; 25 plants, \$3.50; 50 plants, \$6.50; 100 plants, only \$12.00. Standard Tree Roses, \$5.00 per doz. Send orders to

Mention THE AMERICAN GARDEN.

The Marlboro Raspberry

With all the other varieties growing here, and with a knowledge of those catalogued throughout the world, we claim that the Marlboro has not an equal in desirable quality. We have invited all interested to come and see it, and neighbors and strangers with a single exception bear us out in the above statement. Interested parties and partisan journals may continue their misrepresentations. We say, come and see its earliness, its hardiness, its great growth of bush and unequalled size and perfection of all the berries. We also want you to eat it and try its solidity. Part of the crop was sent to Montreal, 450 miles by rail, in good order. First shipment brought 60 cents per quart, wholesale in New York, and ruled higher throughout the season than any other variety. Our new seedling grape, the

ULSTER PROLIFIC,

In hardiness, mildew and rosebug proof, and unequalled quality with its great bearing habits, much pleases the most difficult. The refinement of our seedling the

PO'KEEPSIE RED,

its earliness, growth and productiveness is already known to the country. The high quality of our white grape

Duchess,

is so generally acknowledged that it no longer needs a description. Vineyardists are now planting it by the thousand. Send for circulars. Our recent hardy seedling blackberry, the Minnewaski, is not yet catalogued or priced, but will be ready next fall.

WHITE INK.

Sectional View.

THE "PLANET JR" HOLLOW STEEL STANDARD HORSE HOE, NEW
As lately introduced, has no equal in the world. Its excellent work in the field has distanced that of all competitors. It is, in some sections, doing in one passage, the work of four or five old-style implements, and in others superceding the cumbersome and expensive two-horse tools. The "PLANET JR" HAND SEED-DRILLS and WHEEL HOES are the newest and best, lightest and strongest known. There are 7 distinct tools, each with special merits, no two alike or the same price; all practical and labor-saving. Let no Farmer or Gardener fail to study up during the winter evenings our 1885 CATALOGUE, which gives reduced prices, careful and exact engravings of these different machines, and such descriptions as will enable the reader to judge correctly of their merits. Thirty pages and Forty engravings. Free to all. Correspondence solicited.
S. L. ALLEN & CO., MANUFACTURERS, 127 and 129, CATHARINE ST., PHILADELPHIA, PA.

"ACME" PULVERIZING HARROW, Clod Crusher, and Leveler.
AGENTS WANTED.
It is the best selling tool on earth.

The "ACME" subjects the soil to the action of a **Steel Crusher and Leveler**, and to the **Cutting, Lifting, Turning** process of **DOUBLE GANGS OF CAST STEEL COULTERS**, the peculiar shape and arrangement of which give **immense cutting power**. Thus the three operations of **crushing lumps, leveling off the ground and thoroughly pulverizing the soil are performed at the same time**. The entire absence of **Spikes or Spring Teeth** avoids pulling up rubbish. It is **especially adapted** to inverted soil and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that **cuts over the entire surface** of the ground.

Variety of Sizes, 4 to 15 feet wide.—We deliver free at our distributing depots.
DO NOT BE DECEIVED. Don't let dealers palm off a base imitation or some inferior tool under the assurance that it is better, but **SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL.** We will send a Double Gang Acme to any responsible farmer in the United States, and if it does not suit, he may send it back, we paying return freight. We don't ask pay until tried on his own farm.
Send for Pamphlet containing Thousands of Testimonials from Forty-eight different States and Territories.

Mention THE AMERICAN GARDEN.

DAKOTA RED POTATO!

The publisher of THE AMERICAN GARDEN, then specialist to Hiram Sibley & Co., in a test at Rochester, N. Y., in 1883, found this to be the MOST PROLIFIC OF ANY OF 125 VARIETIES, and equal in quality to any of them.

Last season it again yielded enormously. From one pound of seed, H. C. Pearson, N. Y., grew 2,558 lbs.; A. Rose, N. Y., 2,349 lbs.; G. P. Thompson, N. H., 2,115 lbs.; Chas. C. Miller, O., 1,677 5-7 lbs.; G. W. P. Jerrard, Me., 1,638 1-4 lbs.; E. H. Vick, N. Y., 1,320 1-2 lbs.

These yields are certified to by Wm. Hamilton, Calcutta, X. Y., President of Western New York Agricultural Society; James S. Grinnell, Greenfield, Mass., formerly Acting Commissioner of Agriculture, at Washington, D. C.; John E. Russell, Boston, Mass., Secretary of State Board of Agriculture, Massachusetts; L. P. Roberts, Professor of Agriculture at Cornell University, Ithaca, N. Y., committee.

These enormous yields of potatoes, grown from one pound of seed by careful cultivation and with the liberal use of a high grade fertilizer, are worthy the consideration of all interested in the culture of the potato, or in the possibilities of reproduction in the Vegetable Kingdom. 2,558 pounds from one pound of seed greatly surpasses, we believe, anything heretofore recorded in the culture of the potato. That more than a ton and a quarter, or 42 1-2 bushels, should be grown from one pound of seed is truly marvellous. (Report of Committee.)

My seed is direct from the originator, and my stock is warranted genuine. (Only selected tubers are sent out.)

I refer by permission to the publisher of THE AMERICAN GARDEN.

PRICES—Pound, by mail, 75 cts.; peck, by express or freight, \$1.50; bushel, \$5.00.

WM. YOUNG, Jr., Hopkinton, Mass.

CABINET STYLE.

The Records Show That the Butter-Yield of the COOLEY CREAMERS

has never been equalled by any creamery, pan, or separator. They carried off the premiums for the GREATEST PER CENT OF YIELD in the great dairy States of Iowa and Wisconsin. Their combined products of butter and cheese reaching nearly sixteen pounds to the hundred pounds of milk. They take the lead in the CREAM GATHERING SYSTEM.

ELEVATOR STYLE.

THE DAVIS SWING CHURN. AWARDED SIX SILVER MEDALS

in the last four years over all competitors. Because it operates the easiest. Because it churns more thoroughly, and consequently makes the most butter. Because it is the easiest to clean. Because the cover is always on top, avoiding all leakage and emptying the cream on the floor, as is frequently the case with revolving churns. Send for Illustrated Circulars.

ANY LADY OR GENTLEMAN, BOY OR GIRL, may easily make a few dollars in a few hours by obtaining subscriptions from among acquaintances to the easiest of all publications to canvass for— one which sells itself—the new magazine edited by Marion Harland and Dr. Yale, devoted to the care of infants. (It is the only periodical in the world of its kind, and should not be confused with "juvenile" magazines devoted to the amusement of children.)

The New York Tribune has just said of it: "BABYHOOD grows more admirable with every successive number. It is full of good sense and the wisest instruction, which cannot fail to be appreciated by all who have the care of children;" and the Boston Transcript: "This little periodical, we are glad to know, has already met with a large degree of public favor, and when its character and real value come to be more generally known, no mother of a young family will feel like being without it."

There are probably a few subscribers in your locality, already, and the magazine has doubtless become favorably known. The only reason it is not taken by large numbers of parents is that it has not been brought directly to their notice by a suitable canvasser. If you will, you will be surprised at your success, and BABYHOOD will remunerate you liberally for the services rendered. Send for terms and sample copy to BABYHOOD, Box 3122, New York.

The Baltimore Telegram says of the subscription price (\$1.50): "We are sure it will be money saved to those over in any house living the bliss to own a baby."

"THE HORTICULTURAL DIRECTORY" OF THE UNITED STATES IS NOW READY FOR DELIVERY.

WE have endeavored to compile as perfect a book as possible, and have been over sixteen months engaged therein. The addresses have all been tested, and the book is as accurate and complete as it is possible for human skill and patience to make it. We believe that it will be an invaluable guide for the trade.

PRICE, \$6.00 PER INTERLEAVED COPY.

Please remit amount in Registered Letter, P. O. Order, or Postal Notes, and book will be sent by mail, postage paid; or, by Express, C. O. D., at purchaser's expense.

CHARLES F. EVANS, Editor, Rowlandville Nursery, Station F, PHILADELPHIA, PA.

SUPPLEMENT A.

IT is the intention to have ready for delivery at the same time as "The Horticultural Directory of the United States," "SUPPLEMENT A," which will be a list giving the names and post-office addresses of the Nurserymen, Florists, Fruitgrowers, and Seedsmen of England, Ireland, Scotland, Wales, and the Channel Islands, comprising in all about two thousand addresses. The Supplement will be issued in pamphlet form, and will be sold to subscribers to the "HORTICULTURAL DIRECTORY" at one dollar (\$1.00) per copy; to non-subscribers at one dollar and fifty cents (\$1.50) per copy, postage paid. The trade must bear in mind that the rate of postage to points covered by the Supplement is only one cent for unsealed circulars weighing not more than two ounces. The business in Horticulture between the two English-speaking countries is yet in its infancy, but is growing rapidly.

SUPPLEMENT B

WILL be issued April 15, 1885, and will comprise the names and addresses of the principal Nurserymen, Seedsmen, and Florists of Austria, Bavaria, Belgium, Denmark, France, Germany, Holland, Hungary, Italy, Poland, Russia, Saxony, Sweden and Norway, Switzerland, Wurtemberg, Brazil, India, Japan, Australia, New Zealand, and South Africa. Price, same as "Supplement A." Subscriptions and remittances must be made to

STANDARD GUARANTEED.

Unequaled Mechanical Condition.

HIGHEST GRADE MATERIALS USED. A Complete Manure for All Crops.

REASONS WHY Bradley's Superphosphate

Has Maintained its Supremacy for 24 Years.

- BECAUSE** it has been the constant aim of the manufacturers to make it THE BEST IN THE MARKET.
- BECAUSE** it contains all the requisite elements of plant-food, derived from sources and combined in proportions, proven by the practical experience of 24 years to best constitute a WELL-BALANCED COMPLETE MANURE, FOR GENERAL USE ON ALL CROPS.
- BECAUSE** the materials of which it is composed are selected with reference not only to their chemical composition, but especially TO THEIR CROP-PRODUCING POWERS, WITHOUT REGARD TO COST.
- BECAUSE** the greatest attention is given to its manufacture to secure uniform quality and condition, all the raw materials, as well as the manufactured product, being daily analyzed by competent chemists. Thus there is no guess work, EVERYTHING BEING REDUCED TO A SCIENTIFIC BASIS.
- BECAUSE** its composition is based on no foolish theory, but on those principles of feeding plants which are recognized by the highest authorities at home and abroad as the only practicable and profitable methods of RETURNING TO THE SOIL THOSE ELEMENTS EXHAUSTED BY THE CROPS.

Our patrons, whether agents or farmers, are invited to visit our factories and SEE FOR THEMSELVES HOW OUR FERTILIZERS ARE MADE.

PAMPHLETS FOR 1885 SENT FREE ON APPLICATION.

E. P. CARPENTER ORGANS

LATELY MANUFACTURED AT WORCESTER, MASS., ARE NOW MADE IN

BRATTLEBORO, VT.,

Where the Business was Originally Established in 1850.

OUR ORGANS CONTAIN THE
CELEBRATED CARPENTER ORGAN ACTION,
which is guarantee of their superior excellence.

An Honest Organ.

"The Carpenter Organs have won for themselves a high reputation for durability, and fine musical qualities. An organ may be fine in appearance, but unless it is built honestly in every part it will prove unsatisfactory. Mr. Carpenter makes most emphatically an *honest organ*; and this is, we think, the secret of their popularity."—*Youth's Companion.*

WARRANT.

Each Organ containing the Carpenter Organ action is warranted to be made in the most skilful manner, of the best and most perfectly prepared material, and to be, according to its size, capacity and style, the best instrument possible. Each purchaser is given a *written guarantee* for eight years.

Where we have no Agent,

E. P. CARPENTER CO., BRATTLEBORO, VT., U. S. A.

The Mapes Complete Manures

REDUCED PRICES.

For Potatoes—Use the Mapes Potato Manure—3 to 10 bags per acre. The largest yields of potatoes on record were grown by E. S. Carman, Editor Rural New Yorker, with this Manure. During last year Dr. W. S. Combs, Freehold, N. J., grew on one acre 528 bushels, and on 14 acres, 4,480 bushels. No rot; quality very superior. This manure is also specially recommended for Asparagus, Beets, Mangolds, Early Turnips, and may be used on all early truck and vegetables. It is not quite so forcible as the next following manure.

For Vegetables—Onions, Tomatoes, Cucumbers, Melons, and all truck, use the Mapes Complete Manure (for general use). Four to 10 bags, per acre, broadcast, raking, or harrowing in. Theo. F. Baker, Camden, N. J., President N. J. Horticultural Society, and one of the largest and most successful truckers, reported 2,700 bushels onion sets on 12 acres. He claims a saving of \$20 per acre from combination of fertilizer with stable manure over stable manure alone, and superior results, earlier and better quality; also larger yield from fertilizer alone than from stable manure alone.

For Fruits—Strawberries, Raspberries, Grape Vines and all Fruit Trees, use in early Spring the Mapes Fruit and Vine Manure.

Prices on Cars or Boat.
Per ton 2,000 lbs. Per bag 200 lbs.
\$48.00 \$4.80

One hundred pounds to 2,000 square feet—work in around trees as far as the branches or roots extend. This manure is for increasing the fruiting power of trees and vines. If a fertilizer is desired for making more rapid wood growth, the Potato Manure may be used in the same way as the Fruit and Vine Manure.

For Cabbage and Cauliflowers—Use the Mapes Cabbage and Cauliflower Manure—five to 10 bags per acre. This manure is used largely, and to the exclusion of stable manure, by many of the Cauliflower growers at Mattituck, L. I., and by cabbage growers at east end of Long Island and elsewhere.

For Tobacco—Use the Mapes Tobacco Manure—eight to 10 bags per acre.

For Sweet Corn, Field Corn, and Corn Fodder, use the Mapes Corn Manure—three to four bags per acre.

For Turnips (late)—Use the Mapes "A" Brand Manure. This is also an excellent fertilizer for using in the hills or rows for all crops—it is very safe.

For Grass Top-Dressing—Pastures and Lawns—Use the Mapes Grass and Grain Spring Top-Dressing—one to three bags per acre. This is much superior to stable manure for spring application, particularly around dwellings, croquet-grounds, and lawns.

Prices on Cars or Boat.
Per ton 2,000 lbs. Per Bag 200 lbs.
40.00 4.00
45.00 4.50
50.00 5.00
46.00 4.60
40.00 4.00
47.00 4.70

These Manures permanently improve the land by adding to its stock of plant food, the same as stable manure. The decaying roots of most of the crops keep up sufficient supply of vegetable matter in the soil. Seven successive crops have been grown from a single application to a potato crop on poor land, and all the crops showed large increase over natural soil.

Freights.—By reason of present competition between the leading transportation lines, we can often ship at very favorable rates, particularly in car-load lots. Those ordering from us, even by the single bag, may rely upon our securing the lowest rate possible. Send postal for pamphlet on manures for all crops.

PRACTICAL POULTRY KEEPING
FOURTH EDITION.
AN ILLUSTRATED BOOK ON POULTRY.
How to Breed and Manage
HENS, TERREYS, DUCKS and GESE.

For EGGS, MARKET, and EXHIBITION.
PLATES SHOWING the FOWLS in COLORS

Plans and diagrams of Poultry Houses, large and small. Diseases and their remedies. A description and history of all the leading varieties of fowls, with illustrations. Incubators: how to make and manage them. Capons, and how to produce them.

The book has many good testimonials of purchasers, and of such papers as the Farm and Fireside, Rural Home, and Gospel Banner. The New York Weekly Tribune says of it: "It is just what every one needs who keeps a dozen fowls." The Poultry Messenger says: "It contains all that is valuable to the farmer or fancier for both pleasure and profit. One of its chapters, 'A Word to Beginners,' is worth, to old and new, the full price asked."

Sent by mail, with catalogue and price list of eggs, paper cover, 50 cents; three copies, \$1.25. Nicely bound in cloth, 75 cents; two copies, \$1.25. Postal Note preferred. Stamps taken. Address

G. M. T. JOHNSON, Box 17, Blughampton, N. Y.

N. B. I send eggs of choice poultry to all parts of the United States and Canada with perfect success. I sell the Perfect Hatcher and Brooder.

EGGS. B. & G. S. Hamburgs & Wyandottes 12 for \$2. 20 for \$5. B. Leghorns, P. Rocks, P. Ducks, \$1 per sitting. From Stock Fresh and True to name. Fowls for sale. Send stamps for reply, mentioning this paper. J. P. HEELINGS, Jenkintown, Montg'y Co., Penna.

Experienced editor of 27 years. Send for a sample with 18 cents in stamps. Subscription, \$2.00 per year. Try it for a year. Address CHAS. H. MAROT, 814 Chestnut St., Phila.

Mention THE AMERICAN GARDEN.

STOCKBRIDGE POTATO FERTILIZER.

The above cut shows the quality of the Potatoes which were exhibited last fall at Horticultural Hall, Boston, and took the Premiums which were offered for the Largest and Best Yield raised on the STOCKBRIDGE POTATO MANURE:

1st PRIZE.—178 Bushels from 1 Bush. Seed, or 712 BUSHELS Per Acre.

On the 26th day of May, 1881, I planted one bushel of 60 lbs. of the "Pearl of Savoy" Potatoes on a new piece of ground that had been ploughed the previous fall, the rocks and stumps having been removed from it, and the ground thoroughly harrowed and prepared, Stockbridge Potato Manure was drilled in with a machine which opened the furrows and mixed the fertilizer with the soil, and left it very small, so small that some of them failed to grow, but most of them came up, and made thrifty plants. The rows were three and one-half feet apart, and sets about 15 inches in the rows. The potatoes were cultivated two or three times with a horse hoe, and once by hand; also weeded once by hand. They were dug and drawn to the barn, and carefully weighed and measured, and turned out 10,680 pounds. I send you an average sample of the crop, showing them to be free from grubs or rot, and of good size. We did not get over a handful of small potatoes out of 100 bushels.

Subscribed and sworn to before A. G. COMINGS, Justice of the Peace.

For Pamphlets ask our local agents, or send to

BOWKER FERTILIZER CO., BOSTON and NEW YORK.

BURPEE'S EMPIRE STATE POTATO,

Now offered for the first time, in doubtless the best and most productive Main Crop Potato ever introduced. It is strikingly beautiful; skin white and smooth; eyes shallow, but strong; flesh pure snowy white and of peculiarly rich and delicate flavor. Of vigorous growth, the tubers cluster compactly in the hill. It is enormously productive, having yielded at the rate of nearly 600 bushels per acre, and thoroughly tested along-side of the most popular varieties. Burpee's Empire State has, in every case, outyielded all others. Prices: pack, \$1.50; bushel, \$5.00; barrel, \$10.00. By mail, 75 cts. per lb.; 3 lbs. for \$2.00, post-paid. For full particulars, illustrations and testimonials, see BURPEE'S FARMER'S ANNUAL FOR 1885, which will be sent free to any address.

W. ATLEE BURPEE & CO., Philadelphia, Pa.

The American Garden Prizes of \$1,000.

For New Fruits, Flowers and Vegetables.

For the promotion of horticulture, The AMERICAN GARDEN offers the following prizes of \$100 each, or silver plate of equal value. No varieties now upon the market can compete. Plants or seeds are to be sent to the committees for growing in their own grounds for trial, under restrictions not to be propagated or sold. The prizes are to be awarded to the originators.

(a.) The varieties put in competition are to be shown at three or more State, National, or other equally important exhibitions, in 1885 and in 1886, under the rules of the societies where exhibited. The awards will be made by committees—chosen from among members of the American Pomological Society for fruits, American Horticultural Society for vegetables, Society of American Florists for flowering plants—in the fall of 1886, or at such times as the committees shall decide that the conditions have been met.

(1) For the best Grape which shall combine territorial adaptability with superior shipping and table qualities. A vine with the current year's growth, a portion of the previous year's growth, with all fruit and foliage growing thereon intact, and at least six bunches of grapes shown separately, to be exhibited as above (a). \$100 or plate.

(2) For the best Strawberry which shall combine territorial adaptability with superior shipping and table qualities. A plate of not less than 50 berries, and three plants with all roots, foliage and fruit intact, to be exhibited as above (a). \$100 or plate.

(3) For the best Raspberry which shall combine hardiness, productiveness and superior shipping and table qualities. Same conditions as for (2). To be exhibited as above (a). \$100 or plate.

(4) For the best Gooseberry which shall combine large size, productiveness and freedom from mildew. Same conditions as for (2). To be exhibited as above (a). \$100 or plate.

(5) For the best Blackberry which shall combine large size, good quality, hardiness and productiveness. Conditions as for (2). To be exhibited as above (a). \$100 or plate.

(6) For the best New Fruit (a new species is required) to thrive north of Virginia and Kansas. To be exhibited as above (a). \$100 or plate.

(7) For the best new Potato which shall combine superior quality, productiveness, and freedom from disease. One peck to be exhibited as above (a). \$100 or plate.

(8) For the best new Vegetable other than Potato (either a new variety or species), table and shipping qualities and profitableness of culture to be considered. To thrive north of Virginia and Kansas. To be exhibited as above (a). \$100 or plate.

(9) For the best new flowering Shrub which shall be hardy in the Northern States east of the Rocky Mountains. To be exhibited as above (a). \$100 or plate.

(10) For the best new herbaceous Perennial flowering plant which shall be hardy in the Northern States east of the Rocky Mountains. To be exhibited as above (a). \$100 or plate.

We shall make no claims or conditions whatsoever that would influence the naming or disposition of the prize-winning varieties.

The competition is open to North America.

The names of the committees will be announced as soon as the lists can be completed.

The above conditions will not be modified, except, possibly, to simplify them.

We invite suggestions, to the end of making the above offers as useful as possible.

Parties intending to compete are requested to inform the undersigned, for record.

Reports of judges on any new fruits, flowers, or vegetables at any exhibition in America are solicited. (Signed) E. H. Luby, Greenfield, Mass., May 1, 1885.

THE GREAT CALIFORNIA INSECT POWDER.

Perfectly Harmless to Animal and Plant Life. Manufactured from the pure Pyrethrum Cinerariæ Folium Blossoms grown by us in California, where "Buhach" is Manufactured and Canned.

BUHACH has been carefully experimented with and has received the unqualified endorsement of the most eminent scientists and entomologists in this country, among whom we quote: Prof. C. V. Riley; Prof. A. J. Cook; Prof. E. W. Hilgard, University of California; Prof. J. Henry Comstock; Prof. Matthew Cook, late Chief Horticultural Officer of California; Prof. W. A. Henry; Elbert S. Carman, Editor "Rural New-Yorker," New York; A. S. Fuller; Dr. F. M. Hexamer.

The Dreaded Rose-Bug, impervious to Paris Green and all other Arsenical Compounds, gives up the ghost to **BUHACH**.

BUHACH POWDER will kill Rose-bugs. Last year it was blown upon them through bellows. This year we propose to use a Buhach extract, made by dissolving four ounces of the powder in a gill of alcohol and then adding one gallon of water, applied with force pump and "cyclone nozzle." We do know that Buhach will kill cabbage worms and the dreaded rose-bug.—*Rural New-Yorker*, April 25, 1885.

CABBAGE WORMS AND POTATO BEETLES. Prof. A. J. Cook says: I found Buhach efficient in destroying the Colorado potato beetles, the caterpillars of the cabbage butterfly and plant lice.

SLUGS, CATERPILLARS, GRUBS, ETC., ETC. I find it very fatal to slugs, caterpillars, grubs, flies, mosquitos, and both parasitic and plant lice.—*A. J. Cook, Entomological Laboratory, Agricultural College, Lansing, Mich.*

BUHACH, Safe and Sure Insecticide. I have been surprised by the effect produced on the hairy Tent-caterpillar by water containing the extract of 1 lb. of powder to 50 gals. They paid little attention to the bellows and powder, at least when the wind blew; but a sprinkle of the diluted ex-

tract promptly caused them to squirm, drop off, and finally die while attempting to crawl away.—*E. W. Hilgard, University of California.*

THE CURRANT WORM. Buhach, extended with plaster 50 times, kills the currant worm.—*Rural New-Yorker.*

DR. F. M. HEXAMER says: The efficacy of Buhach is so well known that its value as an insecticide is firmly established. We have lately experimented with it, and were highly pleased with the results. If properly applied it accomplishes all that is claimed for it, and has the great point in its favor that it is entirely harmless to human beings, as well as to house and farm animals.

MR. A. S. FULLER, Agricultural Editor "New York Sun," says: Some large climbing Roses that were badly infested with aphids and thrips were entirely cleared of their enemies by one dusting with **BUHACH**.

BUHACH is also an Absolute Specific for all insect pests of the household, such as Flies, Fleas, Mosquitos, Bed-bugs, Roaches, Water-bugs, Ants, Moths, Midges, Crickets, Spiders, Scorpions, etc., etc., etc.

PRICE OF BUHACH.—25 cents, 50 cents, 75 cents and \$1.25, according to the size of cans. Insufflators, 25 cents each. Sent by mail, post-paid, on receipt of price. Buhach is sold by Druggists, Grocers, Florists and Seedsmen out of our 6 lb. cans at \$1 per pound, or \$4.50 per can of 6 lbs. Force Pump with ten feet of pipe and ten feet of rubber hose and one Cyclone spray nozzle, complete, ready for work, price \$9.00. Extra Cyclone nozzles, each 75 cents. Bellows with attachments for dry applications, \$2.00. Bellows with atomizer attachment for applying Buhach solution, \$2.00.

If Buhach is not on sale in your neighborhood, send your orders direct to us. Be sure you get "Buhach" and that the can is an original package. Many dealers will insist on your trying "something better" or "as good." Don't take it. Stand firm, and use nothing but "**Buhach**."

Send for circulars, mentioning THE AMERICAN GARDEN.

No. 6.

The Vegetable Garden.

SEASONABLE HINTS.

Nearly all kinds of vegetables may still be sown and planted, and later even, for successive crops. It should be the constant aim of the gardener to have all his ground occupied as much as possible, that is, by useful plants. Weeds will soon enough occupy any land that is not kept under constant cultivation. Beets, Beans, Corn, Cucumbers, Melons, Squash, Peas, Potatoes, Salsify, Parsnips, and many other vegetables may be sown or planted this month.

Firming the Soil when sowing seeds is of far more importance than most persons are aware of, and many failures are the direct result of such omission. This fact was forcibly brought to our mind last year. We had sown two rows of Parsnips in very dry ground. One row had been firmly packed by walking on it, when a sudden shower prevented treating the other in the same manner, and supposing that the rain would have a similar effect, the soil was never packed. But our supposition proved erroneous. The first row came up quickly and vigorously, while the second sprouted very slowly and came up so poorly that it was thought not worth cultivating, and was afterwards spaded under and re-sown.

Dr. E. L. Sturtevant's experiments in this direction are highly instructive, and give unmistakable evidence of the great importance of firming the soil. Oftentimes, Corn that is planted early, says the Doctor, is put in the ground while the land is in a lumpy condition, and no pressure brought to bear to bring the soil in close contact with the Corn. The open spaces thus left about the seed tend to retard, and, under the varying conditions of heat and moisture, often destroy, the germinative process. So marked is its influence, that the per cent of germination by actual trial (as observed between two plats, both of which were planted at the same time, but upon one of which the soil was firmly pressed upon the seed with the foot, and upon the other the seed carefully covered by means of a hoe in the ordinary method) was largely in favor of the trodden plat. This trial was in accordance with a practical experience in farming, whereby it was found that the gain in crop through the use of a western Corn planter whose wheel compressed the soil over the seed as planted, compensated largely for the first expense of the machine.

Cucumbers for pickling are an important crop in various sections of our country. In the vicinity of New York the 20th of June is considered the correct time for planting the seed. A week earlier or later makes but little difference, except that in planting much earlier the vines are in danger of falling a prey to the striped bug. The principal conditions for a successful pickle crop are rich, rather moist soil, and perfect cultivation from the day the plants show themselves till the vines cover the ground. As soon as there are any pickles of proper size, they have to be pickled, or better cut off with a sharp, small knife or a pair of scissors, continuing to pick the vines *clean* every other day at the utmost; better every day during the height of the growing season.

SUCCESS WITH MELONS AT THE NORTH.

For a number of years I succeeded in raising good Watermelons by making a bed of sand. The sand was spread upon the surface of the ground, which was a clay loam, to the depth of six inches, and the seeds were planted in hills enriched with fine manure. Holes were dug through the sand and into the earth underneath. The bed of sand would last for a few years, when it would have to be renewed.

Last year I tried another plan, which proved more successful than the old one, and less troublesome. The Watermelon plants are started in the hot-bed, which is simply a frame with window sash over, and horse manure under to furnish the heat. The seeds are put into flower pots filled with sand and bedded into sand on top of the manure. When these plants come on they are thinned to one in each pot, and when they are large enough and the ground has become warm, they are transplanted into hills, in which finely rotted manure has been mixed with the soil.

The process of transplanting is very simple, as the plant is readily loosened in the pot and comes out with the sand and roots in a snug ball. The earth is firmly pressed around the plant and then a circle of sand about three feet in diameter is placed around it. Very little more attention is necessary, except to keep the weeds down. The hill of sand attracts the heat which is necessary to mature this semi-tropical fruit. A small pile of stones would answer the purpose very well. It is an advantage to plant the Watermelons on the south side of a stone wall, or a board fence, as they will reflect the heat of the sun.

The pots must not be filled with compost or manure, else worms may be bred in them which will destroy the plants while yet in the pots. Clear sand is the best. Under this plan the finest varieties of Watermelons may be had in abundance even in high latitudes. Muskmelons do not require so much heat, but may be advanced, and ripen earlier, by starting them in pots as described. A hill of sand around Muskmelons will also promote their growth and early ripening.

F. D. CURTIS.

MORE ABOUT SQUASHES.

The article in a recent issue of THE AMERICAN GARDEN on "The Squash and its Culture," was both interesting and instructive and suggested a comparison with my own experience.

Considering the number of new varieties, both early and late, introduced within the past few years, it is surprising that there has not been more decided improvement. It is a question, whether among all the new sorts, we have any that are really better adapted in quality or productiveness for general culture than the old varieties of twenty-five or more years ago. These old stand-bys,—the Summer Crookneck for early, Boston Marrow as intermediate, and Hubbard for general use,—have stood the test of time, and are yet more popular throughout the country than those of recent origin.

The Boston Marrow may have deteriorated somewhat in quality in the past few years, but in yield it is fully up to the old standard, and does not appear to have the tendency to "run out" which is so marked a

characteristic of some other vegetables. I would not by any means be understood as condemning all the new varieties of Squashes. There are some of evident merit, and these may be improved upon in time, while the older sorts may lose their vitality and become superseded by others.

I was very favorably impressed with the Olive, which I tested the past season. It is rather late in ripening, and as mine were not planted as early as they should have been, they did not mature properly, yet they grew to a fine size, and considering the unfavorable season, were of unusually good quality and kept very well; one specimen was preserved in perfectly good condition until February 3d. I have not tested the Pineapple, but several of my acquaintances who have, pronounce it watery and unpalatable.

The Perfect Gem seems to meet with favor in many localities, but it is absolutely worthless with us, in Vermont, and this is the verdict given it by others who have tested it in this locality.

W. H. RAND.

SWEET POTATOES IN KENTUCKY.

A loose, sandy soil is generally considered best for Sweet Potatoes, but here we prefer a rich, or moderately rich, firm soil. The ground is broken thoroughly, and well pulverized; then ridges are thrown up with a siding plow, from four to five feet apart, from middle to middle; then the whole is gone over with the hoe, the soil drawn up into a smooth, even ridge, a little flattened on the top. This work is done just as the slips are ready for setting, as then the soil is fresh and the plants will have the start of the grass and other weeds.

When the slips in the hot-bed are large enough draw them on an evening, have a puddle of dirt and water ready, into which stir well the roots, then plant them in the ridges, about eighteen inches apart, in holes made with a small wooden paddle or a trowel; then draw the soil to the plants, and press it firmly about the roots. No more need be done to insure their surviving, unless the weather is very dry and hot, then they should be watered for a few evenings.

So soon as the slips show that they are firmly established, and begin to grow, go over the ridges with a hoe, stirring the soil slightly, taking care to destroy all other growth. I never use the plow after throwing up the ridges; but stir the surface well with the hoe, and as often as the soil seems to need stirring or becomes weedy. This is done till the vines spread so as to prevent further cultivation.

The slips are raised in a hot-bed by throwing in first a layer of forest leaves, sufficient that when pressed down it will be five or six inches thick; then fresh stable manure over this to the depth of about a foot, pressed down. On this spread rich, loose, loamy earth; rake smooth; then press the Potatoes in this close together, but not so that they touch each other, then cover with rich loam, or compost. Earth may be thrown up around the sides of the frame to keep in the heat, though we seldom find this necessary. The bed should be covered against cold and rain, till the plants begin to appear, when it may be left open to the weather; but previous to this, as rain is excluded, the bed should be frequently watered with tepid water.

JAMES I. BAIRD.

MULCHING POTATOES.

We do not give the mulching of Potatoes that attention or practical experimental investigation it deserves. The Potato raiser above frost and insects, he suffers more financial loss from the heat and drought of our summers.

The Potato requires a moist soil and a cool season. Mulching would certainly tend to give both. I am pretty well convinced that planting deep or hoeing up the hills is beneficial, simply because it has somewhat the effect of a mulch—keeping the Potatoes in cooler, moister soil. Where the soil is moist and the climate cool, flat culture does best; this shows that because deep planting or hilling does best where the ground is dry or the weather hot, is simply because it is in effects not dissimilar to a mulch. I have noticed that Potatoes did better upon a stiff sod than upon a soil fully as rich but not soddy; and I think it is because the sods lying on top of the ground act as a mulch. We all know that for Potatoes clay soil is better than sandy soil. Why? Because it is colder and damper. Mulching would make the sandy soil colder and damper.

The cost is not great. Straw or vines are cheap. Most of us can get the materials for a mere pittance. Then the straw or vines are not lost by any means for they will manure the ground. Mulching saves hoeing. That is quite an item when you are compelled to pay for the labor, and a bigger item when you have to do it yourself. The man or boy never was, that liked to hoe Potatoes, especially on new land.

Among the experiments conducted at the Missouri Agricultural College by Prof. J. W. Sanborn, was one to determine what effect mulching would have upon Potatoes. The season was peculiarly unfavorable to an exhibition of the benefits of mulching. The experiments were conducted carefully. Plats of land lying side by side were marked off, and each alternate plat mulched. The others were cultivated in the usual manner. A mistake was made in mulching too heavily, so that quite a percentage of the plants failed to come through. Yet notwithstanding all the unfavorable circumstances the results were most gratifying to the advocates of mulching.

The total yield of Burbank Potatoes, mulched, was 50 per cent more than those not mulched; and while of the former the proportion of table Potatoes to those too small for use was as eleven to two, the proportion among the latter was only as four to one. The test upon Peachblows showed a difference in favor of the mulched Potatoes of 126 per cent on the total yield; and while the proportion of table to small Potatoes was as six to one among the mulched, it was only as three to two among the unmulched. If one swallow made a summer, then the one experiment at this Agricultural

College would prove the great profit of mulching for the Potato crop at least. But we want further tests. JOHN M. STAHL.

LONG STANDING SPINACH.

A most serious objection to the summer cultivation of Spinach, is the inclination of the older kinds to go to seed quickly in warm weather. It is from this cause, more

LONG-STANDING SPINACH.

than any other, that this excellent vegetable is not found in every private garden.

The Long Standing Spinach, a variety of recent introduction, is a decided improvement in this direction. In general appearance and quality it resembles the Round Leaved variety, but its great merit consists in not running to seed as rapidly as this, or, in fact, any other kind. In a trial on our grounds it was fully three weeks later in forming seed stalks than the Savoy Leaved growing along side of it.

ORNAMENTAL-LEAVED BEETS.

Beets as ornamental foliage plants are among the later years' novelties, and, in reality, few out-door plants surpass the rich, deep crimson color of even some of our common garden Beets.

One of the best ornamental kinds is the Victoria Beet, or *Beta hortensis metallica*, represented in our illustration. It is of very robust growth, and of a rich, deep metallic crim-

THE VICTORIA BEET.

son hue. Its cultivation is the same as that of ordinary Beets, but when required especially for ornamental purposes, it is recommended to start it in frames, and transplant to its permanent location, so as to produce immediate effects. As division rows between the different parts of the garden, or planted against hedges their effect is unique and attractive in any garden. We have had good success with it as hedges.

A GARDEN MARKER.

A very convenient marker for the garden can be made readily of a piece of plank three feet five inches long, and about six inches wide by one thick. On one side I put four runners 12 inches apart; these should be at least two inches wide, six inches long, and one and a half inches thick, rounded at the front corner like sled runners, and wedge-shaped on the bottom. On the other side I placed the runners 18 inches apart, which is about the best distance for most garden crops. A good broom-handle will make a tongue to pull it by. With this three or four drills can be made at once, and one stretching of the line will answer for all.

Planting everything in the garden in drills is much the best plan, or even when a seeder is used, the marker is of sufficient aid to pay for the trouble of using. I simply nailed mine together and was not over a half an hour making it, while it will save that much time in a day's gardening.

I use a hand-seeder in sowing the greater proportion of garden crops, and by marking off the drills with a marker, I find I can do better work than by attempting to follow a line each time; and having the rows straight aids considerably in using the garden plows and cultivators, as they can thereby be run very close to the rows of plants, saving considerable work in weeding and hoeing. In any tolerably good garden soil a marker of this kind will make the drills plenty deep enough for sowing nearly all kinds of garden crops.

N. J. SHEPHERD.

BEST AGE OF SEED PEAS.

It is well-known that sound Peas, if kept in a dry place, will retain their vitality for five or six years, but recent experiments made by Maj. H. E. Alvord, at Houghton Farm, showed even more than this. They gave the interesting result that seed Peas two and three years old produced larger crops than those of the previous season. With Melons, Cucumbers, and other cucurbitaceous plants, it is generally accepted that seed a few years old is more productive than new seed, but with Peas the contrary has been supposed to be the case. The care and accuracy with which these experiments have been made, entitle them to special consideration, and it is to be hoped that this series of experiments will be continued long enough to unmistakably establish the facts in question. Major

Alvord's article on this subject in THE AMERICAN GARDEN for May merits careful study.

FRESH SPROUTS.

Covering growing Onions lightly with soil is said to diminish their pungency, while it decreases the yield but little.

Taking all considerations together, no labor on the farm pays so well as that bestowed upon the family garden.

The Fruit Garden.

SEASONABLE HINTS.

If anyone doubts the beneficial influences of fruit growing, let him go now into sections where Strawberries are raised extensively, and he will learn that in almost every instance, fruit growing, from a small beginning, has spread and increased until not a home is to be found without its fruit garden. With the greater abundance of fruit, more and more is used at home, resulting in the better health, comfort and happiness of the consumers. Compare with this a rural home destitute of luscious fruits, fresh vegetables, and bright, sweet flowers; and the wide difference becomes apparent to even the most superficial observer. Refinement, intelligence, and morality are the natural concomitants of fruit culture and general horticultural development.

Raising Seedling Fruits is most fascinating employment, productive of a great deal of pleasure, and, sometimes, profit too.

Seedling Strawberries are easily raised. The most perfect berries should be selected for the purpose. They may be dried in the sun, and gently rubbed so as to separate all the seeds; or, when larger quantities are to be prepared, they may be washed out and strained. When dry, the seeds may be kept till the following spring, or till wanted. But a more satisfactory way is to mash the berries with enough fine, dry sand to make a dry mixture, and sow at once.

The soil should be light and friable, and the seeds covered not more than one-sixteenth to one-eighth of an inch. They may be sown in the open ground in some partly shaded situation where the young plants are to remain till the following spring, when they are to be transplanted in beds, like ordinary layer plants.

Professional growers prefer to sow the seed in boxes or pots, as in this way better care can be given to the young plants. Grown thus they generally become large enough for transplanting in early autumn. In either case the plants require careful protection during winter.

Other small fruit seedlings may be raised in the same manner, but the seeds, even when sown as soon as ripe,—which is the best time,—will not germinate before the following spring.

Transplanting Raspberries.—This year's sprouts may be transplanted now, by taking advantage of a damp, cloudy day. When the young shoots are about six inches high they are in the most favorable condition for taking them up. This should be done with a sharp spade, so as to preserve a good-sized lump of soil attached to the roots, with which they are to be transferred to their new position. With ordinary care all will live, and produce a crop of berries the following year.

Hardiness of Currants.—A friend living on Long Island told us the other day that all his Currants were winter-killed. This was a surprise, as it is the first time that we have known Currants to be injured by frost in this vicinity. We had always considered them as frost-proof as fence-posts; like the latter we have seen them thrown out of the ground by frost, but never killed outright.

FRUIT PACKAGES.

Suitable size, attractive form, and low cost of packages for marketing fruits, are considerations of more importance to the fruit grower than is generally supposed. In regard to the question whether a gift package is not preferable to a more costly one which has to be returned, there is considerable difference of opinion.

A few claim that the best, regardless of cost, is the cheapest, while the majority of growers prefer the cheaper packages, in consequence of which, competition among manufacturers of these packages has become so great, that the cost is nominal compared with former prices. When first made, the cost of a thirty-two quart berry crate was \$2.50, while now one can be bought as low as 75 cts. each.

The original quart berry box invented in 1850 by Morris Cohen, of Washington Market, New York, for the shipping of wild Blackberries, was square with upright sides and cost about 6 cts. each. The introduction of the Beecher patterns was a great improvement on the former ones and cost one-half as much, but even then the cost was a great objection to many buyers, consequently when the American square basket with a substantial decrease in price was introduced, it became very popular, and this style of basket with the Delaware crate is now the leading berry package in the New York market.

For many years these packages were used exclusively for berries, and it is only lately that they are utilized for other fruits. Now these baskets are filled with large, fancy Currants, which meet with ready sale, as they require no handling by the retail dealers and are sold as received. Other growers take the small baskets out of the crates and replace them with larger ones, in which they pack Grapes, Cherries, Currants, etc., etc.

The original forty-pound Grape box was considered a model box, but as time passed, others were introduced, and in turn passed away. The ten and five-pound boxes, introduced by the Fairchilds, were packed in skeleton cases, and for a limited time were all that was desired, but soon the craving for smaller packages broke out, and they were discarded for the three-pound box. This met with an immense demand for years, when it became superseded by the five and ten-pound covered baskets, which are now the leading Grape packages in our market.

Among the recent introductions, is one known in Ulster County, N. Y., as the "Gift Grape Crate." It has a skeleton case containing six shallow baskets, with a platform to support the upper tier. For shipment to more distant cities than New York, where the packages cannot be returned, they are convenient enough, but I do not believe it profitable to ship them to our city.

These packages are well adapted for shipping Currants and Cherries in.

The old splint Peach baskets, once so common, have been superseded by the "Slave" baskets, now generally used on account of their cheapness. They can be bought for 6 cents each, and their low cost has developed a desire among growers, as well as dealers, to do away with the custom of returning them to the shippers. There is so great a demand for Peaches from distant markets,

that many shippers refuse to purchase them unless the baskets are sold with the fruit. Our local Pear growers are now shipping the bulk of their fruit in bushel boxes, of which there are two styles. One has a hinge lid with hook and eye at each end, while the top of the other is nailed on, but the bottoms of each are alike, having a narrow strip of about three inches in width, nailed on each side, with a center piece between. The whole is fastened with screws to enable the packer to fill the box quickly, neatly and compactly.

C. W. IDELL.

FLORIDA STRAWBERRIES.

When Florida Strawberries are offered in our Broadway fruit stores at two and three dollars per quart, and there are people able and willing to buy them at these prices, northern fruit growers who would consider ten cents a quart a good average price for their crops, will naturally look with longing eyes towards the land where such a golden harvest seems to await them. Yet, as "all that glitters is not gold," so Strawberry culture in Florida has its disappointments, and the following communication from E. Williams, who is an experienced fruit grower and remarkably keen observer, to the Philadelphia Press, throws more light on this subject than anything we have read before.

Early in February, on my way here, writes Mr. Williams from Indian River, Fla., I spent a few days with a friend near Ocala, in Marion County. He was very proud of his Strawberry plants, and entertained "great expectations" as to their future growth, multiplication and fruitfulness; but with few exceptions, his plants did not present to me any rosy prospect of an immediate crop. Most of the plants had but feeble vitality. They were set last fall and during a severe drought, and had had a hard time, but this summer he expected them to grow so he could enlarge his plantation.

Disappointed at my failure to discern a hopeful outlook, he took me to see a successful grower who had ten acres in fruiting this season. The farm of 800 acres—an old sugar plantation—is agreeably rolling for this country. From the buildings, on an elevated plateau, more of Florida can be seen at one glance than from any viewpoint I had yet attained. From this the ground slopes to the East, South and West, to a broad valley of heavier and moister soil, the drainage grounds of the more elevated portions of the farm. It is on these low bottom lands where the Strawberries are located.

We first saw about an acre planted in frames, so arranged that they could be covered with muslin in severe weather or cool nights, to protect them from untimely frosts. These plants looked well, were blooming and setting quite freely and gave better indications of success than anything I had yet seen. We sought the proprietor on a distant portion of the farm, where he was engaged with a dozen hands in picking. The baskets were just being packed in refrigerator cases for shipment. The berries were fair in size, but, as I told the proprietor, they were hardly ripe enough. There were too many pale cheeks and white noses, to which he replied they carried better if picked close, and they would all color up by the time they reached the New York market.

"What do you expect to get for them?" I asked. By latest advices they were selling at \$2.50 per quart; these will probably bring \$2. Transportation to New York costs ten cents per quart, and when they sold as low as twenty-five cents, he did not propose to send any more, but dispose of them nearer home. The variety grown chiefly is the Nonnum, as it seems to do better than any others which were being tried in a small way. He hoped, if they did well, to pick 20,000 quarts.

I should be glad to know that these expectations were realized. If so, and they were to net twenty-five cents per quart, it would amount to a snug little sum. Public statements of this kind generally look alluring, while the cost of the crop is often overlooked or left to the imagination. The cost of picking here is many times greater than any northern experience would lead one to consider necessary, for, instead of filling a basket at three or four sittings here, the picker had to wander over as many or more square rods to get the same quantity of ripe berries.

It is difficult for us northern berry growers to realize the changed conditions brought about by this climate. During the Strawberry season here, the temperature is moderately low and uniformly continuous, seldom reaching 80° or 90° from the flowering of the plants till the close of the season. If this condition of things existed with us our berry season would be much prolonged, but with our more rapidly increasing temperature, our berries are hurried into maturity, and there is crowded into three or four weeks what is accomplished here in two or three months.

To follow this shipment I took the address of the consignee in New York and wrote a friend there to look after them and report, which he did as follows: "The berries arrived in good condition, sound but rather green, and sold at 80 cents."

This rather diminishes the "great expectations" of prospective profits from the start. In further pursuit of information on this matter, I find that the failures are attributed to drouths and long summer—the plants burn up—and my conclusions are, that Strawberries will not grow everywhere, but by proper and judicious selection of location, in soil possessing sufficient moisture, tolerable success may be obtained. Nevertheless, the question of profit in its commercial aspect is an open one in the most favorable localities.

Grape-seed oil is used in Italy for purposes of illumination. The extraction is principally effected at Modena. It has also long been used for similar purposes in Germany and the Levant. Thirty-three pounds of seed yield about 13 quarts of oil (or about 18 per cent). The seeds of white Grapes yield less oil than those of the dark variety, and young vines are said to be more fruitful in this respect than older ones. As to the French varieties, the Rossillar, Aube, and Herault seeds yield 2 per cent more than Bordeaux seeds. The color is a golden-yellow, and the oil loses about 25 per cent in purification.—*Corps Gras Industriel.*

THE OHIO BLACKCAP.

With the increasing consumption of evaporated fruits of all kinds, there is springing up a large demand for varieties especially adapted for this purpose. The drying of Black Raspberries forms already an industry of considerable dimensions, and of all the many varieties in cultivation, none seem to combine so many desirable qualities for drying as the Ohio. It is of good size, firm, and enormously productive.

John H. Teats, of Wayne Co., N. Y., whose extensive experience in growing and evaporating fruit gives special value to his conclusions, says: "The Ohio with me surpasses in every respect any Black Raspberry I have ever grown. It has proved itself hardy, productive, and a strong and upright grower. The fruit is of good size and very firm; consequently ships well. It is of most excellent flavor. Of it I can raise at least one-fourth more quarts per acre than of any other variety. I had last year one acre on

THE OHIO BLACKCAP.

rather poor soil that yielded over 4,000 quarts." A yield that pays very well indeed.

It requires from two and a half to three quarts of fresh berries to make a pound of dried fruit; and as the average selling price of evaporated Blackcaps is 30 cents per pound, the returns from such a plantation may readily be calculated.

The Strawberry crop of the Southwestern States is said to be a month later than usual.

What is not known about our native Grapes, Mr. T. V. Munson of Texas thinks, would fill a bigger volume than any yet published relating to what is known about them.

In preparing to plant Strawberries, take good land if you can get it; if not, take poor, and enrich it if you can. If you are planting for home use, be sure to plant on some kind of land; if you cannot get good, take poor, says Parker Earle, president of the American Horticultural Society.

SHORT CUTTINGS.

The importation of fruit at the port of New York is nearly \$5,000,000 annually.

For all crops requiring an abundance of nitrogen, nitrate of soda is one of the best and cheapest fertilizers.

It is estimated that between fifteen and twenty million dollars' worth of seeds are sold annually in the United States.

The Worden is the Queen Grape of the Mississippi Valley, says Prof. Budd. It has gained a topmost place in the estimation of growers, solely by its own quiet, annual exhibit.

The duration of vitality in seeds depends very much on the manner in which they are kept. Trustworthy authority states a case in which Melons were raised from seed forty years old.

The difference in hardiness in Strawberries, says E. B. Underhill, depends more upon the position of their blossoms than anything else. If the blossoms look up they will be killed at 32°, if they look down they will endure 28° or less, according to shortness of stems and overlapping foliage.

Professor Maynard is of the opinion that with the use of chemical fertilizers, and the brush, grass and other material growing upon unimproved, stony land, much of it that cannot be cultivated may be made to produce paying crops of fruit, while the land that can be cultivated should be used for other purposes.

W. H. Hills of N. H. had a Benoni Apple-tree in soil so poor that it made neither wood nor fruit, to which he applied a peck of ashes in midsummer, and the next year it was overburdened with fruit, and made a foot of growth. This answers the question whether a soil needs potash or not, surer than anything else can.

A farmer in southern Connecticut, allured by the tree-peddler's picture-book, a few years ago planted a large orchard of Russian Apples. Now he wishes he had planted Baldwins instead, and that the peddlers had never crossed the State line. He should have consulted State Pomologist Augur, to whose article in our April number he is respectfully referred.

Marshall P. Wilder, to whom belongs the credit of having first instituted a practical improvement in pomological nomenclature, proposes now to extend this movement to vegetables and flowers. We heartily second this undertaking, and sincerely wish that the venerable horticulturist's life may be spared long enough to carry it out, and thus build himself a living, immortal monument.

A Massachusetts correspondent is greatly pleased with the Willow Twig Apples this spring. They came through the winter in prime condition, with very little rotting, firm and of fine flavor and texture. A. R. Whitney of Illinois places it as only second in the list of profitable Apples with him.

The Flower Garden.

JUNE.

Come back, O June, to my heart!
I long for thy pure white Rose,
And the fresh green shelter apart,
Where the daintiest Fern-tip grows.

Come back with thy Poppies and Maize,
Let me lie in thy arms and dream;
In the languid delight of thy days,
In the smile of thy sunshine's gleam!

Come back, O June of my life!
Bring with thee the one dear face;
And my song shall leap forth with gladness rife,
Made richer by love's sweet grace.

Come back, O June of my love!
With the fragrance of Eldor and vine—
My love that was pure like a dove,
And whose kisses were sweeter than wine!

Ah! never again that rich perfume
On my earthly sense shall rise,
Till I gather the Roses' crown of bloom
On the hills of paradise.

—Continued.

SEASONABLE HINTS.

We have frequently spoken of the impossibility of giving directions which shall be seasonable for all sections at the same time, and the following from an esteemed friend of THE AMERICAN GARDEN in Washington Territory, under the date of April 4th, well illustrates the fact:

"While the people in the Eastern States, and those who live many degrees of latitude south of us, during the month of March were suffering from heavy snow storms and severe cold, here on Puget Sound in the north western part of the United States we had as beautiful spring weather as one could wish for. Daisies, Pansies, Daffodils, Wallflowers, Tulips, Hyacinths, Gladiolus, etc., have been in bloom for some time. Shrubs of various kinds are donning their summer coat of green, while the grass has been growing since February, and active gardening has been in progress since the first of March and before."

June and Roses are not always insolubly combined, for no one need expect success with Roses without keeping constant watch for insects, and being promptly on hand to war against them at their first appearance.

The Green Fly, or *Aphis*, is a very common insect infesting Roses, but one which, fortunately, can be easily exterminated with Pyrethrum, "Buhach," or White Hellebore powder dusted over every part of the bushes when wet. Tobacco tea, made by boiling a quarter of a pound of Tobacco stems or common smoking Tobacco in a gallon of water for about ten minutes, and when cooled and strained, sprinkled or syringed over all the affected leaves and shoots, is also an excellent remedy. "Buhach" is very easy to use.

Rose Caterpillars may be kept in check with the same remedies, but nothing is nearly so effective as crushing them within the leaves which they glue together for shelter.

The Rose Bug is proof against most insecticides, and unless it appears in armies, which it does sometimes, hand picking is about the best safeguard. "Sling Shot" has been used by some of our readers with good results.

Red Spiders are more destructive in greenhouses than out of doors. Daily syringing with whale-oil soap is usually sufficient to destroy the pest.

THE ZEBRA GRASS.

Eulalia Japonica zebрина.

This is a very distinct and attractive hardy perennial, reed-like plant of robust growth, forming when well-established large clumps from five to seven feet in height. Its long, narrow, green leaves present alternate bands of green and creamy white of varying width, thus producing a most singular and attractive appearance.

The flowers, which are produced about the middle of September, are borne in panicles rising from the center of the stalk. At first these are of a brownish color with erect branches, and not at all showy, but as the flowers expand, the branches of the panicles turn over gracefully towards one side, thus bearing a strong resemblance to ostrich plumes. This plant resembles *Eulalia Japonica variegata* in form, habit, and manner of growth, but differs in being of more robust growth, and most essentially in the manner of its variegation, which runs crosswise instead of longitudinally, unlike other variegated plants. This feature gives it a very unique appearance, so that it cannot fail to attract the attention of the most care-

THE ZEBRA GRASS.

less observer, and always excites curiosity.

If the plumes are gathered when at their best, and are carefully dried, they will make desirable parlor ornaments. They last for many years, and when placed in a dry room, expand fully and present a most graceful appearance.

This plant is easily cultivated, and when well grown is specially valuable for sub-tropical work, although it is equally at home in the mixed flower border, or in groups, or as single specimens upon the lawn. It succeeds best in a well-enriched, loamy soil, and if at all possible, should be given copious waterings during seasons of drought. After the plant has become well-established it should receive a good dressing of well-decayed stable manure, dug in around it, in the spring, when the leaves should be cut back to the ground.

Propagation is effected by careful division of the roots in the spring, just before the plant starts into growth; but it is well to bear in mind that the plants make but little growth the first season. Frequent removals or divisions of the roots should therefore be avoided as much as possible.

This *Eulalia* is a native of Japan, where it was discovered by Thomas Hogg and by him introduced into cultivation. It was first offered for sale in the spring of 1877. As yet it has been little disseminated, but its merits are gradually becoming known, and I believe that ere long it is destined to form objects of graceful beauty, in the door-yard of the laboring man as well as in the most elaborate lawns and flower borders.

CHAS. E. PARNELL.

HOT-BED SASHES IN SUMMER.

As the warm weather approaches don't lay aside your hot-bed sashes as of no further use. Those who suppose that frames and sashes are only of use to protect plants from cold, have not yet fully learned the value of glass.

SUMMER TREATMENT OF VIOLETS.

Years ago I followed the then usual practice of dividing and planting my Violets in the open ground in April, to grow for planting in the frames in September and produce bloom in winter. In a favorable season the practice was reasonably successful, but usually the hot sun and the red spider made havoc among the stools.

About ten years ago I began the practice of cutting my Violets up into small pieces, with a bit of root, and potting them in three-inch pots. These pots were placed close together on a bed of coal ashes in a cold frame. A good coat of whitewash was applied to the sashes and they were placed over the plants, resting on strips laid lengthwise the frame at top and bottom, so as to leave an air space of an inch or two all around. A very moderate amount of attention with watering-can and syringe will keep the Violets green and flourishing all summer, and these potted plants, when planted in the frames in autumn, give the earliest and largest flowers. My florist friends used to laugh at me for keeping Violets in pots all summer, but one or two hot and dry seasons convinced them of the value of the practice, and now it is almost the general rule here in Maryland.

GLOXINIAS, ACHIMENES, BEGONIAS.

Another use which the amateur without a greenhouse can make of frames, is in growing Gloxinias and Achimenes under the shaded glass, in pots just as recommended for Violets. Gloxinias may be had in much better condition for the fall exhibitions by starting and growing them in frames, than they usually are in greenhouses.

Tuberous-rooted Begonias and many other plants do well in frames under shaded glass.

W. F. MASSEY.

PLANT SWEET FLOWERS.

A garden without a large quantity of fragrant flowers—such as Sweet Peas, Mignonette, Sweet Alyssum, Stock Gillies, Clove Pinks, Rose Geraniums—is not judiciously planted. These are the most desirable flowers for vases, bouquets, and many other uses that can be obtained.

The more brilliant bedding-out plants have been selected of late years for the adornment of the garden, such as Geraniums, Hibiscus, Fuchsias, Hollyhock, Chrysanthemums, Salvia, Verbenas, Asters, Balsams, etc., to the exclusion of the old-fashioned sweeter flowers of our grandmothers' gardens, but the exchange has not been a de-

strable one. Therefore, let me beg of the readers of THE AMERICAN GARDEN, to purchase Sweet Peas, Mignonette, etc., by the informal garden or lawn, why, plant them in the vegetable garden, where they will bloom in odorous beauty, and feed all the bees in the neighborhood, while they will supply you with handfuls of sweets to wear at your belt, or buttonhole, with bowlsful of flowers to decorate the breakfast table, all wet with the morning's dew, and with lovely vases to adorn your parlors, and basketfuls to send to your friends.

Oh, plant flowers, sweet flowers! and rejoice in their beauty and their fragrance, and let them fulfil their mission by uplifting your heart to the Giver of all good.

DAISY EYEBRIGHT.

A BEAUTIFUL VERBENA.

Nearly all our garden Verbenas, *Verbena hybrida*, were derived from the species *Melindres* and *teucrioides*, and so fixed has become their habit and character, that among the millions of seedlings raised every year there is but little difference except in the color of their flowers. Our illustration represents the new seedling "America," raised by Peter Henderson, which marks a decidedly new type, and promises to become the forerunner of an entirely new class of these charming bedding plants.

Among the thousands of seedling Verbenas that we have raised in the past twenty years, says Mr. Henderson, we have never produced one that equals this. The individual florets are larger than any variety of its color, being one inch in diameter. The trusses are three and a half inches across and of perfect form. The color is a striking shade of crimson scarlet with an immense white eye. An engraving, however good, can give but an indifferent idea of its grand appearance.

AMARANTHUS.

Years ago we used to see a rather coarse-growing plant in most country gardens, bearing long, drooping, tassel-like racemes of small flowers of a dark, blood-red color. This plant was called "Prince's Feather." It did not attract much attention then, for few tried to produce "startling" effect in the flower-garden. But of late, since large masses of color have been "the fashion," rather than individual beauty, this plant has received more attention, and is being quite extensively used. For this purpose it is extremely valuable. The foliage is, in almost all varieties, quite as striking as the flowers, being of a dark, rich crimson or maroon.

To insure the best results, the soil should not be made very rich. In a moderately good soil the plants are more compact and of a better color. For large beds, or a hedge, this plant is very effective. It should, however, on account of its rather coarse habit, be kept in the background, where only its general effect can be seen.

A. salicifolius grows to the height of three feet. It has long, narrow foliage, of dull green tipped with maroon. As it assumes

a pyramidal form, and the leaves droop gracefully, it is a good plant for the center of a bed.

Sunrise is probably the most brilliant variety of all, as to foliage, the leaves on the extremity of the branches being a shining crimson, reminding one, at a little distance, quite forcibly of the *Poinsettia*.

Tricolor has red, yellow, and green foliage. In this variety, the foliage is of greater width than in any other I have ever grown, and the effect is therefore more solid and massive than it is where the narrow-leaved kinds are used. The flowers are not produced until quite late in the season.

Last season I used the *Amaranthus* as the principal plant in a hedge, with *Nasturtium* in the front row. The contrast between the dark foliage of the former and the rich green of the latter, with its bright flowers, produced a fine effect. For beds near the house, *A. salicifolius* is to be preferred, as it has less of the coarseness peculiar to this class of plants than any

other variety. For broad effects of color, *Sunrise* is the best of all the varieties of this showy class of plants.

E. E. R.

STERNBERGIA LUTEA.

One of the prettiest of fall-blooming flowers, and one of the most uncommon, is the Golden Crocus-like *Amaryllis*, *Sternbergia (Amaryllis) lutea*. It is a good companion flower to the *Colchicum* and makes a pleasing variety in color. The bulbs should be planted late in spring or in early summer. They remain dormant so far as visible growth is concerned until early autumn, when the handsome, dark-green foliage appears, followed quickly by a profusion of golden flowers. The foliage retains its beauty all through the winter and gradually ripens off as the warm weather comes in spring, and the plant goes into its summer rest. The bulbs may be allowed to remain from year to year in the same place by covering them during the winter, and will make large clumps. A good location for them is be-

AMPELOPSIS VEITCHII.

This is of late years becoming a common and popular plant for covering walls, and its beauty is unquestionable. Few people, however, know how much more rapidly and effectively it can be grown from seed than from cuttings. A seedling plant will get nearly as far over a wall in one year as a cutting will in two. If you have a wall you wish to cover with *Ampelopsis*, get these seeds in autumn if you can, but spring will do, and sow them in a nicely prepared border along the wall where you wish them to climb. The seeds germinate readily and the young plants take to the wall at once, and soon get complete possession of it.

PLANTING GLADIOLUS.

Don't plant them all at once. Plant a few about the first of June, more about the middle, and some in the last week of this or first of next month, and, in this way, weather permitting, you will have flowers till the end of October. Plant in rows and very thickly, say two to three inches apart in the row. *Brenchleyensis* is one of the cheapest, brightest and most useful varieties of a beautiful genus.

OUR FLOWER BASKET.

The annual *Chrysanthemums* are worthy of a trial in every garden. For a corsage bunch nothing is more appropriate.

Five cents' worth of *Phlox Drummondii* seed will, if given decent treatment, produce a wealth of brilliantly-colored flowers all through the summer.

For a shady spot, under trees and shrubs where the soil is rich and not too dry, there is nothing more satisfactory than *Lily of the Valley*. To plant it once is to have it forever in the garden.

In the latitude of New York it is not safe to turn out tender bedding-plants before the last week of May, or better still, the first of June. Last year frost killed many *Coleus* on the 30th of May.

The Dwarf Flowering Almond is one of the prettiest little shrubs in cultivation, and deserves a place in every garden. As it flowers on the young shoots it should be cut back severely after flowering.

For the protection of single plants against slugs there is nothing safer than to sprinkle a ring of salt around them. A slug can no more cross it than a man could swim through an ocean of fire.

Our hot, dry summers are not as congenial to the English Daisy as the damp atmosphere of Europe, but it may be grown successfully in frames during winter, and early in spring transplanted to an open border as a most appropriate companion to Pansies.

VERBENA AMERICA.

The Window Garden AND GREENHOUSE.

THE WINDOW GARDEN FOR JUNE.

House-cleaning is in order or finished, the windows are emptied of their plants, and what pot-plants we now have are plunged out-of-doors, or set on a stand on the piazza or in some other suitable slightly shady nook. Plants now are far better off when outside than inside. But be careful and see to it that they are properly arranged so far as their taste for shade or sunshine is concerned.

WATERING PLANTS.

In dry weather plants want water. If they are in pots they must get it whenever they need it, and that, too, in unstinted measure. In bright sunshine do not water them overhead, but in the evening or late in the afternoon a sprinkling overhead is good for them. The afternoon or evening is the preferable time for a general watering. Plants that are set out in the garden, also flower-garden stock, should not be watered daily, even in very dry weather.

Before they begin to suffer for want of water, give them a thorough soaking, and the next morning rake or otherwise unfasten the surface of the soil to prevent undue evaporation and the surface from baking. Don't deal in dribblings but see to it that the watering you give is enough to soak through to the deepest root. One such watering is enough to last for several days. Frequent waterings are injurious to out-door plants.

MULCHING AND CULTIVATING.

By keeping our beds and borders clean, and thoroughly and frequently cultivated during the summer months, we much reduce the need of watering, and this is easily done by means of draw or scuffle hoes, long-tined iron rakes, or where the plants are set closely, by the little five-tined "Excelsior" hand-weeders.

Mulching, too, is of very great benefit. In the case of flower-beds, tidy borders containing small plants, or plats filled with Violets, Carnations, Bouvardias, and other winter-stock, short stable-manure is about the best thing to use. Half-rotted tree-leaves are hard to get, besides, they rot quickly; lawn-mowings, if dried before applied, are chaffy and apt to be blown about, and if used green will become a thick, close mat. But almost anything is better than nothing.

For trees, shrubs, and strong-growing plants generally, leaves sprinkled over with thatch to keep them in place, salt hay, lawn-mowings, or any handy literary material is serviceable.

INSECTS.

Thrips are very destructive to Camellias, Azaleas, Amaryllises, Crinum and bulbous plants generally; the "twitter" to Carnations, burying itself in the growing points; the red spider delights in the warm, dry weather, and spreads alarmingly over trees and herbs and hardy and tender plants; the mealy bug prefers the greenhouse or window to the open air, and in summer chooses the roots and lower portions of the plants, rather than the flower-buds and growing points; scales abound on the old wood, and the young aphides may multiply exceedingly, especially in late summer and fall; and we have

an army of caterpillar pests, bugs and beetles, and all want attending to.

PYRETHRUM POWDER

In the form of Persian, Dalmatian or Buhach, if fresh and pure, puffed into the faces of the aphides, will make them quit their hold and drop dead or intoxicated to the ground. Mixed with water, and in this way sprayed on caterpillars, Rose-bugs and some other insects, some experimentors claim that it will kill the pests, but my experiments have been much less successful.

TOBACCO-WATER

As dark-colored as very strong tea, is destructive to aphides, thrips and "twitter," but harmless to scales, red spiders and mealy bugs. Tobacco stems, commonly known as "factory trash," may be obtained at a cent a pound at any cigar manufactory. Half fill a pail with stems and fill up over them with boiling water. A pint or quart of this liquid in a can of water will be about right. Tobacco stems spread under the plants, either out-of-doors or in the house, are effectual in keeping off thrips and aphides.

KEROSENE EMULSION.

So far as my experience extends, is one of the best insecticides: it will kill anything that has a soft skin. I first make it in the form of butter, but if the workman is lazy, I only get a very thick paste.

My recipe is simple enough: Take a measure—say two quarts—of skimmed milk, put it into a vessel on the fire, add a piece of soap—about a quarter of a pound or more—pared into thin slices so that it may dissolve quickly, and stir till the soap is dissolved and the milk gets pretty warm, then pour into a pail and add an equal quantity of kerosene, and now with a coarse syringe work the mixture as vigorously as possible till you get butter, or it becomes so thick that it won't pass through the syringe, which usually happens in 15 to 20 minutes.

In using I dissolve some of this butter in a can of water and apply with a syringe. As a preventive, a pint of butter in an eight-quart can of water: as a cure,—for the hard-wooded plants as Camellias, Crotons, Allamandas, one-fifth of kerosene; for hard and leathery leaves as of Ficus, Carnations, and Dracenas, one-eighth; for young leaves and growths, about one-tenth.

But cultivators should experiment and determine for themselves. In the case of small plants in pots, or others that are planted out, and where I would be likely to waste considerable of the emulsion were I to apply it with a syringe, I wet the plants with a big sponge.

CHRYSASTEMEMS.

Grow them planted out rather than in pots. Keep them well pinched in till the end of June, when, after that time, it may be well to let them grow. If plants are scarce, "strike" the points you pinch off; they will bloom nicely in the fall no matter how small they are. Put one stout stake to each plant and tie the leading stems to it, but leave the laterals untied. Water copiously.

POLYANTHUSES

And other hardy Primroses in frames will be out of bloom now and the better for a little shade. If now in a sunny place, lift and plant them thickly in rows on the north side of a close fence, hedge, or building, there to remain over summer. But do not under any circumstances divide them now; let that operation alone till the plants start again to

grow in fall, then lift, divide, and replant them in frames for blooming next spring.

If you have not any Polyanthuses, sow some seeds now, and grow the young plants in a cool, half-shady place, and enjoy a treat next April and May. WM. FALCONER.

PLANTS FOR SHADY WINDOWS.

Having a north window from which the outlook was not very pleasant, I determined to fill it with plants. For this purpose I selected such kinds as I thought most likely to do well in almost complete shade. These were *Aspidistra variegata*, *Cureuligo recurvata*, *Dracena indivisa* and *Seafortia elegans*, of the Palm family, with an English Ivy to clamber up and about the window frame. I purposely omitted all flowering plants. My selection has been very satisfactory during the winter. The plants have grown well, and though there was no bright color to relieve the green of the foliage, the effect was cheerful and suggestive of summer.

ASPIDISTRA VARIEGATA.

The *Aspidistra* has leaves like the Lily of the Valley in shape, only a great deal larger. They are striped with light and dark green, and occasionally with clear white. Each leaf is thrown up from the roots. The leaves are very thick and firm in texture, and seem to be everlasting. They are very easily kept clean by the use of a cloth or sponge. There is little danger of doing any damage to them by handling them. This is my second experience with this plant in shade, and I am convinced that it is one of the best ones we have for north windows, or any other location deprived of sunshine. On account of the thick texture of the leaves it is able to withstand the dry air and dust of our living-rooms better than almost any other plant I am acquainted with.

CUREULIGO RECURVATA.

This plant has long leaves, deeply ribbed or plaited their whole length, with a pure white stripe in the center. These leaves have a graceful curve, and as they are quite freely produced, a well-grown plant is very ornamental. Like the *Aspidistra*, it is firm in texture and little affected by heat or dust.

A GOOD PALM.

The *Seafortia* made a fine center for the group, its long, much-divided leaves curving outward gracefully over the others. This is one of the best Palms for house culture. It is not only more attractive in its habit of growth than *Latania Borbonica*, which is more frequently seen, but it is more effective when young, because of the length of its leaves with their fine curve. It is entirely devoid of the stiff appearance peculiar to the other variety.

A GREENERY.

A good show of greenery is much more satisfactory than a window full of sickly plants, from which we vainly try to coax flowers under circumstances which are unfavorable to such results. I would confine my selection of plants for shady windows entirely to such kinds as have good foliage for whose development sunshine is not at all necessary. If this is done, and no flowers are expected, there will be no disappointment.

Lycopodium planted in each pot grew vigorously, and in a short time the soil was covered with its pretty green. A frequent sprinkling kept it fresh and healthy.

E. E. BENFORD.

BOUGAINVILLEAS.

Bougainvillea glabra and *spectabilis*, the best known representatives of this interesting genus of tropical shrubs, are at present extensively used for parlor decorations. They are remarkable for their beautiful, brilliant, rose-colored bracts, and few plants at our floral exhibitions attract more admiring attention. The following directions, from the London Garden, are given in answer to some inquiries about their culture.

The Bougainvillea is one of the best plants we have for decorative purposes, for, if well managed in the first stages of its growth, it will flower freely in a small state. Young plants of it are easily obtained in spring when the old plants are pruned back, after being rested during winter. Procure then as many cuttings as may be required for one season; take them off with a heel of firm wood attached to them, as cuttings of that kind root quicker and are more to be relied upon, than when taken off the points of very long shoots.

The soil used for the cutting pots, should consist of sifted peat, leaf mould a third, and a small portion of loam, adding about one-half of the whole bulk of sharp, silver sand. Mix well together, fill the pots and place a thin layer of sand upon the top of the soil, firming it well. Dibble the cuttings round the sides, and place the pots in a propagating pit, or hot-bed, in which there is a steady bottom heat, and a top temperature ranging from 60° to 70°. Under such conditions the cuttings will root in a few days. The young plants should then be potted off singly into three-inch pots, using the same compost as before, but not so much sand. After potting, replace the plants in the same temperature as before, until they get established in the fresh soil, when they may be removed into a temperature of about 50°. Thus treated the wood will be firm, short-jointed, and probably healthy. When the shoots have made four leaves, pinch their tops; they will then form good

specimens. Shift once more during the summer when thoroughly well-rooted. Six-inch pots will be sufficiently large for the first season, and if well treated, a few sprays of bloom will be produced during autumn.

Attend well to the watering, and endeavor to promote growth until the end of September or beginning of October, when water should be gradually withheld until all the leaves fall off. After that, just give sufficient to keep the wood of the plants from shrivelling. Keep them in this state until February or early March, when they

portion of sharp sand to keep the whole open. By this treatment good specimens may be had the third year.

THE BENNETT ROSE.

No other Rose has ever made so much of a sensation as the William Francis Bennett. It was raised by the celebrated English Rose-grower, Henry Bennett, from Adam, or President, crossed with Xavier Olibo. It will be recollected that a part of the stock was bought by Charles E. Evans, of Philadelphia, for seven hundred and fifty pounds sterling, under the restriction that no plants should be sold before 1887. Mr. Evans has since secured the balance of the stock from Mr. Bennett. The restriction has now been removed, however, and plants are offered for sale in several catalogues.

Its color is a beautiful, glowing crimson, a shade lighter than General Jacqueminot, nearly approaching it in intensity; in delightful fragrance it equals La France. It quickly responds to judicious pruning, and is one of the most persistent winter-bloomers in existence. Its growth is remarkably vigorous and its foliage healthy, resembling that of the hybrid remontants. We have seen this Rose frequently at our exhibitions, and the oftener we see it the more do we become convinced of its beauty and excellent qualities.

OUR WINDOW BOX.

Mr. DeWitt S. Smith, Lee, Mass., who has one of the largest collections of Orchids in the United States, has a *Dendrobium nobile*

on which 500 blossoms were counted the other day. How the bees would like that!

A little known but most beautiful annual is the *Salpiglossis*. It is only half-hardy and should therefore not be sown out doors before settled warm weather, or it may be started in the hot-bed and transplanted afterwards. The flowers are funnel-shaped, generally dark purple and delicately veined, blooming in autumn.

THE WILLIAM FRANCIS BENNETT ROSE.

should be again started into growth. When a good supply of bloom is required for several months, the plants should be started at intervals of three or four weeks.

Shift them into larger pots as soon as they commence to grow. Some prefer to give them a shift into larger pots as soon as pruned in the autumn, but spring-potting is preferable. Use good, filmy peat and yellow loam in the proportion of three of the former to two of the latter, and a fair pro-

Lawn and Landscape.

BACKGROUND FOR LAWNS.

A good background is an essential feature to a perfect lawn. No matter how tastefully the lawn proper is arranged and planted, it has a bleak, unprotected appearance, when lacking a warm background of natural color. When the vision can wander through and over the lawn, and to a wide expanse of earth and sky beyond, it gives one the impression of a tiny grass-plot or play-ground, even if it be quite extensive and varied in arrangement. If there be bright colors on the lawn, they cannot be brought out satisfactorily without an immediate background of agreeable character. A landscape is like a painting: it must have a suitable background in order to bring out clearly the beauties of color and design that are placed in the foreground.

There is nothing more appropriate for this purpose than a body of rich, dark evergreens of good, generous size. A dwarfed, scrubby tree is of no use in such a place. It is simply an aggravation to the eye, and does not in the least answer the purpose for which it was intended. What is wanted is a thick belt or grove of evergreens that will attain a growth of at least 15 or 20 feet. It is not a matter of very grave importance, if the tops are irregular, and the forms of the trees a little varied. We all like to see a lawn kept well-trimmed and regular, while a background of Nature's own handiwork cannot shock the most fastidious.

There is nothing more attractive and suggestive of repose to the pleasure-seeker than a cosy corner of the lawn, formed by a boundary grove of evergreens. While it may be so arranged as not to shut off from the house desirable views into the surrounding country, it serves at the same time to concentrate the observer's attention on the lawn, something as the hood of the stereoscope concentrates the gaze on the photograph under observation.

Those who have not given the matter close observation, can hardly imagine what a warm, bright effect, flowering shrubs produce when viewed against a background of dark green. The harmony of color and contrast is most beautiful and pleasing. It not only lends an additional charm to the lawn in summer, but preserves the grounds from that bleak, deserted aspect, which winter usually brings. In fact, a very cheering effect may be produced, even in midwinter, with the aid of such a background, by planting in the lawn such shrubs as bear bright-colored berries that remain on all the winter. With good taste and ingenuity, a pleasing design of color may be produced in this way, to soften and enliven the monotonous aspect of winter.

Such a background as I have referred to may also be considered profitable in point of utility. It serves as a windbreak for the whole premises, and especially screens the small lawn-shrubs from the trying winds. It prevents blowing and drifting of snow, that so often proves fatal to lawns by leaving the grass roots exposed to sun and frost alternately. A lawn surrounded or partially surrounded by a belt of evergreen

will start much earlier in spring, than one that has an open, bleak exposure.

In many sections of the Eastern, Middle, and Northern States, evergreens suitable for this purpose may be taken directly from the forest, and transplanted with no more expense than that of the time devoted to the work. Those who have not access to the trees in a wild state, can easily procure them from the best nurseries at moderate prices. If bought at the nursery, only the hardy varieties that have been thoroughly tested, should be selected. Where they are to be massed together in this way, the common white Pine is as suitable as any. It is a rapid grower, and very hardy. Some of the Spruce are also quite hardy, and rather more attractive than the Pine.

W. D. BOYNTON.

POETRY IN TREE-PLANTING.

"I have written many verses," said Dr. Oliver Wendell Holmes, "but the poems I have produced are the trees I planted on the hill-side which overlooked the broad meadows, scalloped and rounded at their edges by loops of the sinuous Housatonic. Nature finds rhymes for them in the recurring measures of the seasons; winter strips them of their ornaments and gives them, as it were, in prose translation, and summer re-clothes them in all the splendid phrases of their leafy language. What are these Maples and Beeches and Birches, but odes and idylls and madrigals? What are these Pines and Firs and Spruces but holy hymns, too solemn for the many-hued raiment of their gay deciduous neighbors?"

"It is enough to know that when we plant a tree we are doing what we can to make our planet a more wholesome and a happier dwelling-place for those who come after us, if not for ourselves. As you drop the seed, as you plant the sapling, your left hand hardly knows what your right hand is doing. But Nature knows, and in due time the Power that sees and works in secret will reward you openly. You have been warned against hiding your talent in a napkin; but if your talent takes the shape of a Maple-key or an acorn, and your napkin is a shred of the apron that covers 'the lap of earth,' you may hide it there unblamed, and when you render in your account you will find that your deposit has been drawing compound interest all the time."

A BIT OF NATURE.

Behind the great barn and the grape-arbor, and between the field-road and the adjacent cultivated land, there lies a tract of about 100 feet square which has not been plowed for 20 years or more. What grass grows upon it is taken off once a year in the month of July, and being near the big barn doors, the chance to cultivate is not good, from the constant going in and out at some seasons of the year.

This spot has become very attractive to the children. Here they gather the blue Eyebrights, the yellow Dandelions, the Violets, blue and white; the Buttercups and Daisies, the Red and White Clover; the wild Strawberries, the Crane's-bill and Lobelia, and innumerable other wild flowers. Ferns and mosses grow under the barn eaves, and Golden-rod and Daisies later in the season. The variety is so great and so pleasing, that

I take as much pleasure in seeing and gathering them, as do the children themselves, to whom they are a constant surprise and pleasure. They make Dandelion chains, and Daisy and Clover necklaces, Violet mats, and Burdock ornaments; gather wild Strawberries, and have a general good time in the not over-tall or rank grass, which they can wander in at will to pick the treasures which they so much prize.

The whole plot is out of sight, in one sense, but yet is very near the home, and after being mowed, is chosen as a playground for croquet, ball, hoop, and other games, as the surface is quite smooth and level. I do not know of another such a bit of undisturbed nature in the midst of cultivated grounds on all sides; and although I could easily transform it into a model lawn, or a profitable garden, still I do not regret its neglect, nor do I believe that this piece of ground could in any other way produce more genuine and pure enjoyment than it does in its natural wildness.

W. H. BULL.

THE NEW PARKS FOR NEW YORK AND BOSTON.

In "A Plea for Picturesque Gardening," Mr. Roger Riordan, in Outing for May, writes as follows concerning the new parks for New York and Boston:—

There are comparatively few disagreeable objects to be removed; and the fact that a view of the sea, in each case, enters into the scheme, adds immensely to these advantages. Nothing more is necessary, to begin with, than the opening of a few additional roads and paths, the placing of a few seats, the erection of a few shelters. Whatever else may properly be added should be a work of time,—should be thoughtfully considered, and slowly and carefully executed. Above all, no such mistake should be made as was recently committed in the laying out of the Riverside park, in New York, where, with a fool's economy, grounds were passed by that might have been added, and which, a few years ago, were more beautiful than any spot included, and the money which might buy them was spent, and is still being spent, in wholly unnecessary grading and sodding and planting, or, rather, in paying voters for pretending to do such work. Now, it is, I believe, proposed to pass by the grounds at High Bridge, the most desirable anywhere within 50 miles of New York. In another year or two they will, probably, be ruined beyond redemption by beer-gardens and groggeries; yet the only charge that they need ever be to the city would be the stationing of a couple of policemen there.

In the proposed new parks, if the artists could have their way, few changes would be made from the present disposition of the soil. It is mostly pasture-land, with small woods, plantations, streams, and ponds, and here and there some tillage. Nothing can be more generally pleasing than scenes where fields, verdant with growing vegetables or corn, or red from the plow, alternate with rocks and woodland. No trimmed and decorated landscape can be more interesting. A denizen of a great city, we may be sure, will more enjoy the sight of a field of Potatoes in blossom, than that of a hot-house full of blooming Century-plants; and the landscape-painter, too, will heartily agree with the citizens' love of nature.

Foreign Gardening.

THE MUSHROOM INDUSTRY IN THE SUBURBS OF PARIS.

The growing of Mushrooms, an industry as yet little developed in this country, assumes vast proportions in the neighborhood of the French Metropolis. Whether the Parisian epicures have an especial weakness for this most delicious of vegetables, whether their gardeners are more enterprising and skillful than those of our cities, or whether the immense abandoned stone quarries in the vicinity of Paris offer unusually favorable conditions for Mushroom growing, does not appear. The fact, however, is not to be disputed, that the environs of this great city produce more Mushrooms than those of any other city of which we have knowledge. Her subterranean caverns cannot solve the whole mystery, for large quantities are produced above ground, and in private gardens thrifty beds of this delicacy may often be seen growing in tubs, boxes, or even upon simple wide boards lying upon the ground.

When we are told that the average daily production of the Paris Mushroom growers amounts to 25 tons, we may begin to realize something of the importance of the business. Of course this vast amount is not all consumed by the Parisians. On the contrary, a large proportion is preserved in various ways, for shipment to other cities and countries, and in many of the far inland towns of our own country we may purchase French Mushrooms at the better class of grocery stores at fancy prices.

The manner in which the greater part of these Mushrooms is produced, is full of interest. They are largely grown at a depth varying from 20 to 150 feet below the outside world. The only external marks of the points where this lucrative business is being carried on, are the long banks of stable manure, piled for fermentation and manipulation among the huge piles of white stone rubbish that are always found about the shafts of the quarries. The manure, gathered from the city, is collected into long piles where it is frequently pitched over to avoid violent fermentation. When the straw of which it is composed has lost its consistency, so that it is soft and unctuous to the touch, and has a brown color, it is lowered through the narrow shafts into the dark caverns, wherein the gloomy, tortuous passages, it is formed into long, narrow beds, preparatory to the reception of the spawn.

To one accustomed to gardening in the open air, the multitudinous difficulties of this subterranean culture must seem well nigh intolerable. The sunlight, of course, never penetrates the winding caverns, and all labor must be performed by artificial light. Now the jutting rocks above hang so low that one must stoop to avoid relentless bumps; now the rugged walls stand so close that one can only pass by walking sidewise; even where the limits of the somber passages are such as to afford abundant room, the omnipresent beds often lie so close together that the visitor fears lest a stumble in the half-relieved darkness should pitch him headlong upon them. Nevertheless, amid these dark and echoing dungeons many

busy hands find employment and livelihood.

Exhausted beds are removed, and new ones are arranged every day in the year. The manure, after having been carried to the proper stage of decomposition in the open air, is laid up in beds about 20 inches wide, and of equal height, the top being rounded somewhat. The beds are of various lengths dependent upon the space within the chamber. They are "spawned" by inserting bits of manure from a bed already permeated with the mycelia of the Mushroom. After inserting the spawn, the beds are covered with about an inch of soil, composed of three parts of the white sifted rubbish of the quarry, and one part fine, dry earth. In a few days after the spawning, the small Mushrooms or "buttons" begin to appear, and are fit for gathering in a day or two longer. The duration of the crop varies from forty days to three months after the first Mushrooms are fit for use, the length of time depending upon the height of the roof of the caverns, the season of the year, the method of culture, etc. The grower must practice much skill and vigilance, or his work may go for naught. The watering of the beds is an operation which requires much care, and in some quarries the water has to be carried long distances and lowered into the quarries in barrels. The ventilation of the caverns must also be attended to, as the decomposition of so much manure generates gases that would, if confined, soon become fatal both to Mushroom and human life. Then, as in our open air gardens, there are insects and mildews to be guarded against. All in all, we think the Mushroom grower should be well paid, as he generally is, for the markets are always hungry for his delicate wares.

The Mushroom caves are under government supervision, and are regularly inspected. They are owned by private individuals, and are generally leased to the Mushroom growers, the rentals varying from \$30 to \$80 per month, according to the extent and height of the galleries, the facilities of ventilation, etc. "E.L.M."

JAPANESE WINDOW GARDENING.

Among the Japanese the love of flowers and plants is an absorbing passion. In the smallest of dwellings there is an altar-like niche in or upon which flowering plants are arranged, but they have in some districts a most remarkable custom in connection with window gardening.

In houses wherein reside one or more daughters of a marriageable age, an empty flower-pot of an ornamental character is encircled by a ring, and suspended from the window or verandah by three light chains.

Now the Julietts of Japan are of course attractive, and their Romeos as love-sick as those of other lands. But instead of serenades by moonlight and other delicate ways of making an impression, it is etiquette for the of Japanese lover to approach the dwelling of his lady, bearing some choice plant in his hand, which he boldly, but, let us hope reverently, proceeds to plant in the empty vase. This takes place at a time when he is fully assured that both mother and daughter are at home, and I need scarcely say neither of them are at all conscious that the young man is taking such a liberty with the flower-

pot outside of their window. It is believed that a young lover so engaged has never been seen by his lady or her mamma in this act of sacrilege; at any rate a friend tells me that during his long residence in Japan he never heard of anyone being detected in the act, or interfered with in any way.

The fact is, this act of placing a pretty plant into the empty flower-pot, is equivalent to a formal proposal to the young lady who dwells within. The youthful gardener having settled his plant to his mind, retires, and the lady is free to act as she pleases.

If he is the right man, she takes every care of his gift, waters it, and tends it carefully with her own hands, that all the world may see and know that the donor is accepted as a suitor. But if he is not a favorite, or if stern parents object, the plant is removed from the vase, and the next morning finds it withered on the verandah, or on the path below. In a word, if you are not the right man, it is evident that this phase of window gardening must be a difficult and disappointing one to carry on in Japan.—From an address by F. W. Burbidge.

ISLAND OF BARBADOES.

Barbadoes is quite a contrast to the other tropical islands from the absence of mountainous character, comparatively speaking, the gentleness of its slopes, and the extent of its cultivated area; there is scarcely any waste land, and as with an area of 162 square miles, it has 162,000 inhabitants, it is necessary to cultivate it pretty thoroughly to maintain them all. We enjoy the island, nevertheless, very much; the drives over the splendid coral roads, almost as smooth as the asphalt pavement, in the cool of the morning and evening, are delightful, and the temperature of the sea water is just right for bathing.

The old-fashioned windmills, with their huge, solid stone towers and four long arms, are quite quaint, and the groups of the Cabbage (Royal) Palm at every plantation, towering high above everything else, give an air of novelty as well as beauty to the stranger from the North.

Numerous fields are to be seen of the Eddoes, or edible Caladiums grown for food, and of the Guinea Corn, which is an edible grain. [Probably a sorghum.]

The private gardens are flaunting with large Poinsettias, beautiful variegated Caladiums, Crotons, Coleus, and other foliage plants. Even the little negro huts have plots in front with choice varieties of Coleus and Crotons growing therein.

Trees of the Frangipani, with its deliciously scented flowers of white or rose color; the Ceiba tree, or Silk Cotton, with its dense light-green foliage, and massive trunk with its singular buttresses thrown out high above the roots; the Bearded Fig-tree, from which the island is said to have obtained its name, given by the Spaniards, *barbados*, bearded, from its roots hanging down from the branches, like a beard, and sometimes striking root and growing into stems, like the Banyan; the *Ficus nitida*, Garden Mangrove, with its exceedingly dense, dark-green foliage, spreading sometimes to a diameter of 100 feet, all have their interest to one having any botanical taste.—J. F. Flagg; in *Vick's Magazine*.

Exhibitions & Societies.

NEW YORK HORTICULTURAL SOCIETY.

Among the many beautiful plants and flowers shown at the May meeting of this society, the most noteworthy were the magnificent Geraniums and Pelargoniums from Hallock & Thorpe, comprising several entirely new shades of color. The same firm exhibited also a large collection of Carnations, several Orchids and other plants.

John Farrell, gardener to Wm. Barr, excelled himself. His exhibits filled an entire table. He makes a specialty of Cinerarias and Calceolarias, and his success with them was evident from the very excellent specimens shown. Two large, Staghorn Ferns attracted much attention, and a number of Chrysanthemums in bloom looked odd enough at this season.

Wm. C. Clement, gardener to Mrs. M. G. Morgan, took, as usual, the palm for Orchids, and all the specimens shown were remarkably well grown. Specially noteworthy were *Dendrobium Parishii*, *D. Cambridgeanum*, *Odontoglossum pescatorei*, *O. Roezii album*, *Cattleya Schilleriana*, *Epidendrum Wallisii*, *Cypripedium niveum*, *C. superciliosum*, *C. barbatum*, *C. Warneri*, *C. marmorophyllum*, *Oncidium Marshalli*, *O. concolor*, *Angraecum sesquipedale*, this latter one of the finest specimens in the country. About a dozen magnificent specimens of *Laelia majalis* and *Cattleya citrina* were shown by James Taplin.

Wm. Bennett made a grand display of Anthuriums. A single plant of *A. Hardii* with a dozen flowers, was an exhibition in itself; this was sold after the meeting for \$100. The same exhibitor had a dozen of *Cypripedium niveum* in pots, *C. Laurencianum*, a superb specimen of *Dracena Lindenii*, *Asparagus plumosus*, *Clerodendron Balfourii*.

Albert Benz gloried in Pansies, of which he made a most attractive and tastefully arranged exhibit. A single flower measured nearly three inches in diameter. In Lilies of the Valley he was equally successful.

W. C. Wilson made a varied exhibition, comprising Orchids, Lilies of the Valley, Hyacinths, Polyanthus, etc.

John Henderson's Roses were as usual of unsurpassed excellence, and formed a principal center of attraction.

In cut flowers, Chas. E. Parnell took all honors, his exhibit being one of the most varied and meritorious of the kind ever placed upon the tables of the society.

Vegetables and fruits were rather meagerly represented, the best being plates of Black Hamburg and Bowood Muscat Grapes, the latter bunches being 12 inches long. These were from Reuben Powell, gardener to Chas. Butler of Fox Meadow Gardens.

AMERICAN NURSERYMEN'S ASSOCIATION.

The tenth annual meeting of this society will be held at Chicago from June 17th to 20th, and is expected to be one of the most interesting gatherings of the kind that ever took place. The influence and usefulness of this association are extending with every year, and its meetings are not only of great business value to its members and those in the trade, but highly enjoyable as well. Among the objects sought by the associa-

tion are: The cultivation of personal acquaintance with others engaged in the trade. The exchange and sale of nursery products, implements and labor-saving devices. The exhibition and introduction of new varieties of fruits, trees, plants, etc. The perfection of better methods of culture, grading, packing and sale of stock. To procure quicker transit, more reasonable rates, and avoiding needless exposure of nursery products when in transit. To avoid the evils of dishonest tree agents, etc., etc.

Circulars, conditions of membership, and other information may be obtained from D. Wilnot Scott, Secretary, Galena, Ill.

MARYLAND HORTICULTURAL SOCIETY.

The beautiful concert room in the Academy of Music was thronged with visitors to the April Exhibition of the Maryland Horticultural Society. The show could not be called a large one as to the number of exhibits, but average excellence of the plants shown largely atoned for the small number of exhibitors.

The most conspicuous table, both in size and excellence of the plants, was that of Mr. Donald Grant, the skillful and intelligent gardener to Mr. T. Harrison Garrett. Mr. Grant had some remarkably fine Azaleas for so late in the season, and also a fine lot of stove and greenhouse plants. His Orchids were one of the chief attractions, and were not only fine specimens of culture, but were magnificently bloomed. We noticed *Dendrobium Thyrsoiflorum*, *D. chrysotozum superbum*, *D. Cambridgeanum*; *Cattleya speciosissima*, *intermedia*, *Skinnerii*, *Forbesii*, and *Wagnerii*; *Cypripedium caudatum*, *Laurenceanum*, and *barbatum*; *Saccolabium curvifolium*; *Odontoglossum Roezii*; *Oncidium Weltonii*, *Aspasia epidendroides*; *Lycaste Harrisonii*; *Mazillaria Tetracornia*, *Catogyne Parishii* and *Cyrtopodium Andersonii*.

Mr. E. Hoen showed some remarkable fine Azaleas which took the first premium, a plant in bloom of the curious Indian Lilac and well bloomed plants of *Dendrobium Pierardii latifolium*; *Cattleya Mossie* and *Epidendrum Parkinsonii*.

From the City Conservatory at Patterson Park, Mr. Archibald Anderson, superintendent, sent a choice collection of greenhouse plants and a handsome lot of Remontant Roses in pots, clean, healthy plants, and well bloomed.

Among the professionals, Mr. Charles Hamilton, of Waverly, had a choice lot of seedling Amaryllis which were very much admired. Mr. H. is making a specialty of Amaryllis, and his seedlings are equal to any of the high-priced sorts from abroad.

Samuel Feast & Son (I. E. Feast), the veteran house in the trade, have had a small but well grown exhibit, including a fine collection of Ferns, a very beautiful hanging basket entirely filled with the feathery *Asparagus tenuissimus*, some handsome Palms of moderate size, and two splendid specimens of Marechal Niel Rose in pots. These were fully seven feet high, well trained, and loaded with flowers, and attracted a great deal of attention.

Mr. Jno. Dan had some handsome show Pelargoniums, fine Verbenas and Pansies. Mr. Jno. Miller had a table filled with well grown Fuchsias. Mr. Green, the active man-

ager of Richard Cromwell's Nurseries, had a table of Zonal Geraniums, which was gorgeous with bloom of many hues, on well grown plants.

The cut flower tables were conspicuous for the almost entire absence of the prominent florists who usually make a gorgeous display. Only one design, a very handsome one by Miss Patterson of Waverly, was shown. Mr. Pentland had some fine Pansies and a box of Camellia flowers, which were remarkably good for so late in the season.

It is to be regretted that the florists generally seem inclined to hold aloof from the society, which has in the past done a great deal of good to the cause of horticulture, and is capable of doing much more if properly conducted. HORTICOLA.

AMERICAN INSTITUTE FARMERS' CLUB.

From the first of May the Institute has secured for its future home a part of Clinton Hall, where commodious offices, library, and meeting room are now being fitted up. The Farmers' Club has therefore adjourned until these will be ready. The inaugural meeting in the new hall will be held in connection with the proposed Strawberry and Rose Exhibition. All those interested or intending to exhibit, may obtain circulars and premium lists by addressing the secretary, Mr. D. R. Garden, American Institute, New York City.

SUBTERRANEAN IRRIGATION.

An elaborate address on a new system of irrigation and drainage combined was delivered by Hon. A. N. Cole of Wellsville, N. Y., at a recent meeting.

The system which is more specially adapted for sloping surfaces consists in the main in making a number of horizontal trenches or reservoirs, and connecting them by drain tiles.

"Beginning on the lower side of the plot to be irrigated, or the side on which drainage can best be secured from," said Mr. Cole, "a trench is sunk through the surface soil, and into the sub-soil three or more feet in depth and the same in width. One or more rods from this trench, and parallel with it, another is sunk in the same way. Connecting the two is then made an overflow trench just far enough below the surface to escape the tools used in working the ground, and the bottom of which shall not come within two and one-half feet or more of the bottom of the large trenches. (Drain pipe of any kind may be used for these connections.) The main trenches are then filled with large stones, placed in such a way as to leave all the water space possible, to the top of the sub-soil.

"Over these are then put the small stone taken from the soil, and over these, leaves, straw or cut weeds. This is done for the purpose of keeping the soil from washing down into the trenches. This covering should be brought up to within about 12 inches or more of the original surface of the ground. Over this replace the surface soil again. Construct and connect in this way trenches enough to cover the plot. From your first or lowest trench construct an outlet or overflow drain which shall carry off all the overflow of the systems.

"Your system is now complete, and ready for action, which is as follows. With the melting of the snows of spring and the

heavy spring rains the trenches fill, thus storing beneath the surface of your ground, hundreds of barrels of water ready for use when necessary. As long as there is sufficient moisture in the soil, this water is undisturbed, but as soon as the soil becomes dry, and the growing vegetation requires water, nature sets at work her pumps, natural absorption of the soil, solar evaporation, and capillary attraction, and draws towards the surface and to the roots of the growing vegetation, the stored waters, furnishing at all times the moisture necessary to bring to perfect development of growth or fruitage the crops upon the ground."

The results which are said to have been produced under this system are astounding, and seem to fully warrant the necessary expenditure. A committee was appointed to visit Mr. Cole's place during the growing season, and it is with considerable interest that we look for the committee's report.

ARGENTINE RURAL EXHIBITION.

With the coöperation of the Government of the Argentine Republic, and that of the Province of Buenos Ayres, the Argentine Rural Society will hold in the city of Buenos Ayres an International Rural Exhibition, to commence the 25th of April, 1886. The Premium list is divided into over 400 classes, comprising every kind of agricultural and horticultural products. No other South American state offers so inviting a field for the extension of our commerce as the Argentine Republic, and it is very desirable that the products and manufactures of the United States be fully and creditably represented at this exhibition.

FLORICULTURE AT NEW ORLEANS.

As a whole, the floricultural part of the New Orleans exhibition cannot be said to have been a success, although some of the exhibits were highly interesting and valuable. Fortunately the natural beauty of the grounds, studded with innumerable Oaks, shading the grounds with their far-spreading, low-hanging, moss-clad branches, produced a most charming scenic effect, unaided by human art.

By far the most prominent floral feature during the spring months, was the magnificent display of spring-flowering bulbs, or Dutch bulbs,—as they are popularly called,—made by the General Bulb Company of Holland through their American representative, Mr. J. A. De Veer of New York, and under the immediate charge of Mr. William H. Boomkamp. In extent, beauty, tasteful arrangement and intrinsic merit, this exhibit was certainly never equalled in our country. It would require a book to name and describe all the species and varieties comprised in it. There were 110 varieties of Hyacinths, 136 of Tulips, 50 of Crocuses, and Narcissus, Ranunculus, Anemones, etc., in proportion. Of course they were awarded all the first-class prizes, including that for the best general exhibit to occupy not less than 10,000 square feet of ground, a gold medal, four silver medals and \$400.

An immense crescent-shaped bed of Pansies, representing every possible shade, from the most delicate tints to nearly black, produced a brilliant effect and was greatly admired. This was made by J. Nelson, of New Orleans, who had also a large collection of *Phlox Drummondii*.

Most visitors from the North were here before all these beauties were in bloom, and therefore took home with them the impression that there were no flowers here, but those who saw the grounds when the Dutch bulbs were at their best, thought that to behold this glorious sight was alone worth the journey.

NEW ORLEANS.

AMERICAN SEED TRADE ASSOCIATION.

The third annual meeting of this association will be held in Rochester, N. Y., from June 9th to 11th. The organization was formed for the mutual benefit of all those engaged in raising and selling seeds, to promote better acquaintanceship between its members, and to devise means and measures to facilitate trade and friendly relations between its members. A very large and interesting meeting is anticipated, and seedsmen who are not already members, will find it to their advantage to have their names enrolled. All information in relation to this may be obtained from the secretary, James Y. Markland, 18 Cortlandt St., New York.

AGRICULTURAL CONVENTION AT WASHINGTON.

Col. Colman, the Commissioner of Agriculture, invites all agricultural colleges and experiment stations to send one or more delegates each, to a convention to be held at the Agricultural Department building in Washington. The meeting will begin at 10 A. M., June 24th.

OF THE EARTH, EARTHY.

From the sanitarian's standpoint, one might well say, "Let me build the cellars for the people and I care not who rears the superstructures." The latter may be badly ventilated, imperfectly lighted and insufficiently warmed; they may be hot in Summer, cold in Winter, leaky as to their roofs and shaky as to their floors, but if the cellars are what cellars ought to be, clean, open, dry, light and airy, the most serious danger will be avoided. Of course much depends upon location, but even under the most favorable circumstances the exhalations from the earth enclosed by the foundation walls constitute an unknown element, and whether actively poisonous or apparently harmless, it is certain that the ground atmosphere is not well adapted to human consumption till it has been rectified by the sun and other purifying influences that belong above ground.

When the doors and windows of a house are closed for several weeks or months, especially if sunlight is also excluded, the rooms are almost sure to be found pervaded with a musty, sepulchral odor, even though the building is entirely empty, apparently dry and free from all symptoms of dust and decay. It smells of the earth, earthy, and for the simple reason that the particular bit of the earth's surface upon which it stands has been breathing into the house all the time, and its breath, like all expired air, is liable to be impure. If the house had been placed a few feet above the surface of the ground upon posts, leaving a clean, open sweep for the air underneath it, the rooms would be no more vitiated than a hang-bird's nest or an empty corn-crib. Opening all the cellar windows would be partially effective to the same end, but not fully so, because the wind does not always blow

with sufficient force to keep the air of the cellar from rising through the loose floors that are commonly laid directly above the cellar in dwelling-houses.

There are two points, then, of great importance in the building of cellars. One, that the floor of the cellar, not the walls merely or chiefly, for that is not so essential, but the floors should be made by the use of cement and asphaltum as impervious to air and moisture as possible. The other, that the cellar should be amply ventilated at all times. It is not enough to say that, since we do not live in the cellar, it is therefore of small consequence what the quality of the air may be, for, whether we perceive it or not, the atmosphere in the rooms above an unclean cellar is sure to be more or less contaminated from below, for in Winter and in Summer its constant tendency is to rise. Board floors and wool carpets will no more keep these evil elements in subjection than stone vaults and brazen doors will keep down a troubled ghost that is bent on rising. Once admitted to the cellar, they will climb through the rooms above unless coaxed or driven out into the open air.—*The Builder*.

ARRANGEMENT OF ROSES.

Taste in the arrangement of flowers is fortunately not subject to unanimity of sentiment, else we should soon be wearied with a continual sameness, nevertheless there are certain fixed laws that regulate the decorative art in flowers. In regard to these, J. H. Bourn said, at a recent meeting of the Massachusetts Horticultural Society:

"Too many blooms are used for single baskets and bouquets, where they are crowded together promiscuously, exhibiting a mass of petals, the form and color of each separate flower being indistinct, with little of its own foliage to render the proper effect. The more nearly Roses are shown as they naturally grow, the handsomer they are. The stiff artificial stem, without the leaf of the flower, propped up by Smilax, Ferns, and other green things than its own foliage, is not Nature.

"Hand bouquets of Roses and buds are more beautiful when made of one variety with its own foliage, stems long and loosely bunched, having a small number, well chosen, of sweet odor.

"A collection in basket form or for parlor decoration had better lack a flower than have one too many, the object being to form a graceful, refreshing and suggestive picture, preserving an 'easy negligence mixed with art.' Show each bloom separately, reposing in its own green, and a few colors have a better effect than many. If a combination is thought to be desirable, red, white and buff form a pleasing one. The beauty of Roses is much enhanced in masses.

"As a rule, if there are to be many flowers, use the delicate shades; if few, the deeper tones. Large, choice Roses are always more effective when displayed in proper standards for their reception as single specimens."

Reports of local fruit and flower shows, and of general horticultural exhibitions, will be acceptable to THE AMERICAN GARDEN from any of our readers in any part of the world.

Rural Life.

GIRLS IN THE GARDEN.

If there is anything more conducive to the health of girls and young women than some regular, systematic, light garden work we should like to know what it is; surely it is not to be found in the drug store. Thousands of frail, listless, pale-faced girls to whom the world seems a burden, could transform themselves into healthy, happy, joyful beings, by this simple remedy. We offer it without charge, if you will only try it.

Commence some pleasant, cool morning, after breakfast, not before, until you are considerably stronger—by making a small flower-bed, sowing a few seeds, planting some bedding plants, or tying up a climbing Rose or a Honeysuckle. Make it your regular business every day to spend an hour in your garden, watching and caring for your plants. It does not matter how small the beginning is. In fact, the less you undertake at first, provided you do it well, the better will be your success. The main point to secure is to create an interest in your work, and this cannot be accomplished if you overwork yourself and become discouraged at the start. To be promotive of good the work must be a pleasure, not hardship.

HORTICULTURAL ADORNMENT.

Near all our large cities there are many small or moderate-sized homes belonging to that highly-respected class of the community who are yet engaged in active business in the cities, and who have become possessed of a small tract of land in the country. It may be from a love of rural surroundings and an attachment for country life formed in boyhood, or from a desire to obtain more relaxation for themselves and surround their families with that abundance of fresh air, pure water and the facilities for healthful enjoyment not to be obtained in a city home. This class, whatever may have been the motives which have prompted them, is very numerous and rapidly increasing.

The owners of these homes are generally inclined to immediately commence to adorn their possessions, but are frequently ignorant of how to do this, though theoretically they may be well informed in book knowledge and catalogue literature. They come to the country with an ardor and desire to partake of its comforts, luxuries and enjoyments. They purchase their cow and chickens and expect from them to derive at once all the benefits of an abundance of milk, butter and eggs. They then look to the nursery man to supply them with trees that will bear fruit the first season without fail and continuously during their natural lives. They have one acre or more of land, and usually expect from this all the products of a place ten times the size, and frequently, as a consequence, their trees, plants and vines are set out so close together that the results from none of them are satisfactory.

'Twere well for all when planting out an orchard or garden to consult the tables laid down by long experience as to the proper distances for planting. I admit to many the distance may seem unnecessary at the time, but rest assured that if the trees grow and thrive as they should under good cultivation

they will eventually produce better results than if twice the number were planted.

Our city farmer, having planted his fruit-trees, desires the further adornment of his rural home, especially so if his dwelling has been built on a new site and lacks protection from the summer's sun or winter's blast. He secures, most likely, the largest trees that can be transplanted and places them unnaturally close to his residence, and thinks it strange he cannot stretch his hammock beneath their luxuriant shade the first summer. This planting of trees so near a dwelling as to prevent the free circulation of air around it is an error. It is the shadow, not the branches, that should strike the house.

Again, it is not necessary that a tree should be excessively large when moved to make a quick and abundant shade. A fine, thrifty, healthy tree, of moderate growth, in nine cases out of ten, will in five years give more shade and become a finer tree than the excessively large one.

An additional ornamentation of these homes with flowering shrubs and evergreen trees, judiciously interspersed, and fencing the lawn with an evergreen hedge of American Arbor Vitæ or Hemlock Spruce, will do much to beautify and adorn them both in summer and in winter. For what can be more ornamental in summer than the contrast between a beautifully kept greensward and a clump of handsome flowering shrubs; or in winter the dark foliage of evergreens in contrast with the snowy canopy of mother earth?

But there is another class of country residents that, I fear, is not so fully convinced of the desirability and advantages of the embellishment of their rural homes. Many of our farmers consider any outlay in this direction rather as an extravagance; they do not realize the effects of making home attractive in this way, and the influence it may exert on the younger members of the family. They may have provided an abundance of Grape-vines and small fruits, and an inexhaustible supply of orchard fruits, thinking in doing this they had done all that was necessary to make home attractive and comfortable. But not so, according to the injunction,—“These ought ye to have done and not have left the other undone.”

The expenditure of a small amount of money in the purchase of ornamental trees, shrubs, Roses and climbing plants, and their proper arrangement, so as to produce the needful shade and at the same time to hide any unsightly objects from view, will well repay for the investment.

Many farmers look upon ground devoted to a lawn or yard as little better than wasted, and feel that they can ill afford to set aside half an acre or more around their dwelling, in which they may in all probability spend the remainder of their lives. They count the loss thus sustained by the number of bushels of Corn, Oats or Potatoes that said land would yield annually. But too often I fear these same farmers neglect to count the land wasted in improvised rockeries, covered with Dewberry and Poison Vines, unsightly fence corners or hedges of Sumac and Elder that in all probability infest their farms. Have your yard and dispense with these unsightly objects, and your farm will be quite as profitable and far more attractive.

There is something pleasant about a rural

home that has been laid out and planted with some degree of taste and propriety. Though the buildings may be nothing more than ordinary, yet if there has been an appropriate interspersing of evergreens and deciduous trees in a manner that will break the winter's blasts from coming with undiminished violence against the dwelling, and a further adornment by shrubbery and ledges, there is something about such a home that will exert an influence on the younger generation, and may be the means of causing them to form a preference for a country life instead of seeking their fortunes in the large cities.

Surely the remunerative prices these farms with attractive farm buildings and pleasant surroundings bring when placed on the market should be an incentive to try to make our own so. When we couple with this the satisfaction there is in having one's lot cast in pleasant places, and one's family gathered around, as it were, beneath one's own Vine and Fig tree, there is that indescribable satisfaction and happiness which cannot be measured by mere dollars and cents, but will go very far toward compensating for the outlay necessary for the “Horticultural Adornment of our Rural Homes.”

—W. H. Moon before the Penn. Hort. Society.

COUNTRY JOYS.

Every industrious and healthy person, even if he begins life with nothing and secures a small yearly surplus from his earnings (and discards all worse than useless luxuries mis-called such), says John J. Thomas, may secure for himself a pleasant and comfortable place of his own.

I once counted within the contracted enclosure of a friend living in a compact part of New York city, no less than forty species of ornamental plants, besides his Currants, Raspberries, and Grapes. But the country resident has greater opportunity than this, and a much wider field for working. It is here that influential horticulturists may exert an immense benefit in the way of adding to the enjoyment and happiness of others by promoting such improvements. They can show how practicable it is to obtain a supply of fruits the year through, and the beauties and benefits of ornamental planting.

The horticulturist has, within his own grounds, the opportunities for constant intellectual enjoyment. The pleasure afforded by the labors of propagation, planting, pruning, and culture—in watching the swelling buds of spring, the bursting blossoms and the development of the various fruits of summer—the grandeur of nature's foliage, and the magnificence of the wide landscape with its clouds and skies, these enjoyments cannot be obtained by those who spend all their time and every thought in bending down to the earth in making money. I do not say that the culture of fruit and flowers can completely fill the measure of happiness in this present life, nor supply what Christianity alone can give, which stands, in its influence, above all else, like an edifice of glory, perfect in form and radiance; but horticulture may continue its spotless column with wreaths of beauty, and thus become an invaluable aid in benefiting the human race. It is here that nurserymen and florists have before them a noble and sublime mission in exalting rural art.

Miscellaneous.

JUNE FLOWER STYLES.

The wild-flower craze began in May and is not over yet. In favorable weather parties of young people make trips to the woods in the suburbs of New York, to gather the blossoms, and whatever is pretty in the way of foliage. The most charming baskets of wild growth are brought back, and the ferns and vines and "tangled creepers" are lovelier than any foliage now offered in the flower-stores. Violets, Marsh Marigolds, Hepatica and Arbutus were gathered in May, and now the name is Legion of the tender blossoms gathered in wood, field, meadow, by the wayside, and among the salt grasses of New Jersey marshes.

GARDEN PARTIES.

June garden parties are the favorite entertainment at this season. The *Fête Champêtre* is enjoyed far better than any party given in-doors. Floral decorations have been on an extensive scale, arches, pagodas, and covered ways being wreathed and thatched with flowers. The blossoms of shrubs and the large Peonies now in flower have been used in these elaborate arrangements, being more effective than Roses which drop their petals so soon at this time of year.

Hanging-baskets swung on trees have been employed, and brackets of growing plants, ingeniously fastened to rustic summer-houses, have added much grace to the lawn-party decorations. A very handsome floral display was made in a Staten Island garden last week. It was rumored that some large blossoms massed on the top of an archway were tissue paper. They looked so natural that no one could tell if they were counterfeit, and they were too high up to examine closely.

DAISY DINNERS AND PANSY LUNCHEONS

Have been fashionable with young ladies entertaining friends about departing for Europe. The prevailing style is to have the favors, which are usually bouquets de corsage, placed in large silver or glass bowls along the center of the table, where they can be admired during the feast, and distributed after it.

STEAMER FASHIONS.

The floral souvenirs for friends departing on the steamships are very elegant, several new and rich designs having been made that are expressive and suitable for the occasion. Hand-satchels of light straw are almost covered on the sides with clusters of Moss Rose-buds, and are filled with bunches of Forget-me-nots, the bag being left half-way open. A tin piece fitting in the bottom of the bag contains wet moss, in which the stems of the flowers are plunged.

The display of flowers on the steamers leaving the port of New York has been magnificent this season. Baskets containing superb long stem Roses, panels of spring blossoms to hang in the stateroom, floral ships, and pyramids of flowering bulbs have been among these tokens of remembrance. On several occasions the florist has had orders for the entire decoration of a stateroom. This is done in a very pretty fashion, and is a delightful surprise to the person about to sail. Curtains of smilax, or *Asparagus tenu-*

issimus, are draped before the berths, which are caught back with ribbons. Lilies, Roses, and Forget-me-nots are distributed over the washstand and wherever there is a convenient place. Handsome decorations of Immortelles have been made in the stateroom.

A beautiful idea has been successfully carried out by friends of those accustomed to having fresh flowers daily. A certain number of corsage bunches are placed each in a separate box and put on ice in the great refrigerator of the ship. These are dated, and are to be daily presented to the lady who has been so kindly considered by the friend left behind.

There is a mistaken impression concerning flowers taken to sea: many persons believe these are cast overboard as soon as the vessel is outside Sandy Hook. This is not so. Flowers left in the saloon are watered faithfully by the stewards, and are placed on the table each day at dinner. The cool, moist air of the ocean seems to act as a preservative, and frequently, flowers are taken off the ship at Liverpool in a fair condition.

JUNE WEDDINGS.

A delightful style has just been introduced for June weddings. The bride carries a two-handled, soft-straw basket, which is entirely covered on one side with Niphetos buds and Maiden Hair Ferns; the other side is covered with pink Roses. Going into church she exposes the white flowers, and after the ceremony, when coming from the altar, the pink Roses are displayed.

Very large straw hats, the kind known as "Bloomer hats," are in vogue for bridesmaid's bouquets. These hats are caught together at the rim by satin ribbons, and are filled with Roses and trailing foliage. For a wedding last week, six bridesmaids carried these hats full of Roses, each hat containing flowers of a different tint, swung on their arms with satin ribbons. There were two little girls who were the "maids of honor." They carried Leghorn hats filled with Daisies on their arms, and wore Daisy wreaths on their heads.

FLOWER APRONS.

Small aprons of flowers are novel favors presented at June entertainments. These are exceedingly pretty for German favors at lawn parties. A florist made 30 of these aprons lately, for a garden party given at Yonkers. The foundation was surah silk of delicate tint, upon which the flowers were so neatly caught that the stitches did not show. A pink silk apron which had a border of the Mignonette Polyanthus Rose around it, and bretelles or "wings" covered with sprays of these fairy, blush Roses, was a dainty garment. A blue silk apron was fringed with Corn-flowers, *Centaurea cyanus*, and a lavender silk one was exquisitely festooned with Heliotrope.

SUNDAY FLOWERS.

There is a large trade in cut flowers Sundays in New York, supplying ladies on their way to church with a corsage bunch of flowers, and gentlemen with a boutonniere. Flowers are ordered regularly for a number of New York churches every Sabbath. These are usually arranged on and around the pulpit, blooming plants being included in several of these weekly decorations.

In a number of the Sunday Schools, flowers and plants are distributed. The nose-gays are given instead of tickets of merit to the children who are punctual, and a plant

is presented now and then to those who are regularly in their place. This floral distribution in the Sabbath School is not an expensive item, as the large plant-growers sell very reasonably to supply this demand, and are very generous with cut flowers for the Sunday presentations.

WATER LILIES.

Water Lilies are a favorite flower for street-wear this month. As many as a dozen, including the green, polished buds, are worn at the belt, the long, sedgy stems being left to fall below the waist. For a boating party given on Silver Lake, Staten Island, last week, the ladies all wore Pond Lilies on their hats and on the corsage. It is quite fashionable to pin a cluster on the sun-umbrella. They are effective wherever placed.

City florists are making elaborate preparations to supply the leading watering-place hotels with handsome flowers. We shall give a full account next month of flowers at Newport, Long Branch, and Saratoga.

FLORA.

TRANSPLANTING NUT TREES.

Transplanting nut-bearing trees, both naturally and nursery grown, is generally considered a decidedly hazardous undertaking. When properly treated, however, there need be but little risk.

That nut-bearing trees are difficult to transplant when nursery grown, is not for a moment believed anywhere in Europe, says Prof. J. L. Budd, in the Iowa Homestead. All that is needed is to transplant when young, or to cut the tap roots, as is done in the old nurseries with the ornamental Oaks and other deep-rooting trees. In all Europe, nut-bearing trees are as common in well-managed nurseries as fruit trees. Where grown systematically in nursery, the best varieties of the Black Walnut, Butternut and Shell-bark Hickory should be selected, and varieties of the Filbert equal to the best found in the market might be common in all the south part of Iowa. Nor is it necessary to be confined to our native trees.

In Poland, Hungary, Silesia, and even south Russia, as far north as Kiev, are grown abundant crops of *Juglans regia* (English Walnut). The nuts of these northern varieties of this choice species, can be imported cheaply in any quantity. All it needs is an enterprising nurseryman to set the ball in motion. In the southern counties of the State, several varieties of the Pecan would also prove hardy in sheltered positions on the loess formations and perhaps on any dry soil on the open prairie.

THE FOUR ESSENTIALS OF A HOUSE.

In planning a house, says the author of *Farm Homes*, let four essential points be kept in view: Drainage, Sunlight, Ventilation, and a Bath-room. These features can be compassed even in the smallest cottage, and yet thousands of farm-houses are being completed to-day without a thought of them. It is cheering to reflect, however, that other thousands of farm-houses are going up wherein these vital considerations have been kept first and foremost. Progress in building-reform is unnecessarily slow, especially in the newer States, and wives and daughters should set themselves to thinking and studying about these things, and to hasten on the millennium of right living.

AMONG THE FLORISTS. AT FLORAL.

Mr. John Lewis Childs was very happy in the choice of the name, Floral, which he induced Uncle Sam to give his post office, and happily successful in getting the post office established, in spite of considerable opposition. He is doing a thriving business, and his large mail trade demanded this convenience. Nowhere have we seen a more complete and business-like system for packing and shipping plants and seeds. Under it, error seems hardly possible, and labor and time are reduced to a minimum. Mr. Childs believes in having large stocks of a few of the best and most popular varieties and a few novelties. By this means his attention is not divided, and he is enabled to devote his time largely to pushing the sales, which he has so far done with marked success.

AT QUEENS.

Messrs. Hallock & Thorpe were in the rush of spring trade when I stepped into their office last March, and their faces showed the satisfied and expectant look of men reaping the results of a year of hard preparatory work. Mr. Thorpe escorted me among his pets with all the pride of a true lover of his work. He lingered lovingly among his Carnations, than which there are few if any finer collections, and which Mr. Thorpe has done so much to improve. He predicted that they will run the Rose hard for popularity within two years. Some of the new sorts, not yet introduced, will have only to show their healthy, beautiful faces to win favor in the sight of the fair. Messrs. H. & T. have had great success with the Swanley White Violet, having sold 2,000 blossoms a week through the season. Their collection of Chrysanthemums is one of the first in the world, both in size and quality, and includes 69 new, and 479 old sorts. They sold 15,000 plants during the season.

The new *Azalea unguis* is hybrid in the species and very showy. *A. imbricata* is quite new and distinct, and desirable. Among the new Primroses was seen the Gilbert's Harbinger, of the Polyantha or "fancy" type.

Their new Geraniums seem as popular as ever, and are having a decided run. Since our previous visit in 1883, their houses had increased in number by three or four, and their facilities for trade in like proportion. Fortune smiles upon these gentlemen for the good work they are doing.

AT BRATTLEBORO, VT.

Mr. C. E. Allen began business in 1868, a lad of 17, borrowing a little land of his father as a beginning. This land was paid for long ago, and above 20 acres besides, and recently he has added 17 acres more. Seven acres are in Strawberries, and several acres in nursery for small fruits and hardy plants. He has seven or eight good houses, where he grows a large assortment of fine plants. His Pelargoniums in May made a fine show and were a large collection. His Geraniums were a fine lot of most of the best sorts. In one house was a perennial bank of Heliotrope (Chieftain and Peruvianum) against a wall. The plants made a mass three and a half to four feet high, were healthy and full of flowers, and furnished a constant supply for cutting. The stocks throughout were in fine condition, and showed the reason for Mr. A.'s growing trade.

ANSWERS TO CORRESPONDENTS.

Grass Pink. *C. B., Omaha, Neb.*—The Grass or Garden Pink is perfectly hardy, but in a northern climate it will be much benefited by a winter mulch. To keep them in good condition they should be renewed every year by cuttings or layers. The latter mode is the easiest in a small way, and the best time for layering is just after the bloom is over. When rooted, the layers have to be detached and transplanted. A mellow loam well enriched with decomposed stable manure is the best soil for them.

Lily of the Valley. *B. H. W., Adrian, Mich.*—Sometimes a bed of Lilies of the Valley will last forever, but mostly the plants become so crowded that after about six years they lose their vigor and should be thinned out. This is best done by digging out alternate strips of about one foot wide through the bed, and filling in the space with soil and manure.

Celery. *Reader, Ohio.*—This was described in a recent number. It is a variety of Celery with enlarged root. The cultivation is the same as that of the ordinary Celery, except that it is not hilled up. The root, which is of irregular, globular shape, and of the size of garden Beets, is used in soups and principally as salad.

Planting Strawberries in June.—A subscriber residing in New York says: "On account of building an addition to my house, the ground where I intend to make a Strawberry bed will not be ready before June; will it do to plant so late in the season?" If the plants are in the same garden they may be transplanted at any time by taking up sufficient soil with them, but if they have to be procured from a distance, planting in June is not to be recommended. Better bring the ground in as good a condition as possible, and procure potted plants in July or August; they will give a better yield next year than old plants set out now.

Marechal Niel Rose again. *S. C. P., Laprairie, Canada.*—The article referred to treats on Rose-growing in England, which has so different a climate from our own that English methods cannot always be followed here. We have never seen a thrifty, blooming Marechal Niel Rose grown in a living-room, yet if the conditions which prove successful in the greenhouse can be provided in a window as well, there is no reason why similar results should not be produced. The principal points to be observed are to keep the plants in good growing condition till about September, then withhold water so as not to induce new growth, but not so much as to make the plant wilt. After the first sharp frost the pots are to be taken up, a few inches of the top soil removed and replaced with decomposed cow manure and loam. All branches should then be closely pruned and the plants placed in a temperature of 45° to 50° by night, and 65° to 70° by day, and if demanded for forcing, gradually raising the temperature from 75° to 80° by day and 55° by night.

OUR BOOK TABLE.

Summit County, Ohio, Horticultural Society. Report of meetings. President, Dr. M. Jewett; Secretary, M. Crawford.

The Tobacco Remedy, by Gen. T. L. Clingman. Orange Judd Company, New York, publishers. A large array of cases showing the efficacy of the external application of Tobacco as antispasmodic and in many cases of local inflammation.

New Jersey State Horticultural Society. Proceedings of the annual meeting held at Trenton, Dec. 23 and 30, 1881. This society, which counts among its members many of the most prominent horticulturists in the land, is doing a vast amount of good in developing and promoting the horticultural interests of its State. Its meetings are always well attended and the reports thereof are of permanent value. The present volume contains, in addition to the officer's addresses and reports, many highly interesting papers, among them: Strawberries, by J. B. Rogers, mention of which is made on another page of this number; Peach Culture, by Ralph Ege, J. D. Cole, and R. D. Cole; Floriculture, by James Tuplin and Theo. Edwards; Adornment of Public Grounds, by C. W. Howell; The Pleasure of Flowers, by John Tharpe; Peach Yellow, by Prof. S. T. Maynard; reports on the Comparative Fertility and Yield of Potatoes, by E. Williams, T. P. Barker, J. B. Rogers and N. W. Parcell. An especially valuable feature

of this report is the fruit list of the State, compiled by J. T. Lovett. With it one may learn at a glance the degree of adaptation and value of all the leading varieties of fruits grown in each county.

Orange and Fruit Culture, by Charles V. Mages, New York.—The widely varying effects of different fertilizers upon the quality of Grapes, Strawberries and various tree fruits, as well as upon the vigor and health of the plants and trees, are well known to careful observers. The Orange, however, has only so recently come under extensive cultivation in our country, that comparatively little study has been given to its special needs. Mr. C. V. Mages, who has probably given more attention to this subject than any other chemist or fruit grower, has some time since collected and sifted all the information about the Orange culture obtainable, and this, together with the results of his own experiments and conclusions, is embodied in this interesting pamphlet. It would be difficult to crowd more solid, practical information into an equal number of pages, although the author modestly states in his introductory remarks that, "They are intended more to invite further investigations and discussion than to afford a definite solution of the question," and he cordially invites cooperation and correspondence with experimenters and others interested in solving special problems in Orange and Fruit Fertilization.

TRADE NOTES.

ITEMS OF GENERAL INTEREST FROM THE SEED, NURSERY AND FLOWER TRADE ARE SOLICITED.

Joseph Bree & Sons report a large trade in Strawberry plants.

C. E. Allen of Brattleboro, Vt., is well pleased with his season's trade, which is fully a third greater than last year.

V. H. Hallock, Son & Thorpe have had so large a plant trade, that they were far behind their orders through most of the short shipping season.

A. Brackenridge, Govanstown, Md., is having a good trade. He believes in advertising judiciously, and thinks THE AMERICAN GARDEN has paid him.

The seed trade has undoubtedly been very large in the aggregate, but competition has cut down the business of many of the large houses in this line.

We notice that the weakness for "novelties" in name only, still holds many seedsmen by their pockets. Is a vigorous campaign necessary to stop this re-naming of old varieties?

The Cabbage plant trade is little pushed this year by the large seed houses. Competition by farmers and gardeners throughout the country has destroyed its profitability.

J. A. De Veer has connected with himself his energetic and gentlemanly associate, Mr. Boomkamp. De Veer & Boomkamp will now push the Dutch bulb trade from 19 Broadway, New York, where they have very pleasant quarters.

The plant trade is reported as having been very large in Boston, New York, Rochester, and Queens. Probably the same is true of Philadelphia and other centers of this interest, as well as among the florists and nurserymen at local points. Prices have been low, and probably satisfactory to buyers.

The Bennett Rose supply has been curtailed by failure of the contractors to put the heating apparatus into a portion of Mr. Evans' houses in proper season. What were saved in these houses were probably the hardiest and best of the lot, so that those who get any will get some very strong plants.

One of the worst causes of the poor condition of the seed trade seems to be the growing disposition of seed growers to sell direct to consumers, instead of through the regular houses. The result has been ruin to many reputable dealers, and no great gain to either the growers or consumers. Always an expensive business to conduct, great sales are necessary to its success. Seed growing is fairly profitable in the hands of men who understand it thoroughly, and will take pains to sell only No. 1 stocks; but to add to the risks of the business by taking on the expense of a retail trade, is poor policy. The writer speaks from experience.

**COLGATE & CO'S
CASHMERE BOUQUET PERFUME.**

The only weekly Journal in existence which is devoted exclusively to poultry. \$1.50 per year. Both periodicals to one address, \$2.

H. H. STODDARD, Editor and Publisher, Hartford, Ct.

The American Garden Prizes of \$1,000.

For New Fruits, Flowers and Vegetables.

For the promotion of horticulture, THE AMERICAN GARDEN offers the following prizes of \$100 each, or silver plate of equal value.

(a.) The varieties put in competition are to be shown at three or more State, National, or other equally important exhibitions, in 1885 and in 1886, under the rules of the societies where exhibited.

(1) For the best Grape which shall combine territorial adaptability with superior shipping and table qualities.

(2) For the best Strawberry which shall combine territorial adaptability with superior shipping and table qualities.

(3) For the best Raspberry which shall combine hardiness, productiveness and superior shipping and table qualities.

ditions as for (2). To be exhibited as above (a). \$100 or plate.

(4) For the best Gooseberry which shall combine large size, productiveness and freedom from mildew.

(5) For the best Blackberry which shall combine large size, good quality, hardiness and productiveness.

(6) For the best New Fruit (a new species is required) to thrive north of Virginia and Kansas.

(7) For the best new Potato which shall combine superior quality, productiveness, and freedom from disease.

(8) For the best new Vegetable other than Potato (either a new variety or species), table and shipping qualities and profitableness of culture to be considered.

(9) For the best new flowering Shrub which shall be hardy in the Northern States east of the Rocky Mountains.

(10) For the best new herbaceous Perennial flowering plant which shall be hardy in the Northern States east of the Rocky Mountains.

We shall make no claims or conditions whatsoever that would influence the naming or disposition of the prize-winning varieties.

The competition is open to North America.

The names of the committees will be announced as soon as the lists can be completed.

The above conditions will not be modified, except, possibly, to simplify them.

We invite suggestions, to the end of making the above offers as useful as possible.

Parties intending to compete are requested to inform the undersigned, for record.

Reports of judges on any new fruits, flowers, or vegetables at any exhibition in America are solicited.

(Signed) E. H. LIBBY, Greentield, Mass., May 1, 1885.

THE GREAT CALIFORNIA INSECT POWDER.

Perfectly Harmless to Animal and Plant Life. Manufactured from the pure Pyrethrum Cinerariæ Folium Blossoms grown by us in California, where "Buhach" is Manufactured and Canned.

BUHACH has been carefully experimented with and has received the unqualified endorsement of the most eminent scientists and entomologists in this country, among whom we quote: Prof. C. V. Illey; Prof. A. J. Cook; Prof. E. W. Hilgard, University of California; Prof. J. Henry Comstock; Prof. Matthew Cook, late Chief Horticultural Officer of California; Prof. W. A. Henry; Elbert S. Curman, Editor "Rural New-Yorker," New York; A. S. Fuller; Dr. F. M. Hexamer.

The Dreaded Rose-Bug, Impervious to Paris Green and all other Arsenical Compounds, gives up the ghost to **BUHACH**.

BUHACH POWDER will kill Rose-bugs. Last year it was blown upon them through bellows. This year we propose to use a Buhach extract, made by dissolving four ounces of the powder in a gill of alcohol and then adding one gallon of water, applied with force pump and "cyclone nozzle." We do know that Buhach will kill cabbage worms and the dreaded rose-bug.—*Rural New-Yorker*, April 25, 1885.

CABBAGE WORMS AND POTATO BEETLES. Prof. A. J. Cook says: I found Buhach efficient in destroying the Colorado potato beetles, the caterpillars of the cabbage butterfly and plant lice.

SLUGS, CATERPILLARS, GRUBS, ETC., ETC. I find it very fatal to slugs, caterpillars, grubs, flies, mosquitos, and both parasitic and plant lice.—A. J. Cook, *Entomological Laboratory, Agricultural College, Lansing, Mich.*

BUHACH, Safe and Sure Insecticide. I have been surprised by the effect produced on the hairy Tent-caterpillar by water containing the extract of 1 lb. of powder to 50 gals. They paid little attention to the bellows and powder, at least when the wind blew; but a sprinkle of the diluted ex-

tract promptly caused them to squirm, drop off, and finally die while attempting to crawl away.—E. W. Hilgard, *University of California*.

THE CURRANT WORM. Buhach, extended with plaster 50 times, kills the currant worm.—*Rural New-Yorker*.

DR. F. M. HEXAMER says: The efficacy of Buhach is so well known that its value as an insecticide is firmly established. We have lately experimented with it, and were highly pleased with the results. If properly applied it accomplishes all that is claimed for it, and has the great point in its favor that it is entirely harmless to human beings, as well as to house and farm animals.

MR. A. S. FULLER, Agricultural Editor "New York Sun," says: Some large climbing Roses that were badly infested with aphids and thrips were entirely cleared of their enemies by one dusting with **BUHACH**.

BUHACH is also an Absolute Specific for all insect pests of the household, such as Flies, Fleas, Mosquitos, Bed-bugs, Roaches, Water-bugs, Ants, Moths, Midges, Crickets, Spiders, Scorpions, etc., etc.

PRICE OF BUHACH.—25 cents, 50 cents, 75 cents and \$1.25, according to the size of cans. Insufflators, 25 cents each. Sent by mail, post-paid, on receipt of price. Buhach is sold by Druggists, Grocers, Florists and Seedsmen out of our 6 lb. cans at \$1 per pound, or \$4.50 per can of 6 lbs. Force Pump with ten feet of pipe and ten feet of rubber hose and one Cyclone spray nozzle, complete, ready for work, price \$9.00. Extra Cyclone nozzles, each 75 cents. Bellows with attachments for dry applications, \$2.00. Bellows with atomizer attachment for applying Buhach solution, \$2.00.

If Buhach is not on sale in your neighborhood, send your orders direct to us. Be sure you get "Buhach" and that the can is an original package. Many dealers will insist on your trying "something better" or "its good." Don't take it. Stand firm, and use nothing but "Buhach."

FOR INFANTS AND INVALIDS
RIDGE'S FOOD

USED FOR 25 YEARS AND STILL LEADS.

MORE CHILDREN HAVE BEEN SUCCESSFULLY REARED BY RIDGE'S FOOD THAN BY ALL OTHER FOODS COMBINED.

RIDGE'S FOOD for INFANTS and INVALIDS is without doubt the very best of the many foods now in the market. It is NOT A MEDICINE, but is a HIGHLY NUTRITIOUS and because a COOKED FOOD is easily assimilated, grateful to the most delicate and irritable stomach, and is especially adapted for the INFANT and GROWING CHILD. In cases of CHOLERA INFANTUM, DYSENTERY, CHRONIC DIARRHOEA and CHOLERA it is invaluable. It has received the most unqualified approval from physicians, matrons, and mothers of highest character and responsibility in this and other countries. INVALIDS, nursing mothers and those suffering from INDIGESTION will find on trial that RIDGE'S FOOD is all they can desire. Sold by druggists. Woolrich & Co. on label. A valuable pamphlet of "Healthful Hints," free for stamp; address Woolrich & Co., Palmer, Mass.

THE FLOWER MISSION.

With every year Flower Missions, the sweetest and loveliest of all charities, are extending their benign influences over the land.

The young lady teacher in a suburb of Boston little knew what a grand institution she was founding, what a glorious, immortal monument she was building for herself when she founded the Flower Mission, by giving a few flowers to the ragged, neglected children in the streets and asylums of her district. These few spontaneous gifts produced a demand for more than the young lady could supply herself, and so after consulting with some friends and soliciting their aid, which was cheerfully given, it was decided to have a notice read in the church, inviting contributions of flowers and fruits. When on the morning of the day appointed the church doors were opened, and the ladies stood ready to receive the gifts, there was no more mistaking that the chords of popular sympathy in this work had been

struck; and for all times to come, let us hope, they will continue to spread their sweet melodious sounds and soothing balm wherever there is suffering and sorrow.

"The first to come," says the record of the day, "were two bright-eyed girls, who, glowing with the air of their lovely country homes, and excitement from the thought of

then two more with baskets filled with English Violets; and again, another with field flowers. So far all were personal friends; the next contribution, however, was from a

stranger—lovely hot-house flowers and red, ripe Strawberries. Again, a silver-wedding gift of 12 beautiful bouquets, seeming to do the donors the pleasantest memorial they could have of their own happiness. Again a Lady Bountiful sends her carriage laden with cut flowers, pot-plants, and branches of flowering shrubs, placing the carriage also at the service of the ladies,—a welcome gift indeed, for it is no light task to carry the large, flower-laden baskets to their destination. Surely an auspicious beginning: contributions from 13 sources, distributions to 150 persons."

In New York it is about eight years since a Flower Mission was organized, and the amount of good it accomplishes is incalculable.

But it is not in large cities only that there is room for the tender ministry of flowers, in every village may be found sick and des

titute people to whom the gift of fresh fragrant flowers or a basket of fresh berries would often be a greater boon than bread or money. The bread is made sweeter by flowers.

GATHERING THE FLOWERS OF THE FIELD.

The Vegetable Garden.

SEASONABLE HINTS.

The ideal garden with rows upon rows of all the delicious vegetables of mid-summer, and not a weed anywhere, presents a charming view indeed. But, alas, how few of us have come near our ideals? Instead of choice vegetables, there are rank weeds, and where order and beauty should reign, desolation stares at us in too many family gardens, caused, in most cases, by simply having undertaken too much.

It is now a fitting season to consider how much more satisfactory and profitable it might have been to have planted only half or one-quarter of the area, and till it well, than to scatter the available labor over the entire ground, and do nothing to perfection.

Discouraging as a neglected garden appears, it is not beyond redemption, even at this late hour, if taken hold of at once. Stunted and failing crops, choked by weeds, had better be pulled out at once, weeds and all, and burned, and the ground plowed or spaded up, and re-planted.

Beans, Beets, Carrots, Corn, Cucumbers, Lettuce, Peas, Radishes, Turnips, Cabbage, Cauliflower, Celery, etc., may still be sown or planted, and under good treatment, will yield satisfactory crops.

Sweet Corn as a garden crop may be planted with profit, at any time, from the first of May till September. Wherever there is a strip of land for which one has no special use and does not know what to put into it, Sweet Corn may be planted to advantage. If there should be more than can be used fresh, it may be dried for winter, when it is sure to be appreciated. And if the ears should not mature sufficiently for use, the stalks make valuable fodder, or serve an excellent purpose for winter-mulching Spinach, Strawberries, etc. Plant some Sweet Corn every week!

Cucumbers require only five to six weeks from the planting of the seed till the first fruits become fit for use. Therefore seed planted early in July will generally produce a full crop. Ground from which early Peas have been removed affords an excellent place for a row of Cucumbers, and they succeed in drills as well as in hills. In either case some well-decomposed stable manure, or a good commercial "complete fertilizer" should be worked in along the rows.

This manuring in the hill, though all wrong, theoretically, works like a charm with Cucumbers, and so long as farmers can grow 200,000 pickles per acre in this way, they will probably continue to manure in the hill. With so rapidly growing plants as Cucumbers, an important object to be accomplished is to stimulate growth from the start as much as possible, so as to enable early cultivation. After the vines commence to run they will soon cover the ground so much as to make cultivation impossible.

The roots of the plants extend about as far, horizontally, as the vines do, forming a complete net-work below the surface, so that, even before the vines touch each other, the roots of one hill are feeding upon the manure in the other hills near at hand.

WHY SEEDS DO NOT GERMINATE.

We know that in every seed there is a latent germ, an embryo of a new life, which must be acted upon by natural influences before development can begin, and that when these influences do act, growth will follow. These natural influences are heat, moisture and air. All must set to work, and all must exist in sufficient quantity. If one is lacking, the others cannot make a seed grow. Hence, unless the seed is so defective that its growth is impossible, its failure is owing to the lack of one or more of these natural influences.

The lack of these influences is very frequently due to a mistake in covering the seeds. The seeds may be covered too deep or not deep enough; but the former is much the more likely to be the case. This is a hard matter to regulate; for soils vary in their power to take or to hold heat and moisture. Some soils will be heated to a depth of three inches more quickly than other soils will be heated to a depth of two inches. One kind of soil will dry to the depth of one inch as quickly as another soil will dry one-fourth of an inch. Hence we must consider the character of the soil, and plant differently if the soil is sandy or loamy, from what we would were it clayey.

I am of opinion that in two cases out of three the failure of seeds to germinate is owing to their being planted too deep. An experimenter sowed 125 Onion seeds each at the following depths: one-half, one, one and one-half, and two and one-half inches. The one-half inch depth gave 100 plants; one inch, 96 plants; one and one-half inches, 66 plants; and two and one-half inches, 12 plants. The soil was moistened during the experiment, else one inch depth would probably have given the best results.

Experiments with different soils, 25 seeds in each bed, gave results as follows: light sand, one inch deep, 23 plants; one-half inch deep, 20 plants; one and one-half inches deep, 10 plants; two and one-half inches deep, four plants. Clay soil, one-half inch deep, 23 plants; one inch, 21 plants; one and one-half inches, 16 plants; two and one-half inches, none. Mucky loam and black sand gave most plants at one-half inch depth. Sweet Corn covered one-half inch deep will germinate in 95 cases out of 100; covered five inches deep, will germinate in five cases out of a hundred; between these depths an inverse ratio of germination will be kept up—the more depth the fewer plants.

When the seeds are planted too deep they have not enough warmth, the heat of the sun not having penetrated to that depth; or they may lack moisture or air. Again, the plant will be exhausted before it reaches the surface. The bulk of the seed is plant food to nourish the plant, not only till it forms roots to suck up sustenance, but till its foliage expands above the ground, for it is only when the light acts upon its leaves that it can assimilate its food and change the mineral into the vegetable matter. It is this plant food which gives Peas, Beans, Wheat, Corn, Oats, etc., their value as food for man and beast. Now if the plant has too far to go to reach the surface, its food will be exhausted before its leaves get above ground, and it must die. This very frequently occurs in the field.

The shallower seeds can be planted, and have the necessary moisture and heat, the better they will germinate. But to have the necessary heat and moisture, it is necessary to have a certain amount of earth above them. Hence the advantage in compacting the earth above seeds; you lessen the distance the plant has to push upward to the light and also secure the necessary heat and moisture better. If the soil is placed loosely about the seed the necessary moisture and heat is lacking, because of the too free circulation of air about the seed, which dispels both moisture and heat.

Again, I have already stated that the plant cannot assimilate food until its foliage reaches the surface. But it should gather food from the soil before that time, that the roots and stem may be full of crude sap to be changed in the leaves at the earliest possible moment. The roots which feed the very young plant are exceedingly small, scarcely noticeable by the naked eye; and these roots must come in immediate contact with the moist, warm soil, or they cannot feed the plant, and the dry air will kill them. The way to bring them in immediate contact with the soil, is to bring the soil to them by pressing it about the seed. And when plants are thinned out, be careful to press the earth firmly down about those which remain.

It is a fact that all flat seeds germinate better when planted on edge, especially vine seeds, and where complete germination is very desirable it will pay to go to the trouble of putting the seeds on edge when planting them. JOHN M. STAHL.

SAWDUST ON POTATOES.

Somewhere I have seen it recommended that sawdust be put in the hill with Potatoes when planted, in order to keep the seed moist in a dry time. It will probably keep the seed moist, but it will do more; that I know from experience. It will make an excellent retreat for the white grub. Last season I examined a Potato field on a part of which sawdust had been used as above. On this section, there were white grubs almost beyond number, while on the other portion there were comparatively none. When a hill of Potatoes was thrown open with the fork, it seemed almost alive with the grubs; as the hired man said, "The patch is white with them," and it was true. In five hills apart from each other I found about 30 grubs. With this number and more in almost every hill in the sawdust section of the field, the ground would have appeared "white," indeed, could the contents of the hills have all been exposed at the same time.

Of course, it might not do to aver that the sawdust was the sole cause of the presence of the grubs, but there they were where the sawdust was, and, I might say, only there. At any rate I should quite as soon run the risk attendant upon dry weather, without the sawdust, as to take it with the sawdust and the grubs.

It may be further said, that the Potatoes in this field were very scabby, perhaps more so where the sawdust was not used. Whether the scab is caused by a parasitic, fungous growth or by the wire worm, in this instance nearly every Potato had one or more wire worms in the numerous and apparently fresh cavities in its surface. J. W. D.

ENDIVE.

This salad plant is comparatively little known except among the French and German population, yet its use is gradually increasing, in cities and large towns. The raising of this crop can be made profitable by those who will undertake the matter in a small way at first, work up a trade, and supply the demand which always exists. In proportion to the labor involved it is a profitable crop, as it can be added to the list of fall and winter salads in all gardens, with little trouble and expense.

The seed germinates easily and quickly in the warm weather of the last of July if the soil is damp, and transplanting may commence as soon as the plants have reached the four-leaved stage. I have not been able to notice that lifting the plants has done more than to retard their growth; the heads were as perfect and as large whether transplanted or not.

My practice is to sow in drills and then thin out to a proper distance, and set the thinnings. As the largest plants will make the best heads when grown, it is well to sow plenty of seed, and then use only the best among the plants. One ounce of seed will raise a thousand good heads. Endive needs warmth and moisture for growth, and cool, dry weather for bleaching. I usually make two plantings, in order to prolong the season. When the plants have made their full growth, and before they throw up the seed stalk, they are tied for bleaching.

The tying should continue till cold weather, and on approach of severe frost, all the plants should be tied up. When tied, Endive will resist severe cold, but if left exposed and open, freezing temperature will turn the inner leaves brown, which spoils its value, as the brown part cannot be eaten. Unbleached Endive is harsh and bitter. It is generally recommended to tie with bass bark, but I find white cotton cord to answer perfectly. Holding the leaves, with the heart of the plant in the center, firmly in the left hand, I make three passes around and tie. This holds it sufficiently in place, but if loosely tied the inner growth will force out at one side and remain unbleached. A week in hot weather is all that will be needed to fit them for eating, and in cool weather they will remain tied and edible several weeks. I have tried all the various methods of bleaching recommended, as covering with carpets, mats, shutters, shingles, flower-pots, etc., and have decided upon tying as the best plan.

When steady cold weather comes, the remainder of the crop is tied up, and the entire plants are lifted with all the earth that attaches to them, and carried into a light cellar where they can be kept dry and cool till wanted. I have kept Endive this way from six to eight weeks, up to New Year's.

I like the Green Curled variety the best. The White and Moss Curled are not hardy, are no better when bleached and do not grow as large. The Broad-leaved is not raised as well by the customers, therefore I raise only the Green Curled. It sells for 60 cents per dozen, and as it is easily raised, requiring little attention, except rich soil and enough moisture, the profits of the crop, where there is a good local market, are considerable.

W. H. BULL.

THE EGG PLANT.

Most of us are familiar with the fruit of the Egg Plant, though I have occasionally met a gray-headed man or woman who, in looking through our garden, inquired the name of this to them unknown plant. It certainly is not a very common vegetable in northern gardens, but with a few persons, the fruit in its season is considered a delicacy.

Being a native of the tropics, the Egg Plant is not certain to mature its fruits in the Northern States, unless given a sheltered situation, and started under glass. In favorable seasons, the earlier varieties will often ripen when started in the open ground, but stocky hot-bed plants that have been well

NEW YORK IMPROVED EGG-PLANT.

hardened off before planting out in the garden, are more reliable. The seed may be sown in the hot-bed, or in boxes in the house during the latter part of March. The young plants enjoy a high temperature, but when grown in the hot-bed, are likely to damp off unless given plenty of air. I find it a good plan to leave an occasional sash open an inch or two at the top, in all but severe weather, so long as the manure is in an act-

EXTRA EARLY DWARF PURPLE EGG-PLANT.

ive state of fermentation. On warm, sunny days more air should be given. If the plants come up thickly, it is well to prick them out when two or three inches high, in rows three inches apart each way, and to keep them as near the glass as possible, so that they will not grow up spindling. If that they will not grow up spindling. If especially fine plants are desired, it is well to pot them in small pots a few days before transplanting to the garden. They should of course be well watered after potting, and shaded for a day or two. In ordinary seasons, little will be gained by planting out in the garden in the Northern States before the first of June. The transplanting should

be done, if possible, just before a rain sets in. The young plants find an enemy awaiting them in the garden. The Egg Plant is closely allied to the Potato, and the voracious Colorado beetle is anxious for a breakfast from its tender leaves. Paris Green must be resorted to when this pest is abundant, or it will soon make havoc with the young plants. Later, after the plants secure a start, they are better able to take care of themselves. Fortunately this is the only insect with which it has to contend. The only culture required is to keep the surface soil mellow. By the last of August or the first of September the fruits should be ready for use on the table or for market.

The most popular variety among market gardeners is the New York Improved. This yields very large, deep purple fruits, which in spite of their large size, are often entirely concealed by the very vigorous foliage.

The earliest variety and one of the best for garden culture, is the Extra Early Dwarf Purple. This yields numerous small fruits of a dull, blackish-purple color, which ripen ten days or two weeks earlier than the New York Improved.

Other varieties yield almost pure white fruits, some of which have a very striking resemblance to a goose egg. Plants of this variety with their fruit have attracted much attention in our garden. Another variety bears fruit of a rich scarlet color, and still another has fruit striped with yellow and purple. With the exception of the first two, none of these are considered valuable for the table. "ELM."

FRESH SPROUTS.

The most successful Asparagus growers of Long Island, plant the roots four feet apart each way.

Sprinkling the plants with a decoction of Tobacco-stems and soft-soap, followed by a dusting of lime, is recommended by P. T. Quinn as an effective preventive for the flea-beetle so destructive in many gardens.

A machine for shelling Peas has recently been invented in Europe, which is said to be a perfect success, doing as much work as several hundred women in the same length of time.

In the experiments made with Potatoes at the Ohio Experiment Station, the varieties first to ripen were Clark, Early Harvest, and Early Ohio; Vanguard, Pearl of Savoy, Early Gem, and Beauty of Hebron ripened five days later.

An abundance of green foliage of Asparagus during the summer is necessary, if we would have luxuriant sprouts next spring, and to produce this end nothing is more effective than to give the rows a heavy coat of manure as soon as cutting is discontinued.

Prof. W. R. Lazenby thinks that with Potatoes as well as with many other vegetables, the list of varieties has become so inflated as to baffle all attempts at accurate description. The only remedy for this is to group the several varieties resembling each other in their most prominent characteristics into a class, and give them one general description.

The Fruit Garden.

SEASONABLE HINTS.

Whatever differences of opinion may exist in regard to the merits or demerits of cultivating Strawberries during spring, there are certainly none as to the necessity of giving them a thorough cleaning after bearing, and to keep them well cultivated during the remainder of summer.

Old Strawberry Beds.—The sooner after bearing they are attended to the better, and in many, if not most cases, the most suitable attention to give them will be to spade them under and plant new ones. To weed and cultivate an old, neglected Strawberry bed is a thankless task, and much more laborious than the preparing and planting of a new one. Although some varieties will continue to bear for four and five years, it proves seldom profitable to take off more than two crops from the same plants.

New Beds, where the young plants are grown on the place, can be made during summer as successfully as at any time. In small gardens, and in larger ones too, sometimes, the difficulty presents itself that the entire ground has been planted earlier in the season, and now, when a new Strawberry bed is contemplated, no available place can be found for it. This difficulty may be avoided, however, by renewing one-half of the plants every year. While, on general principles, it is preferable to plant on ground that has been devoted to some other crop, and when such is possible it may be better to do so, it is nevertheless a fact, that in some soils Strawberries may be grown on the same ground for many years, if liberal manuring is given. We know beds that have been in Strawberries for ten years, and the crops are as bountiful now as ever.

In one instance there are twelve rows, two feet apart, and the plants in the rows one foot apart. One-half are renewed every year. The plants set out two years ago are spaded under immediately after bearing, incorporating at the same time a heavy dressing of composted manure. The ground is raked over occasionally, so as to kill every weed as soon as it germinates.

The remaining six rows, which were planted one year ago, are hoed and cleaned, and all runners removed except one or two of the strongest from each plant, which are layered in the loose soil. So soon as the young plants are large enough, they are taken up on a damp or cloudy day and carefully transferred to the new bed without disturbing their roots. The plants do not seem to notice the removal at all, they keep growing on uninterruptedly, and hardly one in a hundred is lost. They will bear a very good crop next season, and a still better one in two years, while next summer they furnish young plants for the other half of the bed to be renewed in the same manner.

This plan may not prove satisfactory on some soils, in fact we know it does not succeed everywhere, but having the above observation before us, we would surely prefer to replant without rotation of ground, than not to plant at all, and run the risk of going without Strawberries.

CULTIVATING STRAWBERRIES.

Too many owners of Strawberry beds, unfortunately, will not require to be cautioned against avoiding cultivation at any time of the year, yet as spring cultivation has been strongly recommended recently, I wish to state that my experience does not favor this plan, and leads me to the conclusion that during the fruiting season, or from the time the plants blossom until the juicy crop is harvested, it is not safe to stir the soil to any considerable depth. The reason for this is obvious. The plants are putting forth every effort to produce fruit to their full capacity, and if the roots are injured at this time, especially when the soil is dry, it is sure to check the growth and consequently diminish the fruit crop.

A case in point is that of an elderly friend of mine, now deceased, who a few years ago, having retired from active labors in the ministry, developed an innate taste for gardening in a well-cared-for little Strawberry bed containing a few plants each of the choicest varieties. This patch of Strawberries was really a pet of the good old gentleman.

The first time it furnished a supply of fruit it was presented in payment with a liberal dressing of fine compost, lightly worked in between the rows. Unluckily this contained a quantity of vile weed seed which had escaped decay. This was a source of trouble during the remainder of that season. The following spring a light hoeing was given soon after the winter mulch was removed, but during the blossoming season the weeds came up thickly. The ill health of the owner prevented his personal attention to the matter, so a neighbor, with more good will than knowledge of Strawberry culture, gave the whole bed a deep stirring with a prong-hoe, undoubtedly complimenting himself on the thoroughness of his work.

The result, I regret to say, was a failure of the crop and a lasting injury to the bed, much to the disappointment of the owner. The experience, however, proved a practical lesson to both himself and to the neighbor.

W. H. RAND.

FRUIT GROWING IN FLORIDA.

A northern correspondent of THE AMERICAN GARDEN, writes me as follows: "My health demands I should seek a milder climate, and my attention has been drawn towards Florida. Could I not make more than a living at small fruit growing there, Strawberries, principally? I see frequent mention in the papers of the large quantities of berries sent North from that State."

Yes, the papers frequently teem with such items as the following, which I noticed in a Florida paper to-day. "An Ocala fruit grower picked and shipped in two days last week, 700 quarts of Strawberries from three-sevenths of an acre of ground."

This reads nicely and makes visions of wealth and profit loom up in the distance. It would amount to 1633 quarts or 51 bushels per acre in two days, and we would naturally suppose two or three pickings had preceded or would succeed it, which would swell the story still more. If the paragraphist had only added the net cash receipts to the item, it might have given it a little more luster, and have been more business-like. I am free to say that the only instance I

have seen that looked at all like a promising success in Florida Strawberry culture was near Ocala, the owner having then about ten acres in bearing, from which he expected or hoped to pick 20,000 quarts. If the statement quoted refers to him and is true, his expectations, which to me appeared rather high, would seem about to be realized from only a portion of the crop. His first picking was made Feb. 2d, and consisted of 13 quarts. Now could his or any other Strawberry bed in that locality have held out two months, and given such a yield as quoted above? The idea seems preposterous, and due reflection induces me to regard this and similar statements as vain exaggerations, the results of inordinate State pride, and should be taken with a good deal of allowance.

Florida is a large State, 400 miles long. I have been over but a small portion, comparatively, but with the single exception above mentioned, I have seen no flattering attempts at Strawberry culture. Here on Indian River, latitude 28°, 250 miles south of Jacksonville, every attempt to grow them, that I have heard of, has proved an entire failure. The failure is attributed to the long, dry summers, by those who have experimented. I think on moister land contiguous to fresh water, in more northern parts of the State, where "malaria is a foot thick," as a gentleman expressed it to me a few days since, when canvassing this very subject, locations abound where Strawberries will do fairly well, and I hope repeated trials and experiments will demonstrate that they can be grown by irrigation, mulching, shading, etc., in localities naturally unfavorable to them, but I do not believe that with our present varieties, Strawberry culture in Florida will ever approach the perfection attained in our Northern States. The climate and other conditions are so changed here, that it requires time and experiment for both plants and planter to become accustomed and adapted to the changed conditions, so as to know how to behave.

I fear the person who expects or attempts to make a competence at growing Strawberries in Florida, will very soon retire in disgust, and try other fields and pastures new.

E. WILLIAMS.

DRYING AND BLEACHING APRICOTS.

The Riverside Press and Horticulturist says: The fruit when ripe is picked, cut in halves, the pits are removed, and the pieces are placed round side down on ordinary trays, such as are used in the drying of Raisins.

When these trays are filled with fruit they are stacked up in one room of the fumigating house, one tray being put on top of the other. The room can be made as full of trays as convenience in handling would dictate. The sulphur is then burned in the center of the room and the door is closed. From 20 minutes to half an hour is sufficient to fumigate the room full of fruit if the smoke is made dense, which is easily done. At the expiration of this time the door is opened and the wind soon clears the room of smoke, when the trays are removed to the drying ground.

After the fruit is sufficiently sun-dried it is placed in a fruit-drier, where the temperature is put up high enough to kill any insects or eggs that may have lodged on the fruit during its drying.

THE JUNE-BERRY.

Amelanchier Canadensis.

While progress in the improvement of some of our native fruits has been rapid and surprising, it seems strange that other kinds have been entirely ignored. Among these is the June-berry, also known as Service-berry and Shadbush, a widely distributed shrub or small tree. It is found almost everywhere throughout the woods of the United States, and, bearing its pure white flowers in large terminal racemes, early in spring when trees are yet bare of leaves, it forms a most conspicuous as well as attractive object of the forests. The species varies exceedingly, so much so that its many forms have been divided into five distinct varieties: *Botryophyllum*, *oblongifolia*, *rotundifolia*, *almifolia*, and *oligocarpa*.

The fruit, which ripens in June, is berry-like, roundish, purplish when ripe, sweet or slightly sub-acid, and pleasant to the taste. With these good qualities to start upon, there seems to be no reason why the June-berry should not be as amenable to improvement as other members of the Rose Family.

BLOSSOMS AND BEES.

The true meaning of flowers was not understood by anyone a hundred years ago. Their bright colors had attracted the eye, but they did not lead to any deep insight until Sprengel began his famous investigations upon floral organs that resulted in a book,—"The Secret of Nature in the Form and Fertilization of Flowers Discovered." In this book we learn that the important work of the flowers in the economy of the plant, was to aid in producing seed. More than this, it was

seen that the various species of plants had provided means for the fertilization of the young seeds, with dust from some other flower than its own.

The bright colors, the fragrant odor and the sweet nectar, are all designed to help on this work of cross-fertilization. Sprengel remarked of the Cranesbill, for example, that "the nectar of these flowers is secreted for the sake of insects, and it is protected from rain in order that the insects may get it pure and unspoiled." No generous spirit induces the plant to provide nectar for the insect tribes, and attract them to the feast

by a display of bright colors. It has learned from the experience of its ancestors through an extended line of generations, that it is cheaper in the long run to develop the sweet and the showy parts, than to run the risk of degeneracy and final death of the species through close inbreeding.

This whole subject of close and cross fertilization of flowers, has engaged the attention of the best observers within the present century, and the truths by them established are beginning to enter the minds of the people generally. There is great pleasure in seeing this diffusion of a knowledge so new

duce. Select a sort with good stamens and replace the old bed with this, or let the new ones be placed in alternate rows.

In many ways the fruit grower may advance his interests by a knowledge of the functions of flowers. Besides all this, there is the unmeasured satisfaction of knowing. The methods by which plants secure cross-fertilization are various, and some of the books upon the subject are both large and very interesting. If this brief mention of the great subject will induce a dozen gardeners and fruit growers to carefully read Darwin's "Cross and Self-Fertilization in the Vegetable Kingdom," and Muller's "Fertilization of Flowers," it will have secured its purpose. I have no more personal interest in these works than in any others that will do an equal amount of good. Here is a fund of practical and valuable information that all readers of THE AMERICAN GARDEN should know about.

BYRON D. HALSTED.

SHORT CUTTINGS.

Prof. Budd thinks that the idea that the Russian Apricot will take the place of the Peach is the sheerest nonsense.

Long experience, says E. P. Roe, has taught me that profit in growing small fruits for market lies in the direction of quality, not quantity.

Dried Orange peel is a more important article than is generally supposed. The quantity imported into New York annually is valued at \$12,000.

In the Rural New Yorker Grape election, the largest number of votes for the best black varieties was given to Coucord

and Wordeu; red, Brighton and Delaware; white, Niagara and Lady.

Scale on Orange-trees can be completely removed, it is stated, by mixing 20 pounds of lime with one gallon of petroleum; then add 100 gallons of water and spray the trees. One application is said to be sufficient.

After twenty-five years' trial of the Wilson in comparison with all the highly praised Strawberries S. M. Smith, President of the Wisconsin Horticultural Society, places it first on the list of profitable market berries,

THE JUNE-BERRY.

that the series of observations that developed the truth may not have yet terminated.

Cross-fertilization of flowers, that is, the fertilization of the young seeds of one flower by the pollen of some other flower, is now considered as the method by which strong, vigorous seeds are produced. Darwin, who has been the foremost student in this field, expresses his convictions thus: "Nature abhors continuous close-fertilization." Gardeners sometimes have serious trouble with some fruit-plants. Their Strawberry bed, for example, may not be productive. The fault may lie in the imperfect stamens the flowers pro-

The Flower Garden.

WATER-LILIES.

I muso alone, as the twilight falls
Over the gray old castle walls,
Whoro a sleepy lake through the lazy hours
Crisply mirrors the time-worn towers;
And scarce a whisper rustles the sedge,
Or a ripple lisps to the water's edge,
As far and wide on the tideless stream
The matted Water-lilies dream.

I stood, in the quiet over' fall,
Where, in the ancient banquet hall
Over the hearth, is a panel placed,
By some old Florentine chisel chasad,
Showing a slender, graceful child,
In the flowing robes of a wood-nymph wild,
Bending over the wavy flood
As she stoops to gather a Lily bud.

In words as quaint as the carving old,
An aged dame the story told,
How an Earl's daughter, long ago,
A strange, pale child, with a brow of snow,
Had loved, and lost her life, for the sake
Of the Lilies that grew in her father's lake,
Holding them ever her favorite flower;
Till once, in the hush of a twilight hour,
Floating among them, out in the stream,
Where the passionless blossoms nod and dream
They found her lying, white and dead,
"Like a sister Lily," the old dame said.

And a sadness, born of the old-world tale,
Haunts me still, while the starlight pale
Gleams on the leaves, so green and wet
Where the changeless Lilies are floating yet,
And a message I fain would read aright,
Seems to lurk in each chalice white,
A secret, guarded fold on fold,
As it guards its own deep heart of gold,
And only told to the listening ear
Of him who humbly tries to hear.

Oh! mystic blossom floating there,
Thing of the water, thing of the air,
We claim thee still, as we hold the dead,
Anchored to earth by a golden thread.

—Good Words.

SEASONABLE HINTS.

The beautiful group of *Lilium auratum*, represented on the opposite page will, no doubt, recall to the mind of some of our readers, their successful attempts in growing this "Queen of Lilies." Having ourselves grown many thousands during twenty years, both successfully and otherwise, we are fully aware that, even under apparently most favorable conditions, this capricious Lily will sometimes fail to fulfil expectations.

A deep, light, and well-drained soil, and before all a situation where water will not stand at the surface for any length of time, are considered indispensable for its successful cultivation, and yet we have them now growing splendidly under directly opposite conditions.

Three years ago we planted about two dozen bulbs in what seemed then a most unpromising spot, a heavy, wet, clay soil, on which water stands not unfrequently. Here they have been growing stronger from year to year, and stand now in full vigor and beauty. All the care they had was a covering of forest leaves during winter, and one or two hoeings in summer.

From this we do not wish our readers to infer that we advise the planting of Lilies in heavy clay. We simply relate this incident to show the value of observation and experimentation, and the benefit that may sometimes be derived by cutting loose from old routines and precepts.

SOME GOOD PERENNIALS.

JAPAN SPIRÆA.

How hard it is to make the correct name of a plant popular, after it has once come into common culture under a wrong one, is especially the case with the plant under consideration. It was brought into cultivation under the name of *Spiræa Japonica*, having been introduced from Japan. Then we were told that it was not *Spiræa* but *Astilbe*. This was shown to be wrong in that it differs from *Astilbe*, which is apetalous in its flowers. While this controversy was going on in florists' catalogues, it was discovered that the plant had been named and described long ago by Siebold as *Hoteia barbata*. The name *Hoteia* was given it in honor of Ho-tei, a Japanese botanist who was the author of a work called *Sov-Kwa-S'jua*, which includes descriptions of more than 350 plants, natives of China and Japan. This work was accompanied by 80 plates, designed by M. Siebold. The specific name *barbata* is better than *Japonica*, as the plant is a native of various parts of India as well as Japan. The erroneous name of *Spiræa Japonica* is now so commonly applied to this plant that it has taken the place of any English name, and will answer all purposes, except when it is necessary to be botanically accurate.

I started out to say that this plant now so commonly used for forcing in the spring, is an admirable herbaceous border plant, where the ground is inclined to be moist and slightly shady. It is not satisfactory with us in a dry location and full sun.

PERENNIAL CANDYTUFF.

This hardy border plant, botanically *Iberis sempervirens*, I noticed in fine bloom this spring at the Agricultural Department grounds at Washington. A mass of its snow-white flowers in front of some dark evergreens was very effective. Another species, *Iberis Gibraltarica*, is equally good, but not so hardy with us.

PEONIES.

I also noticed at the Agricultural Department a large collection of Peonies, but none were then in bloom except a bright crimson, single-flowered one with finely lacinated foliage, *Pæonia Russi*. I advise all lovers of Peonies to get this bright, early-blooming species, as it is well worth growing for its pretty foliage alone. It is not a new kind though not common. A plate of it may be found in Vol. 62, Botanical Magazine for 1840. It may be under some other name now at Washington.

SPREADING SAGE.

Another herbaceous plant, but not hardy, is rarely seen in perfection, though no plant in cultivation can equal its rich shade of blue. This is the *Salvia patens*, or spreading Sage. It blooms readily the first season from seed, but to have it in full beauty it should be cut down, lifted and potted in autumn, and kept nearly dry during the winter. A large plant of *Salvia patens* is well worth all the room it requires. I find that it varies somewhat from seed, some plants being much higher colored than others. Only the best should be kept.

ANEMONES.

Why is it that the varieties of *Anemone vitifolia* are not more popular? We seldom see these in perfection. Is it not because in our hot and dry climate we give them too sunny an exposure? Dr. Wallich says, "It

is one of the commonest as well as most ornamental flower-plants of Nepal, where it grows in all the forests of the great valley, and the surrounding mountains, delighting in shady, retired and moist situations in the vicinity of rills and torrents." It is also found in the moist valleys of the Himalayas. And yet our gardeners expose a plant from such situations to the full sun in our arid climate. To those who have never seen these Anemones under favorable conditions, they will prove very attractive when thus grown; though they do quite well under ordinary culture. A number of improved varieties have been raised in garden culture, which are superior to the original species.

But of all hardy, herbaceous scarlet flowers, I know of none that surpass in effectiveness the Scarlet Anemones. An old Eastern Shore garden with a large bed of double scarlet Anemones, is one of the bright memories of youth, which I have often tried to imitate with indifferent success. They are too tender near Baltimore, but when they do well nothing can exceed the brilliancy of their color in masses. In cold frames I have always had the best success, both with these and the Persian Ranunculus.

PERENNIAL LARKSPURS.

I have an old friend whose passion is for hardy, herbaceous plants, and he has almost every kind worth growing. I take a great deal of pleasure in looking over his borders when in bloom. The contrasts of color are sometimes startling when a great, flaunting, scarlet and black Poppy stands beside a spike of *Delphinium formosum*. And this reminds me to say that no flower has of late years been more improved than the different varieties of perennial Delphiniums. The best strain of *D. formosum* which I have ever grown is *Delphinium bicolor grandiflorum*. At one of the exhibitions of our Maryland Horticultural Society last year, the old friend above alluded to, exhibited a spike covered with blue flowers, each one of which was about the size and shape of good, double Daisies. I was utterly at a loss what to call it until our friend produced a leaf which showed it to be a Delphinium. He had received it from Belgium as the latest triumph in improved Delphiniums. It was beautiful but too much "improved." I much prefer the brilliant, single-flowered sorts. And allow me to say that the big scarlet Poppies are well worth growing. WM. F. MASSEY.

THE SWAN RIVER DAISY.

Blue flowers are usually scarcer than other colors. Australia abounds in blue flowers and has contributed many good plants to our gardens. Among the best of these is the little Swan River Daisy, *Brachycome iberidifolia*. This is a dwarf and free-flowering annual. Its flowers resemble the *Bellis integrifolia* or American Daisy. It succeeds finely as a dwarf edging plant. The color is usually bright blue, but it sometimes varies through purple to a pale pink. All who want a neat, dwarf, blue "Daisy" we advise to try the *Brachycome*.

HAVING A THOROUGH GARDENER.

"Yes," said a huly of refined taste, "the place is elegant, but there is no love in it; it seems as though the family have no real love for any one plant, shrub or bed. They must have a thorough gardener."

MIGNONETTE.

Reseda odorata.

Everyone knows, I presume, that the Sweet Mignonette thrives in the early autumn months, thus showing that it requires a cool, moist atmosphere. To have it succeed best it should be grown in a deep, moderately-enriched, loamy soil, dug to the depth of two feet, and at the same time thoroughly incorporating a good portion of well-decayed manure.

All preparatory work should be done as early in the season as possible, so that the ground becomes well settled before the seeds are sown; if this is not feasible, then firm

placed in gentle heat in a moist situation, as close to the glass as possible, and as soon as the young plants are strong enough to handle, they should be carefully removed into two or three inch pots filled with rich, loamy soil; place one plant in each pot and keep all close and moist until they commence to grow, then place them in a cooler, airy situation, and when the weather becomes warm and settled transplant outside.

For late flowering, the seed should be sown where the plants are to bloom, about the middle of July. Cover the seed to the depth of an inch, and firm the earth thoroughly around it. By so doing the seed will

latter, I prefer the Prize Taker and Parson's White. This year the Midget and Large White Upright are listed among the latest and highly praised novelties. Any of these new or old varieties, if properly cared for, will surely give satisfaction.

CHAS. E. PARNELL.

OUR FLOWER BASKET.

The White Cottage Rose, difficult to raise from cuttings, is easily propagated by layers.

Verbenas to do their best must have rich soil and a sunny position, have the branches pegged down and all fading flowers cut off.

GROUP OF LILIUM AURATUM.

the ground as thoroughly as possible and finish by leveling it neatly. Now mark it out into rows about ten inches apart each way, and at each intersection scatter a few seeds, covering them slightly, and as soon as the young plants are strong enough to handle, remove all but one of the most promising. This sowing, which should be made about the first of May, will give a profusion of bloom during the greater portion of the summer months, and, where only one sowing is made, is the most useful.

For earlier flowering, the seed should be sown in a well-drained pot or pan of light, loamy soil about the first of March, and

germinate quickly, while it will certainly fail if sown carelessly. Treat the plants precisely as advised for the main sowings, and from the first of September there will be an abundance of bloom until the plants are destroyed by frost. If some of these plants are so situated that a cold frame can be placed over them, and it is well protected on cold nights by means of mats or shutters, the supply of flowers will be continued for a much longer period.

Recently this old favorite has given us some very distinct and desirable varieties, the Golden Queen and Hybrid Spiral being quite an advance on the older sorts. Of the

Petunias trained on stakes are more effective than trained in any other way. Three or four should be planted around a short stake to which they are tied as they grow taller, and when of sufficient size, allowed to droop over, all around.

Not less than two millions flowering plants are probably sold in New York every spring. These retail from 10 cents to \$1 each, averaging perhaps 25 cents, and making a grand total of half a million dollars which the city and its suburbs devote annually to the embellishment of their gardens and windows. This does of course not include cut flowers.

The Window Garden AND GREENHOUSE.

THE WINDOW GARDEN FOR JULY.

During the summer months we do not mean to keep plants in our windows; it is better for our rooms, and the plants too, that the latter be outside in some suitable place. Those who have greenhouses may make an effort at display even in summer, and this is usually done by the use of Ferns, Crotons, Dracenas, Palms, colored-leaved Caladiums and other plants that dislike full sunshine or are permanently planted out in the greenhouse.

In the out-door summer treatment of window or greenhouse plants the care and cultivation are about the same,—we aim to have healthy, vigorous, stocky plants, well rooted and matured enough to assure an abundance of flowers in winter or spring.

The usual routine of watering, cleaning, shortening, staking, tying, preventing over crowding, and the like, requires vigilant attention.

In order to change matters a little, I will tell you how my own stock is "fixed" for the summer; did I know how better to treat it, I would do so:

CALLAS

Were shaken out of their pots and planted singly, some in open, sunny, and others in somewhat shady ground. I won't water them in summer. In August or September I'll lift and repot them.

CARNATIONS

Are planted out and mulched. What flower-spikes they bear are pinched out, but I don't pinch Hinz's White after June.

LADY WASHINGTON GERANIUMS

That have done blooming are turned out of their pots, and planted in a half shady place. I give them no water. The young growth they make a little later makes capital cuttings which make fine blooming plants for next spring. If I shall want them I'll lift and repot some of the old plants in fall.

ZONAL GERANIUMS

Are in four-inch pots and plunged in frame; they were "struck" in April. I shall soon shift them into five or six-inch pots, which are large enough for winter use. Keep the plants quiet, don't encourage growth, but instead, ripe, stocky wood; don't over-water nor feed with stimulants. Doubles are better than singles as cut flowers.

VIOLETS

Are young stock planted out in rows in beds and mulched. I give them water occasionally and keep the runners cut away.

BOUVARDIAS,

Old and young, are planted out and mulched; they were cut well back before they were set out, but now are growing freely and cut in to keep them bushy. They bloom well in summer if permitted, but I want them for winter work, hence won't let them have unrestricted freedom before September.

EASTER LILIES

Are growing in pots, plunged out-of-doors and unheeded except to keep them clean from weeds. In the case of *Lilium longiflorum* particularly, I get finer results from bulbs grown year after year in pots and top-dressed but not repotted every year, than I

do from good bulbs grown in the ordinary way out-of-doors and potted in fall.

STEVIAS, PARIS DAISIES AND HELIOTROPES Are in pots plunged out-of-doors. When planted out they grow too much. Pinch them freely and give them plenty of water and plenty of room.

POINSETTIAS.

The old plants were cut hard back, and when they had started a little were turned out of their pots, the old soil all shaken away, and the plants repotted into as small pots as we could get the roots into. They are growing nicely and plunged out-of-doors in a sunny place. Plants from cuttings put in two months ago are well rooted, in small pots, and plunged in a frame.

CHINESE PRIMROSES.

Some are in two-and-a-half, three, and four-inch pots, in a cool frame and shaded from strong sunshine. Repot as soon as the roots show a tendency to become root-bound. Seeds sown now should yield blooms for next winter or spring.

NASTURTIUMS

Are now acting as Peas in covering brush. About the end of this month I shall strike some for flowering in winter. The varieties of *Tropaeolum Lobbianum* are best. Feed them liberally if you desire to get large, fine flowers.

BEGONIAS.

Tuberous-rooted kinds are planted out in a slightly shaded spot, and some with Gloxinias in a frame; the Rex section are in the greenhouse, also plunged out-of-doors in the shade; the big-leaved ones like *B. heraclifolia* are planted out in a shady place but not under trees; and the many fine-flowering, tall-growing kinds like *B. fuchsoides* are plunged in an open bed.

AMARYLLISES

That had done blooming are plunged in a cold frame and have a screen of laths laid over them.

CRINUMS.

Of the Caribbean one I have a good many bulbs and planted them out in a cold-frame; they are now in bloom and very pretty.

FUCHSIAS

Are treated almost in the same way as we do Lady Washington Geraniums. My best blooms now are on March-struck plants. If you want a big flower get Phenomenal.

GLOXINIAS

Are planted out in frames, growing freely and beginning to blossom. Seedlings raised last March will bloom in August and September; if I had had room to grow them along unchecked I could have some of them in bloom now. I have had old plants in bloom in pots for some months past. Shade them, water them sparingly and don't wet their leaves, else you may induce "rust."

ROSES.

Young stock are planted out. In this way I get a far better growth in them than I can by keeping them in pots, and they are less subjected to mildew. In early fall I shall lift and pot them and get them well rooted in their pots before winter sets in.

CHRYSANTHEMUMS

Are growing fast. Don't pinch them much more else you may make them late. Give them lots of water and liquid manure, stake them firmly and destroy aphides. With a sharp spade cut around the roots of those you intend to lift and pot in the fall,

MAHERNIA ODORATA

Has sweet little yellow flowers in winter and spring. When planted out it grows beautifully, but it is hard to lift, therefore, I advise you to grow it along in pots.

BROWALLIA JAMESONI

Has become very popular since a year or or two. Planted out or grown in pots it is equally serviceable. It bears immense bunches of orange flowers in late winter and spring.

LEMON VERBENAS

Belong to that class of plants, as Fuchsias, Crape Myrtles, and the like, can be wintered safely in the cellar, therefore I prefer to plant it out in summer for summer use only.

CALCEOLARIAS AND CINERARIAS.

I shall sow some of these now, also another sowing in August and one in September. They need a cool, shady place to grow in, and should never know what thirst means. A cold-frame on the north side of a building is a good place for them. Slugs are fond of them, green fly infests them, and I have been so much annoyed by crickets eating them that I have had to raise the little frame containing them off the ground as if on a table, or use mosquito-wire-netting as a covering to the plants.

STOCKS.

Sow some of the biennial sorts as Intermediate, Brompton, East Lothian or Emperor, and grow them along in pots. They will yield you next spring, for out-door or in-door use, a large amount of flowers. A well-wrapped cold-frame is all the winter quarters that they need.

SWEET ALYSSUM.

I would advise you to get some plants of the strong-growing, double-flowering sort, and grow it along vigorously in pots and in an open situation, so that you shall have strong plants for work. Then give it a place near the light and lots to drink and you will have blossoms as long as the snow lasts.

LIBONIAS

Are copious winter-bloomers. Mine are planted out. I shall lift and repot them next September.

CYCLAMENS.

Old plants were turned out of their pots and planted very closely in a cold-frame, burying the corners about an inch or thereabout. I don't give them any water. As soon as they start into fresh growth I shall lift, repot, and again return them to the frame, but plunged. The seedlings I raised last spring I have potted off singly and am growing them on unchecked.

WM. FALCONER.

FERNS FOR A HALL.

Nothing is prettier in a front hall than brackets of living plants; and nothing else will give so distinctive an air of friendliness and welcome. The plants may be grown in pots, set in handsome pot covers, and supported by elegant bronze brackets; or, if this seems too expensive, simple wooden brackets, carved or staked, and corner shelves are also enough for anyone. If plants of a drooping habit are used they will soon hide the pot, so the costly pot covers are not essentials. But the heart of the whole affair is in the plants chosen. They must be plants with persistent foliage, and which thrive well in a cool and somewhat dark room. Then success will come.

THE PARIS DAISY.

Chrysanthemum frutescens.

Last spring a florist sent me one of the new Paris Daisies, or Murguerites. I potted it in ordinary garden soil, and it soon began to grow. Soon buds made their appearance among the pretty foliage. At first, these buds were well down among the leaves, but as they developed, their stems elongated rapidly, so that when they came into bloom, the flowers were borne well above the foliage. The flowers were single, a ray of white, narrow petals about a yellow disc,—a somewhat enlarged field Daisy, no more, no less.

But it must not be inferred from this that I was not pleased with the plant. On the contrary, nothing in the line of new flowers that was sent me last spring afforded me as much pleasure. Notwithstanding it is "only a weed," our well-known Daisy is a really beautiful flower, and any species of it which can be grown in the house is a decided acquisition to the lover of modest flowers. The plant grew well and was in bloom all summer. It continued to bloom all through the winter, and was greatly admired. It was very useful in furnishing cut flowers for small bouquets.

This spring it has been literally covered with bloom. The plant has grown to a height of nearly three feet, is compact and bushy, and would be well worth growing on account of its fine, profuse foliage, which makes an admirable background for bright flowers. No insect has ever attacked it. It is as easily managed as a Geranium. If any one wants a pretty, clean, bright-looking plant, they can scarcely do better than to get one of these beauties. E. E. REXFORD.

FLOWER-POTS.

The relative value of hard-burned and soft or porous flower-pots, so far as the culture of plants is concerned, is a subject of occasional inquiry. Hard-burned pots are not generally esteemed, says Superintendent Wm. Saunders, and many persons consider them unfit for the best results of plant-culture, while others find no objection to them, and use indiscriminately glazed pots or even slate tubs, when they can be procured. The only difference seems to be that the porous pot requires more water than will be found necessary in the case of hard-burned pots or slate tubs.

Porous pots will part with much water by evaporation from their sides, especially when exposed to the sun or a dry atmosphere. In a dry atmosphere the hard, close-grained pot will retain more moisture in the soil. Plants, therefore, require water less frequently in the hard pots; and in the ordinary greenhouse where a considerable amount of humidity generally prevails, special care will be required in order that water is not given in excess. The same amount of water applied to plants of similar size and vigor, some of which are in hard and others in soft pots, will speedily show unhealthiness in those in the hard pots. It is perfectly practicable to grow plants equally well either in soft or in hard pots, but the details of management are different, and to those who are not experts in plant culture, the porous pot will be most suitable.

OLEODENDRONS.

Among the many beautiful plants at our exhibitions, none are surer to attract the admiration of visitors than well-grown specimens of Clerodendron, and it is with much truth that Peter Henderson says: "It is difficult to conceive more beautiful objects than several members of this genus when well cultivated."

Cuttings taken off any time during summer, root readily, or in winter in gentle heat, and should be kept in small pots through the succeeding winter, on a shelf or underneath a bench in the greenhouse. About the first of February repot them, giving them a liberal shift. The soil should be light and very rich. To flower freely they require frequent shiftings from smaller into larger pots. With this treatment they can be made to bloom continually during the entire season.

Old plants can be grown on with occasional shiftings, and make splendid plants for garden decoration during summer. They must, however, be grown in the shade. Af-

CLERODENDRON BALFOURII.

ter flowering water freely, in order that they may make a good growth, after which they should have partial sun to ripen the wood. If not wanted for winter flowering, remove the plants in the fall to a light cellar free from frost, giving them during winter just enough water to sustain life. In the spring when all danger from frost is over, remove the plants to any desired position in the garden or on the veranda for another season of bloom.

Clerodendron Balfourii is the best and most showy species, and one we have seen in full bloom a number of years in succession, with the above treatment. It makes a valuable climbing plant when so desired.

It is a good plan to put a layer of moss over the drainage in large pots to prevent the soil washing down.

Plants may be grown in comparatively small pots if watered occasionally with a weak solution of guano, or sulphate of ammonia.

HOW TO PRESERVE CUT FLOWERS.

An important rule, though seldom regarded, says Popular Science News, is never to cram the vases with flowers; many will last if only they have a large mass of water in the vase, and not too many stalks to feed on the water and pollute it. Vases that can hold a large quantity of water are much to be preferred to the spindle-shaped trumpets that are often used. Flat dishes filled with wet sand are also useful for short-stalked or heavy-headed flowers; even partially withered blooms will revive when placed on this cool, moist substance. Moss, though far prettier than sand, is to be avoided, as it so soon smells disagreeably, and always interferes with the scent of the flowers placed in it for preservation.

In the case of flowers that grow only in a cool temperature, and suffer when they get into warm and dry air, all that we can do is to lessen evaporation as much as possible, and, when such flowers have hairy stems and leaves, to submerge them for a minute, so that by capillary attraction they may continue to keep themselves moist and cool; but this is dangerous to table-cloths or polished surfaces, unless care be taken that the points of the leaves do not hang down to prevent dripping.

Another means of preventing delicate and sweet-scented flowers from flagging, is to cut them with several leaves on the stem, and, when the flower-head is placed in water, to allow only this head to remain above the water, while the leaves are entirely submerged: by this means the leaves seem to help to support the flower, which will then last for three days in a fairly cool room. Frequent cutting of the stem is of great use; but with all flowers, by far the best plan is to put them outside exposed to dew or rain, during the night, when they will regain strength enough to last on for days. All New-Holland plants, particularly flowering Acacias, are benefited wonderfully by this apparent cruelty, and will even stand a slight frost far better than a hot room at night, indoors.

OUR WINDOW BOX.

The new *Begonia hybrida gigantea*, now introduced from Germany, is said to have flowers six inches across, probably the largest of the family.

A properly arranged window-box, judiciously planted and cared for, may sometimes give more pleasure to its owner than a large garden.

Those really anxious to grow plants will always find out ways and means to gratify their tastes, even under apparently insurmountable difficulties.

The Scarborough Lily, *Vallota purpurea*, is one of the most easily grown and prettiest window plants, yet it is seldom seen outside of florists' establishments.

A healthy Date Palm, which its owner, a dock laborer, had raised from a seed, in a dingy little room in a tenement house, was awarded a first prize at a London flower show, much to the delight of its owner.

Lawn and Landscape.

OUR ELMs.

Of all common native trees which submit readily to the requirements of the gardener, the American Elm is the most universally prized for shade and ornament. No other tree assumes such elegant forms of top, or

WHITE ELM.

presents such graceful spray as this, and few are more cosmopolitan in regard to soil and culture. Notwithstanding the familiar acquaintance which nearly every one sustains with this noble tree, it is very commonly confounded with two other native and less valuable species. It is important, therefore, that the difference between these species be known.

Ulmus Americana, the common Elm which is distributed throughout the Northern States, is known under a great variety of names. It is so variable on different soils that farmers often recognize two or three different kinds, and regard these kinds as distinct from each other as the Slippery Elm is from the *Ulmus Americana* itself. Trees which grow on rather high land, in exposed places, producing good timber, are usually known as White or Rock Elms, although both these names are often applied to *Ulmus racemosa*. The perplexity surrounding the common names of our Elms, is proof enough of the imperfect knowledge concerning them. The only term which appears to be infallibly associated with one species is "Slippery," which is applied to *Ulmus fulva*.

Our three species of Elms are never more easily distinguished than in winter and spring. The buds of the common White Elm, *Ulmus Americana*, are long and smooth. Those of the Red or Slippery Elm, *Ulmus fulva*, are short and hairy, while the corky bark and peculiar habit of the Cork Elm, *Ulmus racemosa*, at once distinguish the species from both the others. Everyone is familiar with the peculiar though various forms of the White Elm. The spray of the Red or Slippery Elm is stiff and straggling,

never assuming the graceful sweep or droop of the White Elm. Its top is loose and not well filled out. The Cork Elm grows very slowly and the dark ridges of cork along its branches give it a stunted appearance. It usually retains its main trunk something after the manner of the Firs, and sends off stout horizontal or slightly inclining branches.

In outline of leaf the three species are not strikingly different. The leaves of the Cork Elm usually taper more abruptly at the apex than do those of the other species. When young, the leaves of the Red Elm are downy, but the upper surface soon becomes harshly rough.

The fruit affords decisive distinctions. That of the White Elm is small, and hairy on the edges. That of the Cork Elm is larger, more hairy, thicker, with a sweet and nearly edible meat. The fruit of this species may be compared to a Pumpkin seed. The Red Elm fruit is variable in shape, but is usually nearly circular in outline, as in the figure, and it is always smooth on the edges.

The wood of the Red Elm is dark colored, soft, and straight grained. In this last character it is distinguished from both the other species. The wood of the Cork Elm is tough and very elastic.

For ornament the White Elm is superior. The Red Elm grows rapidly and takes well to different soils, but its habit is too stiff and unsymmetrical to allow of any considerable use as an ornamental tree. The Cork Elm is decidedly picturesque. Those who do not know the tree, however, generally take it to be a stunted and diseased White Elm, and

SLIPPERY ELM.

their impressions are therefore unpleasant. I have never yet seen a person, other than a botanist, who recognized any permanent distinction between this and the White Elm. The Cork Elm is a very slow grower. I have never known a tree above 30 inches in diameter. I should recommend the use of the Cork Elm more as a curiosity to be planted at some distance from the house,

than as an object of ornament. The tree is perfectly hardy throughout the North; indeed, it attains its greatest perfection north of latitude 43°. In eastern extension, both this and the Red Elm barely reach New England.

The English Elm, *Ulmus campestris*, which was early introduced into this country, and extensively planted in the Eastern States, principally in and near Boston, and on Long

CORK ELM.

Island, is a lofty tree of less spreading habit than our White Elm, the general form of its head being more inclined to be pyramidal. As a shade tree it is more compact and dense in its foliage, which makes it more suitable in the formation of masses or groups.

L. H. BAILEY, JR.

LAWN RAKINGS.

The Yellow-wood, *Cladrastis tinctoria*, is one of our prettiest native trees. It reaches its northern limit on the Ohio, but is hardly as far north as Boston. Its flowers are pea-shaped, white, sweet-scented, appearing in June in great profusion, in long, drooping racemes, completely covering the tree.

The length of the intervals between the cuttings of the lawn cannot be definitely stated, as the growth of grass varies according to the condition of the weather. In a damp, growing season it should be mown once a week at least, while in very dry weather it may remain uncut for two weeks.

When we think of the great variety of our native trees, says a correspondent of *Vick's Magazine*, it would seem that there is no proper reason why they should not be numerously represented on large grounds, and especially on the grounds of public institutions, which are often ample for the purpose. The value of these trees in their ornamental aspect is sufficient to warrant a considerable effort to procure and plant them.

The difficulties attendant upon procuring many species of native trees is a valid excuse for their disuse on private grounds. But a far greater variety is obtainable from nurserymen than is generally employed.

Foreign Gardening.

AN ENGLISH JAM FARM.

It is well known that the planting of fruit trees extensively in orchards, as so commonly practiced in this country, says A. S. Fuller, has always been discouraged by the land owners of Great Britain. There are some counties in England that have been noted as excellent fruit regions for the past 500 years or more, but, as a rule, the owners of large estates have encouraged the raising of grain and meat to the exclusion of articles like fruit, which are usually looked upon as luxuries instead of actual necessities. But the great progress in fruit culture in the United States, and the annual shipment of green, dried, and preserved fruits to English ports, has had a beneficial effect upon our English cousins, and some land owners have for several years been encouraging the planting of fruits on an extensive scale.

In the Pall Mall Gazette is an interesting account of "Lord Sudeley's Jam Farm," which now comprises 285 acres of arable land, near Toddington. The fruits planted consist mainly of Plums, Raspberries, Gooseberries, and Currants: 40,000 Plum-trees have already been planted. Of Strawberries five tons were gathered in one day last season; 300 pickers are employed during the busy season, and all the fruit goes to a jam factory near by. The proprietors use all the fruit raised on the farm mentioned, and purchase from small farmers and gardeners in the neighborhood. At this factory the bottles used in a year cost about \$5,000.

The land upon which this fruit farm has been established, required a great deal of preparation before it was ready for the trees and bushes, such as draining, leveling fences, burning of clay, planting hedges for shelter, etc. In addition to the inside hedges planted to protect the small fruits from cold winds, we are informed that the entire farm is surrounded with a row of Canada Poplar (*Populus Canadensis*). If such screens and hedges are needed in the comparatively mild climate of England, they would certainly be beneficial in most localities in our Northern States.

Another adjunct to this Jam Farm worthy of note is the addition of an apiary. It has long been claimed that the setting of fruit is greatly assisted by the visits of bees to the blossoms, and in England it is said to be especially true with Plums. This apiary consists of 165 hives, under the management of an experienced apiarian, who thinks that under fair treatment and in favorable seasons he will obtain from 40 to 50 pounds of honey from each hive annually.

GREENLAND VEGETABLES.

One should hardly expect that any cultivated plants could be grown in so high a latitude, yet, according to the statement of Dr. Rink, some of the attempts that have been made in Greenland to raise vegetables have been tolerably successful.

At the Danish station of Godthaab (latitude 64°), close to the open sea, Turnips, Radishes, Lettuce and Parsley are almost the only plants that can be cultivated with any success. The Turnip, indeed, requires

a favorable summer to produce anything like tolerable specimens. The Cabbages are scarcely worthy of the name, but at two island stations up the fiord, about 30 miles north of Godthaab, the climate is strikingly different. Here, Turnips always come to perfection; Carrots prosper well, and attain a fair size; and Cabbages, though unable to develop thick stalks, yet produce tolerably large leaves, which the provident Danes stow away for winter use.

Attempts have been made to cultivate Potatoes, but the tubers never attain a size larger than marbles, and are only grown and eaten as curiosities. Under the most favorable circumstances green Peas only produce shells, in which the Peas are barely recognizable. This is within the Arctic Circle, or at least on its immediate borders. In South Greenland—the site of the old Norsemen's settlements—horticulture is practiced under more favorable circumstances. At some of the posts, in about the same latitude as Christiania, good Carrots have been produced, and in a forcing frame, Strawberries have grown well and yielded fruit for several years, but they afterward died, owing probably to the severity of the climate.

At Julianshaab Turnips often attain a weight of more than half a pound, and are fit for the table in the middle of July. Radishes are fit to be eaten in the middle of June. Rhubarb grows pretty vigorously, and can be raised from seeds. Green Cabbage attains a good size, but never the normal taste and pungency of the vegetable. At Jakobshavn, in 69°, 13 m., Dr. Pfaff used to raise a few Radishes, and the locality being sheltered, the tiny patch of earth on the rocks, which in that remote place passed for a garden, produced "crops" almost as luxuriant as Godthaab in the south.

THE NEW SOUTH WALES NATIONAL PARK.

The Government of New South Wales have followed the example set by the American people in reserving the Yellowstone Park as a ground to be kept forever in its pristine state. The Australians have resolved to preserve one of the finest and most picturesque portions of the colony for a national park. The latter is situated in the Illawarra district, and embraces an area of 36,000 acres, having a frontage of $7\frac{1}{2}$ miles to the Pacific Ocean. The park generally may be described as high table land, from which at numerous places excellent and extensive views are obtained of the ocean, Port Hacking, Botany Bay, Sydney, Randwick, etc., with deep gorges and rich flats, covered with beautiful foliage, bordering running streams of the purest fresh water. The high table lands, to some extent, consist of the comparatively barren, stony heaths, and of fair to good land, the latter in areas suitable for formation of recreation, review, and equipment grounds, or of plantations of ornamental trees, etc., and readily accessible, situated at elevations of from about 350 feet to about 900 feet above high water mark.

The valleys of the principal water courses, notably of Port Hacking River and Bohn Creek, are to a large extent covered with rich foliage, including Cabbage-tree and Bauhinia Palms, Tree-ferns, Christmas Myrtle, and other handsome shrubs, numerous large, well-grown Blackbutt, Woollybutt, Turpen-

tine, and other noble forest timber trees, rising at the part southerly and southeasterly above the confluence of Bohn Creek with Port Hacking River, to heights up to nearly 200 feet, and bordering and adjacent beautiful streams, having occasional long reaches of deep, shaded, pure, cool, fresh water. The park will be made easily accessible from Sydney by the Illawarra Railway, now in course of construction, which will traverse a considerable portion of what may be regarded as one of the finest public recreation grounds in the world.—*Scientific American*.

CHINESE GARDENING.

A correspondent of *Vick's Magazine* gives an interesting account of how a Chinaman gardens in Georgia. He says: After Ah Yut Sing had procured his seed of Cabbage, Tomato, Melon, Cucumber, etc., he immediately began his process of preparing them for the soil. His experiments with each of the above named seed were truly interesting. For one week before he planted them in his carefully prepared mellow soil, he subjected them to a curious process of soaking and bathing in a liquid made with water and the sweepings of the fowl house. He would carefully separate each variety of seed into parcels and suspend them in a glass vessel (candy jar) that was half-filled with this liquid, and pains would be taken not to let the seed touch the liquid, and he would let them remain for six or seven days, when they would be swelled to twice or three times their usual size; then they were planted.

His vines of Cucumbers, Tomatoes and Irish Potatoes seemed to be his pets, and were planted under the eaves of the house, where the rain water would have fallen upon them if the wily Celestial had permitted it, but such was not the case. He had constructed a tin gutter, made of thrown away oyster cans, which conveyed the water to barrels, where he wanted it for laundry use, and not to fall upon his bed of vines. But this tin gutter served a double purpose; when the vines had begun to run, small holes were punctured in the tin gutter and a mixture of water and fowl dung was placed in the gutter, and a gradual dripping which descended into the midst of the vines made them grow like "wild-fire" and produce fruit abundantly. A trellis was made of twigs for the vines to climb upon, and by this process the amount of Tomatoes, Cucumbers, Squashes and Melons that were grown was marvellous. The vines were the largest, the healthiest, and most fruitful of any we have ever seen.

His vegetables commanded a premium in the market, and were noted for their size, flavor and freshness. But Ah Yut Sing was too economical to eat the fruit of his own labor; he would sell his choice vegetables to the epicures at a nice figure, and buy the stale unsold lots that were offered at a discount in the market.

SHRUBS IN POTS.

Hardy shrubs in pots are frequently used in England for indoor decoration and the ornamentation of balconies, verandas, etc. They withstand a great amount of harsh treatment, and a good, healthy shrub is certainly more ornamental than a sickly, tender plant.

Exhibitions & Societies.

AMERICAN INSTITUTE FARMERS' CLUB.

The Club's spacious, well-lighted, and cheerful new meeting room at Clinton Hall was inaugurated on the 18th of June, with a highly interesting and enjoyable exhibition of Strawberries, Roses and other flowers and plants. The unusual lateness of the season prevented growers from the Hudson River region and Connecticut participating as largely as they would have done had the season been earlier. As it was, northern berries were only beginning to ripen, and the chief exhibits came from New Jersey.

J. T. Lovett, Little Silver, N. J., was awarded the first premium for the best collection of twenty-five varieties, and many other first premiums for single quarts.

E. & J. Williams, Montclair, N. J., exhibited a remarkably choice collection of single quarts and received several first premiums.

The center of attraction, however, were the new varieties, many of which were of rare excellence and great promise. E. W. Durant, Irvington, N. J., competed with his new Cluster King, King of the North, and others. Wm. Parry, Parry, N. J., had in addition to his Parry, Lida and Bomba. J. T. Lovett showed Parker Earl, a new variety of great promise. P. M. Augur & Son made a splendid display with their Jewell, of which both berries and plants in bearing were shown. This variety competes also for "THE AMERICAN GARDEN PRIZE." As the conditions required the judges to examine the plants and fruit on the ground, the prize for the best new seedling has not yet been awarded. P. Henderson & Co. showed a plate of "Henderson," but owing to the very unfavorable season, the sample did hardly justice to this new variety.

The first prize for the best flavored variety was awarded to Prince of Berries.

The exhibition of Roses was one of rare excellence and beauty, seldom equalled in New York. All the best new and old varieties were represented; especially noteworthy were Gen. Jacqueminot, Mad. Victor Verdier, Baronesse Rothschild, Paul Neron, Captain Christy, Comtesse of Oxford, Senator Vaisse, Prince Camille de Rohan, La France, Sunset, La Rosière, Anna de Diesbach, Moss Rose cristata, and centifolia, etc.

Schultheis Bros., College Point, N. Y., were awarded the first prizes for collections and many single varieties. This firm deserves special recognition for renewing their entire exhibit on the morning of the second day, making in fact a better display than on the first day.

J. G. Rechamps & Son, New York, carried off most of the second prizes for collections.

Albert Benz, Douglaston, L. I., made a remarkably fine exhibit of single varieties for which first prizes were given. The Gen. Jacqueminots and various Moss Roses elicited the admiration of all.

Beautiful Orchids are not a rare occurrence at New York flower exhibitions, but the exhibit of Mr. Wm. C. Clement, gardener to Mrs. Chas. Morgan, on this occasion did certainly excel any similar collection shown here. It would have been worth a considerable journey to see these Orchids alone.

The actual cost of the plants in this exhibit was over \$10,000. A *Lalia elegans alba*, for which was awarded the first prize, had sixteen immense flowers and was a model of vigor and good culture. Among the most striking specimens of the collection were: *Cattleya gigas regina*, *C. aurea*, *C. Mossiae insignis*, *C. Wallichii*, *Odontoglossum vexillatum*, *Oncidium flexuosum*, *Lalia majalis*, *Ceroides vivens*, *Cypripedium niveum*, *C. Lawrenceanum*, *C. Selligerum majus*.

Another fine collection of Orchids for which a second prize was awarded was shown by W. C. Wilson, Astoria, N. Y.

Richard Brett, gardener to James R. Piteher, Shorthill, N. J., exhibited a gorgeous collection of Peonies, some sixty named varieties, comprising every imaginable shade of color and variety of form possible in this class of plants. Mr. Piteher in making a specialty of these somewhat neglected flowers, is doing a good work, showing their grand capabilities.

Hallock & Thorpe filled nearly an entire table with a miscellaneous collection of Gladioli, Lilies, Irises, Peonies, Chrysanthemums, etc.

The most striking exhibit in regard to decorative effect was John Finn's collection of Palms, comprising some two dozen specimens, most of which were of rare excellence.

Mons. Jules Lachaume, Director of the Garden of Acclimation of Havana, Cuba, showed a highly interesting collection of new textile fibers of Palms, Yuccas, and other tropical plants, some of which, he is confident, will become powerful rivals to wool and cotton even, as their supply is almost unlimited.

The semi-monthly meeting of the club was held on the same day of the exhibition. The subject for discussion being "The Strawberry," a large number of prominent fruit-growers participated. Among those present were Rev. E. P. Roe, Judge Wm. Parry, A. S. Fuller, W. C. Barry, Chas. A. Green, P. T. Quinn, J. S. Woodward, Col. M. C. Weld, P. M. Augur, J. T. Lovett, E. W. Durand, Dr. J. B. Ward, E. Williams, Sam. Parsons, J. B. Rogers, C. W. Idell, E. D. Putney.

GREATER CONSUMPTION OF FRUITS NEEDED.

Read by E. Williams before the American Institute Farmers' Club.

If I could wield the pen as easily and gracefully as some of my contemporaries of bygone years, and had written a book on Strawberry culture, or on success with small fruits, or on fruit culture for profit, or on its failures and losses, I should probably long since have received my diploma and graduated into the editorial chair of the "Bungtown Fruit Grower," or taken charge of the Agricultural Department of some prominent weekly paper, in which case I should no doubt find, as many others have done "who have gone before me," that the profits of fruit growing were very alluring on paper, and that the pen, pencil, and printer's ink were the chief implements used to produce these profits.

For a change I would suggest that some of these ex-fruit-growers would write a book on "Failures in Fruit Growing;" not their own failures, we could hardly expect them to overcome their modestly sufficient to perform such a task. But to record the failures of others would be an easy matter, and the wrecks and blasted hopes that have lined

the shores of the horticultural world during the last twenty-five years, afford abundant material to make a work of interest, a fitting companion to "Fruit Growing for Profit."

Occasionally we find a person who has become "well fixed" in life, recount some little incident of failure in his past career with a laugh, but references of this kind are confined to this class, they can afford it. But people who fail in business of any kind, do not as a rule like to think of their mistakes, much less talk about them, and yet these failures and the causes thereof could teach more important lessons than all the successes on record, but they seldom are made public. It is the successes that are wanted for record, not the failures, and these successes on paper are often false lights on the shore, luring the unsuspecting and innocent traveler onto the rocks and shoals that lie hidden beneath the surface.

But success in Strawberry or other fruit growing, as already stated, is not confined to growing the crop, but includes the selling of them, and here is where the failures and the most important ones occur. What profiteth it a man if he gain the whole crop and lose the whole market? In most recorded successes of large crops it is the prospective returns and profits that are the alluring feature held out to view. The profits of fruit culture are what we are all contending for, and which I am sorry to say, are "often sought but seldom found."

Last season first-class berries in fine condition, and plenty of them, sold in this city for 10 and 12 cents per quart, with poorer grades for one-half the money. Now deducting freights and commissions, what is there left to pay the grower for his time, labor, fertilizers, baskets, crates, picking, etc., etc.? The most powerful magnifying glass would fail to detect the grower's profits.

Now it will be said this is all owing to a glut in the market, over-production, etc. Well, in a measure this may be true. But for all that we need a new departure. Instead of encouraging greater production, let us encourage greater consumption. Let our efforts be directed to the educating of the people to consume more fruit, to make it a daily, generous diet. Let us teach the masses, the working classes, that a generous diet of ripe fruit is better for their health and the health of their families, more cooling and refreshing to the system than beer and other stimulants of like nature. Fruits are more nutritious than most vegetables, more than half as valuable as potatoes; pound for pound, they are fully as valuable in connection with meats and carbonaceous food for health and comfort.

Let us try to teach the people that they can afford to buy and consume fruits in much larger quantities, even at higher than average prices. This will benefit themselves as well as the fruit growers, and contribute largely to make fruit growing and fruit eating a successful and profitable business.

I entreat all true fruit growers and fruit lovers not to hold out the alluring temptation of profit to be derived by the prospective grower from certain new varieties, that they may be able to sell the plants; but instead to encourage greater home consumption, which with many will be found the most profitable part of the business.

AMERICAN NURSERYMEN'S ASSOCIATION.

The tenth annual meeting of this association convened in Chicago June 17-19, with nearly 250 members present from all sections. President Edgar Sanders in his annual address said that the tendency of the age is toward associations to modify and control output and prices. With capital this is called monopoly; with labor, amalgamation. An association like this is bound to be beneficial. He advised the readers of papers to make them as short as possible, and leave a chance for free discussion. He showed that nurserymen and florists had much in common, but stood on a different plane as to their methods and wants, consequently separate associations and joint conventions were alike to be commended. He argued that the "tree agent" is a necessary evil, and not so much of an evil after all.

G. H. Miller of Ohio in a paper on "Nurserymen as Teachers of Horticulture," dwelt on the great improvement in methods. He held that it was the duty of nurserymen to educate the masses in horticulture. Homes, school-houses, churches, gardens, plots, and parks would be greatly beautified if people had an elementary knowledge of floriculture and horticulture. Every horticulturist should have experimental grounds for testing new varieties and otherwise keeping himself abreast of the times.

J. Jenkins of Ohio had found it more remunerative to pay skilled than unskilled labor in his nurseries. Several speakers were of the same opinion, but one or two thought a skilled foreman was enough. All agreed that to have skilled men, a training in boyhood is necessary. Men so trained always command good salaries.

Mr. Jenkins thought nurserymen were behind the times in the matter of labor-saving implements, and described several useful implements of his own invention.

N. H. Albaugh of Ohio read a paper on budding and grafting. For success in budding, stocks must be healthy, hardy, and of good size. Rich black loam is not the best; a friable loam, with liberal applications of barnyard manure, is better. Whole stocks should be used in budding, and whole roots in grafting. Cuttings do for Grapes, Currants, Gooseberries, and the like, but are not the natural manner of tree propagation. He thought growing on whole roots paid better in the end than growing on cut roots.

M. A. Hunt of Wright's Grove, Chicago, pointed out the comparative advantages of steam and hot water heating, and showed that by practical experiment steam had been the more successful. Its advantages lie especially in economy of fuel, rapidity of action in the regulation of the temperature, and cheapness of construction.

The transportation problem was the subject of a general informal discussion. It was held that shipments by nurserymen do not receive due attention and care. A. J. Caywood of New York thought there was no way to bring soulless corporations to time except by litigation. Moral suasion might be very good, but when damage or delay occurred process by law would be his method. Some of the members thought the railroads would be willing to meet the wishes of the shippers if they only knew how, and acted mainly through ignorance.

The Committee on Transportation was instructed to inquire into the question of express and postal charges on plants and seeds, with a view to getting lower rates.

On Thursday afternoon a delightful excursion on the lake was given the members through the courtesy of Messrs. Lord & Thomas, the enterprising Chicago advertising agents.

Reports on the condition of the trade showed stocks to be in good order with some increase in the supply, and business fairly prosperous.

It was resolved that the next annual convention be held at Washington, D. C., and the following officers were chosen for the coming year: President, Norman J. Colman; vice-president, Franklin Davis, Baltimore, Md.; secretary, D. W. Scott, Galena, Ill.; treasurer, A. R. Whitney, Franklin Grove, Ill.; executive committee,—George B. Thomas, West Chester, Pa.; S. D. Willard, Geneva, N. Y.; C. L. Watrous, Des Moines, Ia.; second vice-presidents: Alabama, W. F. Heikes; Ark., W. E. Thomas; Cal., C. W. Reed; Col., D. S. Grimes; Conn., Edwin Hoyt; Dak., L. Preston; Del., Randolph Peters; D. C., William Saunders; Fla., A. J. Bidwell; Ga., U. S. Sanford; Ill., J. B. Spaulding; Ind., John Freeman; Ia., Silas Wilson; Kans., J. W. Latimer; Ky., R. W. Downer; La., N. K. Klingman; Me., Thomas Jackson; Md., William Corse; Mass., J. W. Manning; Minn., S. M. Emery; Mich., L. G. Bragg; Miss., W. H. Caswell; Mo., J. M. Boyles; N. J., J. T. Lovett; Neb., J. F. Allen; N. Y., George G. Atwood; N. C., J. Van Linley; Ohio, S. D. Bair; Ont., E. N. Morris; Ore., C. Dickinson; Penn., Abner Hoops; Tenn., A. W. Webber; Texas, J. R. Johnson; Va., E. H. Bissell; Wis., George P. Paffer; Wash. Ter., A. H. Salmon.

AGRICULTURAL CONVENTION AT WASHINGTON.

This convention, previously announced to meet in June, has been postponed, as will be seen by the following letter:

Dear Sir: A sufficient number of favorable replies having been received to my last circular, to indicate a decided preference for the date of July 8th for holding the Convention of Agricultural Colleges and Experiment Stations, I have to inform you that such date has been finally determined upon. This will not only not conflict with the commencement exercises of many of the Colleges, but will also offer to those desiring to attend the Convention of the National Educational Association at Saratoga on July 14th, an opportunity to attend both Conventions without too much loss of time. I am endeavoring to perfect an arrangement with the Pennsylvania Railroad Company by which all those arriving here by that line can have reduced rates to Saratoga.

NORMAN J. COLMAN,
Commissioner of Agriculture.

AMERICAN POMOLOGICAL SOCIETY.

The forthcoming meeting Sept. 9, 10, 11, of this society is already creating a lively interest among the people of Michigan. The State Horticultural Society, the Farmer's Club and all other societies of this class will combine, says the Grand Rapid Times, and make an exhibition that will bear a national reputation. The State Legislature appro-

riated \$1,000 by a unanimous vote.

Aside from the display of fruits, etc., a number of interesting papers will be read by the highest authorities in the country. These lectures will be given in the form of popular addresses and will be profusely illustrated. The necessity of a large hall in this instance plainly demonstrated. The Army of the Cumberland meet the week following the Pomological display, and it is proposed that the two organizations combine forces and erect a temporary building large enough for the use of both.

AMERICAN SEED TRADE ASSOCIATION.

At Rochester June 9-11, some 30 or 40 seedsmen met in convention and discussed topics of great interest to the trade. Many large houses were not represented at all. Those present showed marked enthusiasm in the progress of the seed business. A noticeable event (?) was the absence of discussion on any phase of the seed-growing or improvement of varieties. It is proposed, we understand, to have papers by specialists next year that will discuss the progress of knowledge in this important agricultural industry. The excursion on the lake and entertainment by the Rochester seedsmen was highly enjoyable, and reflected credit upon the liberality of the entertainers. The committee of arrangements, Messrs. Vick, Morehouse, Chase, Crossman and Mandeville, won pleasant remembrances from all the company.

CARE OF GOLD-FISH.

The ease of fungus growing on gold-fish, says Seth Green, is that the slime or scales of the fish have become rubbed off, either by handling or some other means. If you wish to move your fish from one vessel to another, you should use a net made of some kind of thin, soft material—mosquito netting or an old veil will answer. They should never be taken in the hands. You may not have handled them, but some one else may have done so, either before or after you purchased them. The only cure I know of for the white fungus, is to make a strong brine of common salt and put the fish into it for a minute or two, then immediately put them back into fresh water. Do this three times a day. If you commence doing this when you first discover the fungus growing on them, you will sometimes cure them.

When you have healthy fish, keep them well by changing the water every time they come to the top and keep opening their mouths, and seem to be breathing more air than water. When you change the water do so by taking about one-half out at a time and replacing it with fresh—a full change is very apt to prove injurious. Give them plenty of food, such as angle-worms, or any kind of insects, or fresh meat cut into small pieces; fish-wafer is also good. They should have a change of food every week or so.

Without frequent mowings a lawn cannot present a velvety, attractive, and finished appearance.

To have Lilacs bloom plentifully every year, the flowering stems should be removed as soon as the blossoms have dropped, and all suckers should then be cut off leaving only a few clean stems.

Rural Life.

COUNTRY SMELLS.

If the most delicious of country smells belong to the summer and autumn, making a climate for themselves of our gardens and orchards, the most delicate are the birth of spring, and are wild and coy as a mountain nymph. Is there any epoch in the annals of a country year like the advent of the first wild-flowers? The first snow is an event of dubious delight, except to the boys; and the first Asparagus and Pie-plant from our own garden is comparatively a gross enjoyment. But the first spring day on which we come home with a sprig of Trailing Arbutus or a bunch of pale or purple-eyed Hepaticas, or only a handful of Saxifrage or Anemones, is the real jubilee of the year: and their fragrance, as unobtrusive as themselves, is the "still small voice" of a new life of nature. It is the perfume tolled from the "floral bells" of the early wildflowers, which really rings "the old year out and the new year in." And the day when little Bess comes in with a clump of Violets in her chubby fist makes us all children again.

The first Red Clover is a little sunrise. Nothing in nature gives me a more blessed sense of "the wideness of God's mercy" than the way He has sown the earth with these bright and balmy flowers of the grass, "like the wideness of the sea." And I am as thankful for the exquisite scent of the White Clover as the bees are for its honeyed store. The Sweet Clover, too,—it grows along the railway embankments here for miles, whitening them with its feathery blossom, and filling the atmosphere with an almost oppressive fragrance when the grass is cut.

As the summer advances the earth becomes recharged with heat and sighs out its relieved heart in shady places and by streams of water or in swampy and meadow lands, like some naiad or water-nymph escaped from the hot pursuit of Pan or Apollo. And at night when the citizen is conscious only of the radiation of the day's stored up heat from the paving-stones and bricks, the air which floats in at my window, or surrounds me as I walk like the cloud with which Athené enveloped Diomed, is aromatic with the exhalations of the cool, clean earth (it is a great mistake to confound the earth with dirtiness), and with the breath of the Honey-suckle at the porch, the Pine-trees on the ridge, and the fine grass which the mower left upon the lawn at sundown. It was in the night that "the soul of the Rose" went into the blood of Tennyson's hero-lover, and

"The Lilies and Roses were all awake,
For they sighed for the dawn and thee."

And so in the mimic twilight of the woods in the hot midsummer. The very essence of the country to me is in its *woody* smells. There may not be more tonic in them than in those of the seashore, but they are more highly medicated. My "mind diseased," as well as my body dyspeptic, responds to the first warm, aromatic gush that greets me as I pass the "woody hollows" in a drive, or step into the balmy shadows of the Pine grove. An invalid friend, who went every summer to Saratoga with much benefit, used

to insist that it was not more the Springs than the Pine woods (this was before the surrounding country had been "improved" into sandy barrens), which made it the sanitarium it is. And more than once have I lain under the solemn and spicy trees with him, drinking of a water of life which no "Congress" or "Columbian," hot or cold, could furnish at ten cents a glass.

There are two varieties of woody smells. One is dry, warm and aromatic, pervaded by the delicate emanations of leaves and wood, or redolent of Wintergreen, wild Grape or Sassafras, the pungent Pennyroyal or the thuriferous Pines, Hemlocks and Cedars. The other is merely that of cool, moist ground, damp leaf-mould and decaying wood and earth-breathing Fungi. These latter, doubtless, are not the spots for camping out, but I confess to a liking for them. When I catch even a whiff, as I pass along the wooded road or cross a bridge over a woodland stream, I seem to have got a deeper breath and a more soothing touch of Mother Earth than anywhere else. I smell to-day (with the organ of memory) the black mould of a swampy forest through whose paths, bordered by canals full of a wine-colored water, I walked to school in my small boyhood. It is an annual necessity for me to get the genuine greenwood smell, brewed only in the confined still-room of the woods; and I am conscious of a virtue passing into my jaded nerves, as soon as I have inhaled the first steamy gush of its frankincense and myrrh.

I think that the ethical idea is more predominant over the merely aesthetic in this one of the senses than in any of the others. How naturally does the poet say that the actions of the just "smell sweet," as well as blossom, in the dust. Old Jacob showed his knowledge and love of Nature and God alike, when he spoke of "the smell of a field which the Lord hath blessed." Its religious associations are primeval and universal. Fragrance is everywhere the emblem, if not the instrument, of worship. When His people offer Him a pure offering, Jehovah "smells a sweet savor." The poet thus addresses the flowers:

"Ye matin worshippers! who bending lowly
Before the uprisen sun, God's lidless eye,
Throw from your chalices a sweet and holy
Incense on high!

"Nearth cloistered boughs each floral bell that
swingeth,
And tolls its perfume on the passing air,
Makes Sabbath in the fields, and ever utereth
A call to prayer!"

—Dr. F. N. Zubriskie in *Christian Intelligencer*.

DRY HOUSES AND HEALTH.

At a recent convention of the Michigan Tile Makers, Prof. R. C. Kedzie related the following incidents in evidence of the importance of selecting a dry situation for a residence:

Two brothers in Vermont, of strong and vigorous stock, and giving equal promise of a long and active life, married wives corresponding in promise of future activity. They had both chosen the healthiest of all callings—farming. One of the brothers built his house in an open and sunny spot where the soil and subsoil were dry; shade trees and embowering plants had a hard time of it,

but the cellar was dry enough for a powder magazine. The house in all its parts was free from every trace of dampness and mould; there was a crisp and elastic feel in the air of the dwelling; the farmer and all his family had that vigorous elasticity that reminds one of the spring and strength of steel; health and sprightly vigor were the rule, and sickness the rare exception. The farmer and his wife, though past threescore, have yet the look and vigor of middle life.

The other brother built his house in a beautiful shady nook, where the trees seemed to stretch their protecting arms in benediction over the modest home. Springs fed by the neighboring hills burst forth near his house, and others by his barns; his yard was always green even in driest time, for the life blood of the hills seemed to burst out all about him in springs and tiny rivulets. But the ground was always wet, the cellar never dry, the walls of the room often had a clammy feel, the clothes mildewed in the closets, and the bread moulded in the pantry. For a time their vigor enabled them to bear up against these depressing influences; children were born of apparent vigor and promise, but these, one by one, passed away under the touch of diphtheria, croup, and pneumonia; the mother went into a decline and died of consumption before her fiftieth birthday, and the father still lives, but is tortured and crippled by rheumatism.

PLANT TREES.

There are portions of every farm, not well adapted to cultivation of the soil, where trees will grow if permitted, says H. N. Howard, in the *National Farmer*. In the clearing up of new farms, instead of the wholesale, sweeping destruction of all forest trees, there are always certain spots where trees may be left where the soil is not worth the trouble of cutting off the timber, and where the timber, if left to grow, would remain a source of profit and income.

On all old farms there are also spots which the plow never reaches, but which, if planted in trees, would reclaim something lost. The rich, alluvial pastures of every farm are best utilized by tilling the soil, while the more sterile portions are more useful for the growth of fruit or forest trees. Such alteration of forest and field is economy of space; it enhances the artistic beauty and picturesque effect of farm scenery. Small fields, amidst forests, are always found everywhere more fertile, other things being equal, than large, open fields without forests. In fact, this system of field and forest is more economical, more picturesque, more gratifying to the senses, and more healthful to man and beast. The farmer who adopts such systems will be regarded as a national benefactor, and will create to himself lasting monuments. Plant trees!

BUMBLE-BEE AND SMALL BOY.

Soon will the festive bumble-bee
O'er its little velvet shug,
And polish up right earnestly
His merry little sting.
Soon will the small boy seek the wood
To climb his favorite tree,
And in a happy, carefree mood
Pursue that self-same bee.
Then will that blithesome bee in turn
Cause that same boy to soul
To where he can relieve the burn
By plastering with mud.

Miscellaneous.

SUMMER STYLES FOR FLOWERS.

The majority of the flowers sold at the watering-place hotels are sent from New York; Newport is the only exception, there being so many handsome gardens there, and large floral establishments.

Each of the prominent watering-places has its own peculiar styles in flowers to wear, and to decorate with, every season. White flowers are worn at Newport almost to the exclusion of colored ones, and yellow blossoms are the fashionable tint for some this summer. A few white Mermet Roses are worn and are greatly admired. These are grown in Summit, New Jersey. White Moss Rose-hyds, and the hybrid Merveille de Lyon, are popular.

SARATOGA FASHIONS.

At Saratoga Sweet-pea blossoms are the favorite flower. These, made up into the daintiest *bouquets de corsage*, and into pretty designs of colored straw, are sold on the great balconies mornings and evenings. It is said that one family in the suburbs support themselves the entire year by growing Sweet-pea blossoms for the summer trade. Pink and blue Water-lilies are sent from Boston to Saratoga daily, and sell for large sums at a stand near Congress Spring.

LONG BRANCH FASHIONS.

At Long Branch, Larkspur is the flower most in vogue. It is both blue and pink and combined with Mignouette makes a beautiful belt bunch. In the corridor of the West End Hotel there is quite a flower show each evening before dancing begins in the drawing-room. Large floral designs are sent from New York and are either sold or raffled. Very rich hand-bouquets of pink Roses fringed with Larkspur are carried to the meetings on days of the races: these are fastened to the belt, ribbon or sash which are now fashionable.

Hollywood Park, the residence of Mr. John Hoey, is very attractively laid out this year. Over a million Echeverias have been placed in the carpet beds, and the blaze of Coleus is dazzling.

LONG BEACH.

This summer resort is not behind the other watering-places in its supply of flowers. A tastily arranged booth stands in the rotunda of the immense hotel, where there is all the day and evening a beautiful collection of flowers. These are sent from New York morning and night.

A dinner was given at a cottage last week where there was a decoration of sea-grasses gathered in this neighborhood. There were mats of the tangled grasses for all the covers, and a large, oval center of grass was finished at the edge with a row of shells. The favors were Water-lilies.

WINDOW BOXES, ETC.

Although so many persons are out of town this month, the window boxes and vases that ornament the outside of dwellings receive great care and make the fashionable avenues look delightful. On Mr. Wm. H. Vanderbilt's house are 20 window boxes, which are filled with Agaves, Ivy, and Scarlet Geraniums. These are distinct and effective, very much more so than where there

is a conglomeration of color. Near the side entrance to the residence is a bed containing a general collection of flowers, among which are several rare specimens of Cactuses. In his conservatory Mr. Vanderbilt has a fine display of summer-blooming Orchids.

The hotels, large restaurants, and Club houses are all making a brilliant show with window boxes, and vases of growing plants. Rhododendrons have this year been set out in the courts of these public places, and when in blossom, were conspicuous and handsome.

The new, shrubby hybrid Calceolarias are a great addition to the borders in public parks: these flowers embrace all the shades of orange, brown, crimson and yellow, and are borne in large trusses: they will bloom the entire season if placed in partial shade. The yellow variety known as "Shower of Gold," is set out freely in ribbon lines in Gramercy Park and spangles the beds magnificently.

ROSES LOSING IN FAVOR.

Mid-summer weddings are remarkable for the absence of Roses in the decorations. Gardenias are the favorite flower apparently. A new double Gardenia, *G. Fortunei*, is large, waxy, and fragrant: it is combined with Orange-blossoms and small Orange-fruit. This is quite an innovation. Light mull dresses, and those made of silk tulle, or illusion lace, are trimmed with garlands of Field Daisies, and bridesmaids carry large, broad-brimmed leghorn hats filled with these flowers and swung together with ribbons over the arm. Gladioluses have entered largely into the wedding decorations: they are very showy and effective in vases. A novelty is a sport from *Gladiolus Colvillii*, "The Bride," which is named *G. Colvillii Villede Versailles*. The flowerets are exquisitely beautiful, the white sepals being wonderfully pencilled with vermillion, and the throat being stained with pale purple.

ORNAMENTED CARDS.

A very popular occupation for ladies during the summer, is one with a floral turn to it. All kinds of cards of invitation, menu, and birthday cards are ornamented with imported dried flowers and grasses. These are fastened to a corner of the cards with a fine gum paste, in tasteful combinations. It is fascinating work, and very dainty favors are the result, at a moderate cost. These flowers may be applied to satin successfully. A white satin cushion made for a bridal gift; was bordered with the dried white Cape flowers and edged with very fine Grasses.

FANS.

The styles of decorating fans are very numerous and elegant. The choicest flowers are selected to fasten to the fan. Italian straw fans or small Palm leaves will have a large cluster of Roses or spray of Ferns fastened on them with wires. It is quite the fashion to ornament the parasol with a knot of flowers, particularly at the watering-places, where those of gay colors and light material are carried.

FLORA.

J. H. Woodford says that he keeps insects from his Roses by dredging the bushes with hellebore early in the morning, before the buds form, which kills the first insects that come; then again before the bloom, and after blooming. These three applications are sufficient. We prefer "Buhach" to hellebore.

GINSENG CULTURE.

The Ginseng is a valuable plant growing spontaneously in the forests of Kentucky and mountainous regions of other States. Its favorite location is in rich loamy bottoms and on shaded hill sides. The top of the plant is annual, coming up early in the spring, averaging about twelve inches in height, varying according to the age of the root and the richness of the soil. The plant has three compound leaves, the flowers are small yellowish, the berries bright red. Each plant will produce from fifteen to twenty seeds, which when ripe become scattered more or less around the old plant, and each one will send up a little plant next spring which will get its growth in three or four years. The roots are dug and washed clean of dirt and dried in the sun, and usually sell for \$1.00 per pound dried, or in the green state at 25 cents per pound.

Ginseng is not cultivated anywhere in this country, but there is no reason why it should not be, as all our cultivated plants grew wild originally, and on being cultivated became improved. I am of the opinion that the Ginseng can be improved considerably under cultivation, like many other plants, although it may require special soil and care to make it profitable.

One fall I had loam from the woods hauled and mixed with one-third stable manure. In the following spring in planting out my Strawberry plants a furrow was plowed, filled with this loam, and the plants set in these rows. In weeding, I noticed small, peculiar-looking plants, but paid no attention to them until I bruised one of them and found they were Ginseng. Most of the plants had the seed still attached to their roots when they were some two inches high.

From this experience I am led to the opinion that Ginseng can be successfully cultivated. The ground should be heavily manured, the soil thoroughly pulverized, laid off in beds, and the seed raked in or sown in drills. The plants will be easier kept clean in drills. The second and third summer the plants will be strong enough to produce seed. The next spring after this, when the plants are up pretty well, the roots which are easiest found then, are to be dug.

Perhaps it may require some shade and virgin soil for its successful culture. I would suggest to prepare a bed in the orchard; the heavy manuring will do the trees good if the experiment with the Ginseng should prove a failure. Manure the soil and pulverize well, and haul from the woods rich loam and spread on these beds or in the drills, and sow the seed. If cultivating the Ginseng will increase its size as much as it does other plants, I think roots can be grown an inch in diameter and a foot long, and a thousand pounds to the acre.

THOS. D. BAIRD.

Most plants show to better advantage when grown in small groups or clumps of one kind than when planted singly and intermixed with many other kinds.

A Kansas man poured kerosene around the stems of several hundred Apple-trees just coming into bearing—"to kill the insects and things." The Live Stock Indicator says "they are now deceased; that is, the trees. Loss, \$1,000."

ON THE ROAD.

NOTES BY THE WAY.

After a pleasant two days at Rochester among the seedsmen we paid a visit to Mr. Benjamin Hammond, at Fishkill-on-the-Hudson, to inspect his manufacture of the now famous Slug-Shot. What a name for a destructive agent! Mr. H. began business as a druggist at Mt. Kisco, N. Y. In 1880 a girl came to him and asked for something to kill insects which would not kill her young turkeys. His ready Yankee wit suggested the main ingredients of his Slug-Shot combination, and 20 pounds were made up. This was tried and worked so satisfactorily that the young lady's father next day ordered 50 lbs. more for field use. Mr. H. had at that time been handling about two tons of Paris Green yearly, which so poisoned him that he was made very sick, and obliged to go into bankruptcy. So the new "bug-killer" and turkey-preserver was at once adopted, and the Paris Green discarded for all such purposes. Since that time the article has become generally used, and the demand is increasing rapidly. Partnership troubles compelled him to sacrifice the Mt. Kisco plant, and he took the opportunity to move to Fishkill, where he now makes a specialty of Slug-Shot and cottage paints, having given up the drug trade entirely.

Mr. H. is an honest, bright, hard-working Yankee, and a keen business man. He makes no secret of the ingredients of his Slug-Shot compound, and gives credit to Dr. Hexamer for some of its important features. From what we have learned of the article, we believe it to be efficient, safe and economical.

The Slug-Shot and paint works of Mr. H. are of considerable size and abut upon the dock and railroad. The business has already outgrown the accommodations, and they soon will be doubled in size by additional buildings. I.

CATALOGUES RECEIVED.

John Barth Bros., Overveen near Haarlem, Holland. Wholesale Catalogue of Dutch Flower-roots.

Bakker Brothers, Bennebroek & Vogelzang near Haarlem, Holland. Wholesale Catalogue of Dutch Bulbs.

J. V. Van Zanten & Sons, Hillegom near Haarlem, Holland. Wholesale Catalogue of Dutch Flower-roots.

Peter Van Velsen & Sons, Houtvaart, Overveen, Haarlem, Holland. Wholesale Catalogue of Dutch Flower-roots.

J. T. Lovett, Little Silver, N. J. Announcement of the new "Parker Earl" Strawberry, and general invitation to visit the Monmouth Nurseries during the bearing season.

Peter Henderson & Co., 35 and 37 Cortlandt Street, New York. Summer Price List of Celery, Cabbage, Cauliflower, and pot-grown Strawberry plants; also a list of Turnip seed and garden requisites.

P. Van Der Veld & Sons, Lisse near Haarlem, Holland. Trade Catalogue of Dutch Bulbs and tuberous-rooted Begonias. This is one of the large and reliable establishments of Holland and considering the superior excellence and reliability of the stock sent out the prices seem astonishingly low.

General Bulb Company, Vogelzang near Haarlem, Holland; represented in the United States by De Veer & Boonkamp, 19 Broadway, New York. Special Wholesale Catalogue of Dutch Flower roots and bulbs. This is an exceedingly valuable list, comprising the cream of the best and most desirable in this line, at very low prices. This establishment, it will be remembered, was awarded all the first prizes for Dutch Bulbs, at the New Orleans World's Exposition.

Ant. Roozen & Son, Overveen near Haarlem, Holland. This Catalogue, intended for gardeners, florists, amateurs, and flower growers in general, contains a complete and choice lot of Hyacinths, Tulips, Crocus, Iris, Narcissus, Lilies, Amaryllis, Ranunculus, Anemones, and other Dutch and Cape bulbs, and a large collection of miscellaneous bulbs, plants and roots, as can be found anywhere. This house has made a new departure by sending all their goods direct from their establishment to the purchaser, thus saving a considerable amount of money, and avoiding all risks. All orders from the United States and Canada should be sent to their New York house; De Veer & Boonkamp, 19 Broadway.

OUR BOOK TABLE.

Horticultural Directory. Isaac D. Sallor, Philadelphia. Edited by Chas. F. Evans. These gentlemen have succeeded in making an excellent directory, and far more accurate than anything of the sort heretofore attempted. It contains lists of florists and nurserymen throughout the United States, arranged by States, and is very convenient for sending circulars, etc. Supplements A and B contain European lists of similar character. Price \$6.00. Supplements \$1.50 each.

Michigan Horticulture. Fourteenth annual report by secretary Charles W. Garfield. This elegant volume is at once a treasure and a pleasure, as well as a credit to the accomplished secretary who edits it, to his State and the horticultural profession. If similar reports were published in every large State, the horticultural interests of the nation would develop and increase at an astonishing rate. The number of excellent papers and essays contained in the book is so great that our space does not permit their enumeration.

A Brief of Horticulture in Michigan, which is here embodied, has been referred to in a previous number. But the leading and most unique feature of this report, and the portion that required most thought and study, is the Secretary's Portfolio. In its pages the editor gives a carefully classified selection of the very best things that have been said and written upon horticultural subjects during the year; and, while furnishing readable matter from the best writers of horticultural literature, he aims to make the Portfolio a text-book of horticulture.

ANSWERS TO CORRESPONDENTS.

Late-planted Strawberries.—G. L., Rockville, Md. On dry ground in thoroughly good condition, it will be safe to plant Strawberries up to the middle of November in your latitude. But if the ground is heavy and indifferently prepared it would be better to defer planting till spring.

Labels.—P. A. G., Louisville, Ky.—The most durable label for trees and shrubs is made of rough sheet zinc. Writing upon it with an ordinary lead pencil will last a great many years. Such labels may be fastened with a copper wire, or, if cut with a long, pointed end, they may be twisted around small branches.

Asparagus Beetle.—L. M., Rion, N. Y.—The larve of this insect, if not destroyed, will weaken, if not seriously injure, the plants. Either Slug Shot, or Bismuth, will do the work effectually. The powder should be dusted over the plants in the morning while wet with the dew. Two applications are generally sufficient.

Jasminum hirsutum.—B. H. W., Adrian, Mich.—This is a near ally of *J. pubescens*, and *J. gracillimum*. It is a native of Borneo, we believe, and has therefore to be kept in a warm house in winter. It comes highly recommended as a winter-flowering plant, being exceedingly floriferous, sweet-scented, and of graceful habit.

Training Currants.—R. S., Penn Yan, N. Y.—The principal objection to training Currants and Gooseberries in the form of trees is that if borers attack the stem, which they are only too likely to do, the entire tree is lost, while in the bush form a branch may be missed without much detriment, and others will soon take the places of those lost.

Myrtle.—Constant Reader, New York.—The true Myrtle, *Myrica carolinensis*, is a small tree, native to Southern Europe. There are several varieties of it, all handsome. It is not hardy here. It should be planted in tubs, and during winter placed in a cool cellar. The plant which you refer to in your letter that is commonly called Myrtle,

is the Periwinkle or Creeping Myrtle, *Vinca minor* a native of Northern Europe, and perfectly hardy in our climate.

About Aquatic Plants.—H. W., Philadelphia.

1. Caladiums appear to best advantage without any edging whatever.

2. *Pondederia cordata*, *Sagittaria variabilis*, *Sarcocolla purpurea*, *Lobelia cardinalis*, *Arundo Donax*, *Eulalia Japonica*, etc., are suitable for rock-work around a fountain.

3. Tender Water-lilies should be taken up before winter, planted in a sufficiently large tub, and placed in a cellar free from frost. Or they may be left in the tub the year round by simply placing them under water in summer, and in the cellar in winter.

4. Several of our native Ferns are very handsome, and, if not convenient to bring them from the woods, may be obtained from most nursery establishments.

TRADE NOTES.

ITEMS OF GENERAL INTEREST FROM THE SEED, NURSERY AND FLOWER TRADE ARE SOLICITED.

Mr. Peter Henderson has gone to Europe for a well-earned vacation.

T. E. McAllister has moved from 31 Fulton Street, New York, to 22 Doy Street.

Hance & Borden have moved their New York office to 22 Doy Street, along with Mr. T. E. McAllister.

T. W. Wood of Richmond, Va., has a rapidly growing seed trade in the rich James River Valley and other parts of the South.

Phineas B. Hovoy, for some time probably the oldest living seedsman in the United States, died at Cambridgeport, Mass., recently, aged 82.

C. A. Reeser of Springfield, O., has had a good season. He says that advertising in one season fully doubled his sales. He believes in THE AMERICAN GARDEN.

The genial Albert McCullough, of J. M. McCullough's Sons, Cincinnati, O., reports an increasing trade. Their Onion-set department is especially flourishing: in this they have few if any equals.

Albert Williams of Sharon, Pa., advertised in THE AMERICAN GARDEN and experienced a prosperous season. He had proposed to advertise more extensively but his small advertisement sold his stocks out close.

O. K. Gerrich of Portland, Me., has established a nursery at Geneva, N. Y., where it is said he has excellent stocks. His trade is increasing in spite of the depression in business: a good sign of his standing as a nurseryman.

Hiram Sibley & Co., Rochester, N. Y., say they have considerably increased their catalogue trade over last year. Mr. Sibley, in his eightieth year, is still quite well and strong, though suffering from rheumatism, which interferes with walking.

Our old friend Joseph Harris of Rochester, N. Y., has changed his business by forming the Joseph Harris Seed Co., and it is hoped has united with himself a business manager who will relieve him from the too hard work he has been doing the past few years.

A. C. Nellis & Co., Canajoharie, N. Y., had trouble with their mail. Setting a detective to work on the case, he discovered that a post office clerk had been systematically robbing their mail for some months previous. This explains the complaints they had received from customers who had sent them money, but got no response thereto.

Messrs. Brackner & Evans, 422 West Street, New York, gave last month a private exhibition to their friends and patrons. The commodious warehouse was tastefully fitted up for the occasion, and everything displayed to excellent advantage. The center of attraction was their new artificial hatcher, which appeared to do its work to perfection. In addition to this were innumerable improved contrivances and conveniences for the poultry yard; also bait-stud dog houses and kennels, with improved and very convenient appliances for keeping and rearing dogs; also a great many patterns of fencing and ornamental works for the lawn, garden and farm.

This method of bringing goods to the notice of buyers through private exhibitions, is an excellent one, and will no doubt be more generally adopted by manufacturers and merchants.

We are thinking about permanently enlarging this magazine, beginning next January, and increasing the subscription price, so that all who subscribe now may make a decided gain by so doing.

THE GREAT CALIFORNIA INSECT POWDER.

Perfectly Harmless to Animal and Plant Life. Manufactured from the pure Pyrethrum Cinerariæ Folium Blossoms grown by us in California, where "Buhach" is Manufactured and Canned.

BUHACH has been carefully experimented with and has received the unqualified endorsement of the most eminent scientists and entomologists in this country, among whom we quote: Prof. C. V. Riley; Prof. A. J. Cook; Prof. Matthew Cook, late Chief Horticultural Officer of California; W. A. Henry; Elbert S. Carman, Editor "Rural New-Yorker," New York; A. S. Fuller; Dr. F. M. Hexamer.

The Dreaded Rose-Bug, Impervious to Paris Green and all other Arsenical Compounds, gives up the ghost to BUHACH.

BUHACH POWDER will kill Rose-bugs. Last year it was blown upon them through bellows. This year we propose to use a Buhach extract, made by dissolving four ounces of the powder in a gill of alcohol and nozzle. We do know that Buhach will kill cabbage worms and the dreaded rose-bug.—Rural New-Yorker, April 25, 1885.

CABBAGE WORMS AND POTATO BEETLES. Prof. A. J. Cook says: I found Buhach efficient in destroying the Colorado potato beetles, the caterpillars of the cabbage butterfly and plant lice.

SLUGS, CATERPILLARS, GRUBS, ETC., ETC. I find it very fatal to slugs, caterpillars, grubs, flies, mosquitos, and both parasitic and plant lice.—A. J. Cook, Entomological Laboratory, Agricultural College, Lansing, Mich.

BUHACH, Safe and Sure Insecticide. I have been surprised by the effect produced on the hairy Tent-caterpillar by water containing the extract of 1 lb. of powder to 50 gals. They paid little attention to the bellows and powder, at least when the wind blew; but a sprinkle of the diluted ex-

tract promptly caused them to squirm, drop off, and finally die while attempting to crawl away.—E. W. Hilgard, University of California.

THE CURRIANT WORM. Buhach, extended with plaster 50 times, kills the currant worm.—Rural New-Yorker.

DR. F. M. HEXAMER says: The efficacy of Buhach is so well known that its value as an insecticide is firmly established. We have lately experimented with it, and were highly pleased with the results. If properly applied it accomplishes all that is claimed for it, and has the great point in its favor that it is entirely harmless to human beings, as well as to house and farm animals.

MR. A. S. FULLER, Agricultural Editor "New York Sun," says: Some large climbing roses that were badly infested with aphids and thrips were entirely cleared of their enemies by one dusting with BUHACH.

BUHACH is also an Absolute Specific for all insect pests of the household, such as Flies, Fleas, Mosquitos, Bed-bugs, Roaches, Water-hugs, Ants, Moths, Midges, Crickets, Spiders, Scorpions, etc., etc.

PRICE OF BUHACH.—25 cents, 50 cents, 75 cents and \$1.25, according to the size of cans. Insufflators, 25 cents each. Sent by mail, post-paid, on receipt of price. Buhach is sold by Druggists, Grocers, Florists and Seedsmen out of our 6 lb. cans at \$1 per pound, or \$4.50 per can of 6 lbs. Force Pump with ten feet of pipe and ten feet of rubber hose and one Cyclone spray nozzle, complete, ready for work, price \$9.00. Extra Cyclone nozzles, each 75 cents. Bellows with attachments for dry applications, \$2.00. Bellows with atomizer attachment for applying Buhach solution, \$2.00.

If Buhach is not on sale in your neighborhood, send your orders direct to us. Be sure you get "Buhach" and that the can is an original package. Many dealers will insist on your trying "something better" or "as good." Don't take it. Stand firm, and use nothing but "Buhach."

Send for circulars, mentioning THE AMERICAN GARDEN.

BUHACH PRODUCING & MFG. COMPANY, 154 Levee Street, Stockton, California, and 49 Cedar Street, New York City.

Vol. VI.
Old Series, Vol. XIII.

AUGUST, 1885.

No. 8.

COPYRIGHT 1885: BY E. H. LINDY.

The Vegetable Garden.

SEASONABLE HINTS.

At this season of the year, the skill and good management of a gardener will show themselves in the condition of his grounds plainer than at any other time. While in a well-managed garden every foot of ground is occupied with useful or ornamental plants, and second and third crops follow the previous ones in quick succession, in far too many instances, decaying stalks and vines and rank weeds are the only occupants of the land made vacant by the removal of early vegetables.

Clean Culture.—To those who have never tried it, it would seem wonderful how much a small piece of ground can be made to produce with clean culture, and how much easier it is to destroy weeds in their nascent state than after they have taken possession of the entire ground. But the object of cultivation is not only the killing of weeds; the loosening of the soil is of not less importance. Loose soil forms the best possible mulch and safeguard against drought. The careful cultivator finds rarely any weeds to kill, but stirs the ground frequently because he knows that by so doing he benefits his crops.

Thinning Roots of all kinds, Carrots, Parsnips, Beets, Turnips, etc., is, next to rich soil, the most essential condition to success in their culture. To crowd half-a-dozen roots into a space that affords room and nourishment for one only, is about as reasonable as to turn six times as many cattle into a pasture as there is forage for.

Raising Seeds.—When one has an unusually good strain of certain kinds of vegetables which it is desirable to retain, the wise thing to do is to save some seed for future use. But to gather the leavings of Peas, Beans, Corn, etc., for seed, is not perpetuating a valuable strain, it is, on the contrary, a sure way to deteriorate it from year to year. Only the best and earliest seeds should be saved for sowing.

This is not an easy matter in an ordinary garden, unless separate plots are set aside for seed-raising exclusively. It is for this reason that seedsmen's seeds, which are the entire products of the crops, are, as a rule, better than those saved from the private gardens.

Peas and Beans of early varieties may still be planted; it should be remembered, however, that all seeds sown in midsummer have to be covered deeper than in spring. Deep planting defies drought, produces larger yield and promotes continuance of bearing; six inches is not too deep for Peas, provided there is sufficient depth of soil. It would be folly to plant seeds into a sterile sub-soil.

Winter Radishes make an excellent relish for winter use. The seed may be sown at any time this month. The treatment is the same as that for early Radishes, but to insure crisp and tender roots, deep, rich, mellow soil is still more essential. The Rose-colored China is the variety most frequently seen in our markets, but for home use we prefer the California Mammoth White. Packed in sand they keep all winter.

SOME NEW AND OLD LETTUICES.

The different sorts of Lettuce show a wide range of variation, and one finds difficulty in believing that all can belong to the same species. The Deer Tongue has distinctly lanceolate leaves, two or three times as long as broad, with a long, pointed apex, and nearly entire unvarved borders. The Green Fringed has leaves decidedly broader than long, with a finely dentate and intricately ruffled border. Between these two extremes, we have varieties exhibiting almost every possible shade of variation. These multifarious varieties almost always come true from seed, even when the sorts from which the seeds were taken were grown in close proximity. In other words, the varieties do not seem to self mix to any great extent. I have seen no evidence of cross-fertilization in upwards of 50 varieties, grown from seed of my own saving, except when I intentionally crossed two sorts.

Although there are many varieties of Lettuce that are truly distinct, the names printed in the catalogues are usually far more numerous than the varieties which they represent. Of the sorts grown in our Station garden, about 150, I have collected more than 700 different names. I will describe a few of the more interesting varieties.

THE DEACON.—All in all, this is the finest heading variety we have grown. Introduced by Joseph Harris. This is one of the dark-green, thick-leaved sorts, nearly all of which are of good quality. Head compact, roundish or a little flattened when of full size, and in some plants measuring fully five inches in diameter. Outer leaves few in number, which with the perfectly defined head give the plant a very distinct appearance. Mr. Harris writes me that he procured the seed of a Mrs. Miller, residing near Rochester, a woman who came to be widely known as a grower of fine Lettuce. I have been surprised that this truly superior variety has not appeared under any other name.

WHITE CHAVIGNE.—An excellent heading sort, probably of French origin. Thick-leaved, deep green; frequently forms compact heads five inches in diameter: quite different from The Deacon, as it is low and spreading in habit.

LARGE WHITE STONE SUMMER.—Another superior heading Lettuce, to which there are, including foreign appellations, more than a dozen different names. Among these are Hardy Honey, Large Green, Large White Cabbage, Late White Cabbage, Princess, Royal Cabbage, Saxony, Sugar, very Large Yellow Paresseuse and White Cabbage. Foreign names, French: Laitue blonde d'été de Saint Omer, Laitue grosse blonde paresseuse. German: Gelber Paulenzer Lattich, Grosser gelber Dauer Kopf-Lattich, etc. I have not verified all of these synonyms. Several I give on the authority of M. Vilmorin of Paris and Mr. Robert Thompson of England. This is a thin-leaved, yellowish-green variety of very large size, which sometimes forms a head six inches in diameter. Both this and the White Chavigné may head as well as The Deacon, but owing to their more numerous outer leaves, they are less attractive in appearance.

THE BERLIN, of which there seem to be at least 14 different names, is also an excellent heading sort, though its heads are not as large as those of the three described above.

The following names have been given to this variety:

All The Year Round (black seed), Berlin White Summer, Black-Seeded Satisfaction, Black-Seeded Yellow, Fine Imperial Cabbage, Leyden White Summer, Salamander, bage, Satisfaction Black-Seeded. Foreign names, French: Laitue blonde à graine noire, Laitue blonde de Berlin, Laitue blonde de Tours, Laitue royale à graine noire. German: Berliner gelber Kopf-Lattich, Grosser gelber Berliner Lattich.

THE GOLDEN SPOTTED is desirable for later use, as it is very beautiful in appearance, of excellent quality, and very slow in running to seed. It is not of large size, but heads well. Its leaves, which are very thin, present a beautiful mingling of golden green and brownish red.

PELLETIER.—This is a very peculiar Lettuce and is almost attractive enough for the flower-garden. The borders of the leaves are deeply cut into long, pointed lobes, of which the edges folded together below cause the apex to point upward, giving the plant a very singular appearance. It forms a compact, pointed head of medium size.

RED BESSON.—Synonyms: Marvel, Merveille des quatre saisons. This is a deep, glossy, red variety; the only red variety of my acquaintance in which the color is sufficiently bright to make it attractive. It is a Cabbage Lettuce having densely blistered leaves and it forms a compact head of large size, that remains a long time even in hot weather. The red Lettuces are not generally esteemed for the table, at least not in this country, but I think this one of the best of them.

DEACON HINE.—This variety sent out by Messrs. Ferry & Co., is entirely distinct from The Deacon of Mr. Harris. It is a very low, spreading, compact growing Lettuce, of which the thick, dark-green leaves overlap one another like the shingles on a roof. I judge it is of excellent quality though it does not form a clearly defined head.

I have found nothing better for culture in frames than the well-known White-Seeded Tennis Ball. Landreth's Forcing, which closely resembles Dippe's Emperor, sent out by Dammann & Co. of Italy in 1883, is also an excellent forcing variety.

Almost every season some of the old varieties are offered to the public under new names. The present year I note that the Rochester and Hubbard's Market Lettuces and the new Premium Cabbage seem to be nothing more nor less than the old White Summer Lettuce, or All the Year Round white seed. The New Perpetual is to all appearances the well-known Early Simpson; the New Silver Ball is undoubtedly the White Parm of Vilmorin, and the New Stubborn-Headed is apparently the old Berlin Lettuce. The New Orleans Cabbage sent out in 1881, seems to be the old Turkish or Butter Lettuce. These are all excellent varieties, but they are not new, as one would suppose from the catalogues. "E.L.M."

New York Agricultural Experiment Station.

A handful of bran sprinkled over heads of Cabbage when the dew is on, is recommended us as an infallible remedy for Cabbage worms.

VARIETIES OF SWEET CORN.

From the description given in catalogues it will often be found difficult to form an accurate idea about the relative sizes of the different varieties of Sweet Corn. The accompanying illustration, from the catalogue of Messrs. Peter Henderson & Co., will be found a material help in this regard.

CELERY GROWING.

We cannot boast of as good natural advantages for the growing of this crop as those enjoyed by the Michigan growers, especially those about Kalamazoo, yet nevertheless no small amount of Celery is grown round about this city (Quincy, Illinois). The growers are now preparing to transplant the seedlings. As the raising of the seedlings is quite troublesome, some of our most extensive growers buy all their plants. As they can buy of near neighbors, they get the plants at a reasonable price, and one which probably justifies them in buying plants instead of raising them from the seed.

Manure is used liberally—although the land is naturally very fertile—and well incorporated in the soil, which is thoroughly fined. The ground is left level, and the plants are put out on the surface, as Cabbages, etc., are planted. For Celery for fall use the plants are put six inches apart in rows four feet apart; for winter Celery the rows are

made only two or three feet apart. In transplanting, it is important to get the plant set to just the depth of the roots; also, to firm the ground about them—but this latter applies to all plants. This work is done from July 1st to August 15th. The evening is the best time for transplanting, and if there has just been a copious shower it is all the better for the plant but not so pleasant for the planter. If there has not been a shower the plants are given a copious watering, and but a very small proportion fail to continue growth.

The cultivation is easy—to keep the ground clear of weeds is all that is required. Horse hoes are used, any weeds growing where the hoes will not reach them being removed by the hand hoe or by pulling. Cultivation is thus kept up till about the first of September, when "handling" begins. The earth is drawn to the row from each side—a hoe is commonly used for this work—and pressed

firmly against the plants to give their leaves an upward growth and thus fit them for banking. But as it is rarely safe to leave winter Celery in the ground here, none but that designed for fall use should be banked.

Banking is done about two weeks after handling is completed—say October first. The soil between the rows is dug up and banked up solidly against the rows of Celery, being compacted in its place by the back of the spade. In four weeks it is blanched ready for use. If left in the ground till late the bank is made stronger, and a foot-thick layer of litter is also packed against it.

For winter-keeping our growers utilize all their spare cellar space. The Celery is taken from the ground from the last of October to the last of November—to give a succession—and placed in narrow boxes not quite so deep as the Celery is high. Sand or rich soil to the depth of two or three inches is placed in the box and the Celery is packed

spade blade are dug as deep as the Celery is high. In the trenches the Celery is packed compactly, standing upright, as in the boxes or compartments in the cellar. As the temperature lowers, litter is placed over the Celery, the litter being increased as the weather grows severer. A covering of litter eight to ten inches thick will protect the Celery from any ordinary weather. Some place a very light covering of earth over the litter. As thus grown and blanched our gardeners find Celery one of their most profitable crops. Golden Dwarf and Sandringham are the two varieties mostly grown here.

JOHN M. STALL.

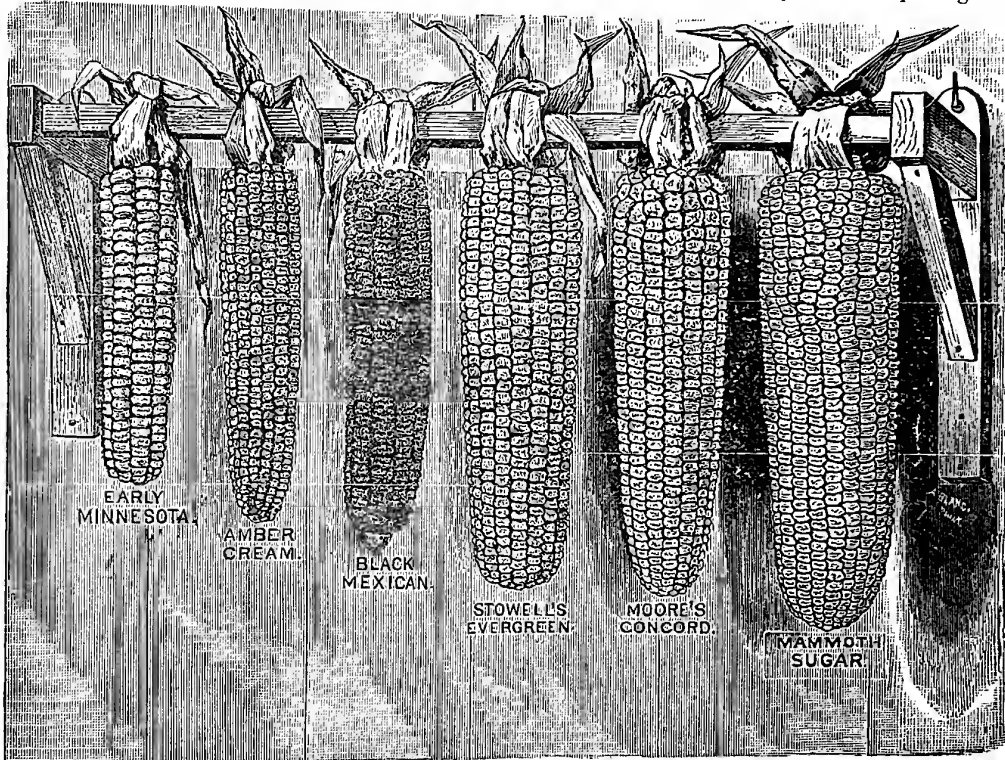

FRESH SPROUTS.

The average yield for three years of whole Potatoes planted at the Ohio Experiment Station was 246 bushels per acre, that from single eye pieces 130 bushels per acre.

To prevent the splitting or bursting of Cab-

bagges, J. J. H. Gregory recommends to go frequently over the ground and start every Cabbage that appears to be about to mature, by pushing them over sideways. Heads thus started are said to grow to double the size they had attained when about to burst.

Cabbage maggots are very numerous and destructive in many localities. Of the several remedies tried at the New York

VARIETIES OF SWEET CORN.

Experiment Station, the kerosene emulsion, prepared as follows, has been found most effective. One pound of common soap is boiled in four quarts of warm water; when all is dissolved and while the suds are boiling they are removed from the fire. One quart of kerosene oil is then added and thoroughly mixed by stirring vigorously until the mixture is cold. One pint of this emulsion is dissolved in ten gallons of hot water and applied to the roots of the plants.

Melons do not require frequent change of land. The veteran Marshall P. Wilder says that he has grown Melons on the same land for ten years; the ground has a south aspect. He prepares a compost of manure, soil and guano, which he spreads on the land in addition to manuring in the hills. Surface manuring he considers very important. He has no trouble with insects, as he gets up in the morning before they do.

upright on this sand or soil, the roots being set on it but none of it allowed between the stalks. The cellar is kept cool if the weather is warm, as it very frequently is when the Celery is first boxed. It is ready for use early in the succeeding year—say from January first to April first. Some set the Celery down on the earthen floor of the cellar, placing it in narrow compartments made by putting on edge, a few inches apart, boards about as wide as the Celery is high. Some growers have "Celery houses"—low houses banked up around the sides with earth and a floor of earth—the bottom of an excavation two feet deep—divided into narrow compartments by boards on edge; but so far these houses have blanched the Celery only fairly well.

Those who have not the Celery houses trench when their cellars are filled. High ground, perfectly drained, is selected. Trenches the width of a narrow shovel or

The Fruit Garden.

SEASONABLE HINTS.

"Do you advise summer or spring planting of Strawberries?" is the essence of several letters before us. This is one of those questions which cannot be answered unqualifiedly, as each system has its advantages.

Presuming that there is already a thrifty, clean Strawberry bed on the place, from which a fair crop may reasonably be expected next year, it will make little difference in the final results whether plants are set out now, or in the fall, or next spring. But when there are no Strawberries at all on the place, or, the old plants have been killed by frost last winter, then we would decidedly advise to plant at the earliest moment practicable.

Potted Plants have many advantages over ordinary layers for summer planting. "Potted plants are a humbug," some all-knowing ones will say. Poor potted plants may be worthless, to be sure, and a fraud—that is, the nurseryman who palms them off for good ones—but they are no more a humbug than flour is a humbug because the last barrel bought from the grocer was musty or sour.

Plants that are pot-bound, or such as have not yet formed a good ball of roots, are certainly not to be recommended, but with good, well-rooted plants failure is hardly possible. If properly taken care of they will produce as large if not a larger crop of berries next season than is obtainable in any other way. The principal objection that can be made against them is that, when they have to be procured from a distance, the cost of transportation adds considerably to their cost.

Fruit Trees, as a rule, receive too little attention at this season. Sprouts that spring up around the trunks of trees may be done away with now more effectually than at any other season. The soil should be dug away around them, and the shoots cut clean away at the starting point; thus treated few will come again, while when cut off in spring in the usual manner, they will only start again more vigorously.

The Codling Moth, although not native to our country, is increasing at a frightful rate. The female moth deposits her eggs, about fifty, singly in the blossom end of the Apple, just as it is forming generally. The egg hatches in about a week, when the young worm at once works its way to the core of the fruit. After reaching maturity it leaves the fruit and seeks a hiding place where to spin its cocoon, generally under the loose bark and in the cracks of the tree. Some of the larvæ escape before the fruit drops, but a great many of the unripe Apples found on the ground still contain the larvæ, and in this we have the easiest and surest remedy for this pest. By picking up every few days all the fruit dropped, and feeding or burning it, great numbers of worms may be destroyed.

Mildew on Grapes usually makes its appearance this month, especially on thin-leaved varieties. Dusting the affected vines with "flowers of sulphur" is the best remedy. It should be used at once as soon as the first signs appear, and not only on the affected parts, but over this entire vines. Sulphur bellows, made for the purpose, are the most convenient for applying this powder.

THREE STRAWBERRIES.

Three new Strawberries have so far been entered for THE AMERICAN GARDEN prize: The Jewell, by P. M. Angur of Middlefield, Conn.; the Parker Earl, by Jno. T. Lovett of Little Silver, N. J.; the No. 5, seedling, by J. G. Bubach of Princeton, Ill. Each of these varieties has made an excellent record so far, and we hope that one of them at least will surpass anything now in cultivation in any country.

But there should be a score of new sorts in competition for this prize, and we doubt not that more will come forward in due time. We seek to stimulate the production of more valuable varieties, to the end of benefiting the entire fruit-growing public.

There is plenty of room for improvement, so long as it is openly claimed in many quarters that there is now no better market berry than the Wilson, while others hold up the Sharpless as supreme. Yet few people claim even a preference for the Wilson for quality, and the Sharpless in many gardens is very inferior in ripening, is hollow and pulpy, and gets soft quickly. Yes, there is plenty of room for effort in the production of new varieties while Wilson, Crescent, Champion, Sharpless and other inferior kinds hold prominent place.

THE GOOSEBERRY.

Until recently our fruit-growers have given but little attention to Gooseberry Culture, finding that varieties that are grown to perfection in the moist, cool climate of England could not be successfully cultivated under the influence of our dry and hot seasons. Mildew and sun-scald affected seedlings of these sorts; in like manner, in consequence of which fruit-growers had given up the matter and reconciled themselves to the only three native varieties under general cultivation here.

The older of these, Houghton Seedling, is a direct descendant of our common native species and originated in Massachusetts; the other two are the Downing and Smith's Improved, which are seedlings of the Houghton and are excellent sorts; but there is no reason to doubt that we may yet see much improvement over the best of these, at least we should not be content without making steady and constant effort with that in point of view by experimenting.

The Industry, a variety recently introduced, although of foreign origin has thus far given very flattering results. Its ability to withstand the vicissitudes of our climate in various sections has, however, yet to be fully established.

Several other seedlings of large size are under trial in various parts of the country, so that among all these on-coming new sorts we may reasonably expect some improvement, and perhaps a real "bonanza" will be discovered.

In England the Lancashire weavers have for many years held a reputation for raising the largest and finest Gooseberries that the country affords. A pamphlet published each year at Manchester gives a list of the prize sorts and other information. A list of 700 prize varieties is given in Lindley's "Guide to the Orchard."

In favorable seasons with extra care some of the English sorts, such as Whitesmith and Crown Bob, may be grown in this country.

They should be given a somewhat moist and partly shaded location, a light mulch applied, and if mildew appears, a frequent but light application of flowers of sulphur may check it somewhat.

For our native kinds the common Currant-worm is the worst enemy, but may be easily squealed by an application of pure hellebore, either dusted on or by mixing with water—about one oz. per pailful, and applying with a garden sprinkler. After the fruiting season is over, or in young plants not yet in fruit, a dry application of slug shot is cheaper, more easily applied and just as effectual. Bubach is equally effective.

W. H. RAND.

APPLES FOR NORTHERN NEW ENGLAND.

A farmer in northern Vermont, allured by the tree-peddler's picture book, planted a large orchard of Baldwin, R. I. Greenings, and Northern Spy's. Now he wishes that he had planted Wealthy's and other Apples of Russian origin, or descent, instead, and that the peddler had never crossed the State line. But he has one advantage over his Connecticut brother, mentioned on page 145 of the JUNE GARDEN. His trees are all dead to the ground, and he has only to begin again without any incumbrance on his grounds, or any temptation to delay.

MORAL, in both cases:—An intending orchardist should seek instruction in the business elsewhere than from tree-peddlers; and should understand that as "what is one man's meat is another man's poison," so the selections for orchard planting in different sections of this vast country are necessarily as different as the sections. Here is a list for northern New England, which does not include a single variety now grown in southern New England and New York, yet every one of them is the equal, in its season and use, of the best fruits of like season and use in that section.

SUMMER: Yellow Transparent, Grand Sultan, Charlottenthaler, Tetofsky.

AUTUMN: Switzer, Peach of Montreal, St. Peter's Prolific Sweeting, Duchess of Oldenburgh, Golden White.

WINTER: Wealthy, Scott's Winter, Newport Winter Sweet, McIntosh Red, Giant Swan (of Minnesota).

In addition, we have on trial the following most promising Winter Russians from the importations of the Iowa Agricultural College:—Longfield, Antonovka, Anis, Titovka, Arabskoe and Bogdanoff. These Russian and "iron-clad" Apples have their place, and a big one, in these United States.

DR. T. H. HOSKINS.

QUALITY AND QUANTITY IN STRAWBERRY CULTURE.

High quality of fruit generally implies a weakened growth of foliage accompanied by a lack of vitality. Quantity causes a similar defect, through over-taxation of the foliage. Varieties noted for productiveness "run out," as is said, after a few years for want of foliage. Most of the new varieties of the day fall in this particular, so that among originators of new varieties it is a well recognized fact that foliage gives way to fruit in the Strawberry. Foliage becomes the important thing to preserve in successful culture. Not too dense a mass, nor of too feeble a growth. In the one case the berry

will not set well; in the other sun-scald and defective ripening will result.

To preserve the foliage in the so-called now and improved varieties as much as possible, the soil should be of firm texture, the culture should be not over half an inch deep; in garden cultivation the hoe and rake only should be used. In loose soil the roots extend until they reach more compact strata, and the foliage will not increase in vigor as long as the roots are growing in length. Where a vigorous growth of foliage is made

THE MAY KING.

in light or loose soils, unless the variety planted is one of exceptional vigor in foliage, the ground has to be made unduly rich, forcing an unhealthy state of foliage and inducing liability to disease in the plant.

Whether single stool or matted bed culture should be adopted, naturally depends on the state of the foliage. Many varieties, Jersey Queen, for illustration, in firm soils will make such heavy foliage in single stools as to prevent the proper setting of the berries. Here the plants are allowed to run to matted beds, thus diminishing the excess of foliage. Take the same variety in a loose or lighter soil, even in single stools, and the foliage will change so as to give the best results;

THE HENDERSON.

in this case no runners should be allowed. Some varieties are noted for a scarcity of foliage in some localities. The Sharpless with me, no matter what culture it receives, produces not over five leaves and has therefore to be grown under the matted bed system to protect the fruit from sun-scald.

Take the much abused and berated Great American Strawberry and you have a variety illustrating the effect of foliage on fruit. This much-talked-and-written-of-variety under proper conditions has the best of

foliage, and produces wonderfully. Yet the novice in Strawberry culture can never grow it successfully. The least deviation from the correct method of culture is sure to result in failure. Except with late, fall-set plants, I have never seen success in other than matted beds.

I know of no berry that combines quality, productiveness and general healthy growth in so great a degree and proves satisfactory under almost any kind of culture, as the Prince of Berries. It is among the better varieties what the Wilson is among the poorer. The primary class of cultivators will probably continue for some time to cling to the Crescent, Wilson, Champion and other varieties low in the scale of quality, but, unless all signs fail, the Strawberry of the future must combine quality with quantity to make it acceptable to a discriminating public.

J. B. ROGERS.

SOME OF THE NEW STRAWBERRIES.

May King.—Has ripened this year in advance of Crescent and Crystal City, so that it may safely be accepted as the earliest large variety in cultivation. It is bright scarlet, large and of good quality. Flowers perfect, plants healthy and vigorous.

Henderson.—This is one of the very best

THE PRINCE OF BERRIES.

flavored varieties we are acquainted with, combining rich flavor with pleasant sprightliness. The fruit is large, elongated conical, with neck, and of dark color; plants large and productive.

Prince of Berries.—This is by many considered Mr. Durand's best seedling, and it is in reality a superb berry, large, roundish, of light scarlet color, and of highest quality. On Mr. Durand's grounds it is actually wonderful, but it succeeds also over a wide range of country. The plant is a good, strong grower, and very productive; flowers perfect.

Parry.—A seedling of Jersey Queen, raised by Wm. Parry. Berries very large, obtuse conical, bright, glossy crimson, and of good quality. It is immensely productive; foliage remarkably vigorous and healthy; flowers perfect.

Cornelia.—A late, firm berry originated by Matthew Crawford. It is of good, medium size, conical, light crimson, and of good quality. Plant large, stocky and healthy. Its extreme lateness and firmness make it a valuable variety for northern markets.

There is "a good deal of Strawberry" about this issue of THE AMERICAN GARDEN, and we shall have some striking good things to present on the same fruit next month.

SHORT OUTTINGS.

The Sharpless Strawberry in adjoining gardens in Greenfield behaves quite differently. The soil in both is clay, but one has had more sand applied and that gives much the finer berries.

The canker worm is destroying entire orchards in several localities. Spraying the trees with a mixture of one ounce of Paris green and ten gallons of water is a sure remedy for the pest.

THE PARRY.

Although it is not possible to give definite rules about the distances to which fruits should be thinned, about four inches apart for small and medium-sized fruits, and five to six inches for large ones, will be found a good standard for the different sizes.

Chicago and the other large western cities have been unable to consume the immense crop of Strawberries raised in the Mississippi Valley this year; in consequence thereof Bostonians were treated to the novel sensation of having Illinois Strawberries offered in their markets.

Of the older varieties of Strawberries, J. H. Hale finds Manchester at the head yet,

THE CORNELIA.

closely followed by Windsor, Miner and Crescent, in the order named. Mrs. Garfield is superb this season, and Daniel Boon is giving a big crop of fine-looking fruit, but it is of rather inferior quality.

The Strawberry box presented substantially the same appearance this year that it did last season, observes the Market Journal, except that the bottom was a little nearer the top and the top a little nearer the bottom. The top and the bottom become closer friends every year.

The Flower Garden.

TO A DANDELION.

Little mimic of the sun,
Hiding in the fragrant grass,
Have you any kisses won
From the pretty maids who pass?
When the sun slips down the west
Some fair girl shall come in quest
Of the secret which you look
In your tiny golden breast;
You shall hear an airy knock,
And a question: What o'clock?

At the very verge of night,
When the summer twilight's breath
Makes you dizzy with delight,
Dance in happiness to death:
When the peaceful moon shall peep
Down from star-lit skies that weep
Tears of sweet, delicious dew,
Tender, gracious eyes shall keep
Quiet company with you
'Neath the heaven's cover blue.

Ah, you dainty, snowy ghost,
See what bliss your wisdom brings!
Tell me, pray, what angels boast
Such a zephyr for their wings?
Just because the hour you tell,
She repays your magic well,—
Waits you off to paradise;
Sounds for you a gentle knell;
Lights your journey with her eyes:
Would that I were half so wise!

—Frank D. Sherman, in *Outing*.

SEASONABLE HINTS.

Pansies.—The great favor in which the Pansy is held by all true lovers of flowers is natural enough, for there is no other flower that can compare with it, in its sweet, fascinating loveliness, and none that may be had the year round with so little trouble. If confined to the growing of but one kind of flowers, we think we should choose the Pansy.

To have a brilliant show of flowers all next spring and early summer, seed should be sown from the middle to the end of this month. When a cold frame is available, this is the best place for the purpose, otherwise, any sheltered, dry spot, made rich with decomposed manure, will do. A bed of a yard square is amply large enough to furnish all the plants required for a private garden.

After spading and leveling the ground, the seed should be scattered broadcast, covered lightly with firm soil—or sand, if the natural soil is heavy, and pressed firmly with a board. No more care is necessary during the remaining season than is given to seedling annuals and perennials. During winter a light covering of leaves and brush should be given.

Early in spring, so soon as the permanent bed can be made ready, which should be done by making the soil deep, rich and mellow, the seedlings have to be transplanted to it, about eight to ten inches apart.

For fall-blooming, sow in early spring, and transplant to a partly shaded position. But it is useless to expect good flowers from poor seed; better pay a liberal price for the best than accept poor seed as a gift.

Decaying Flower Stems of all kinds of plants should be cut down, and the beds kept as neat as possible. It is a poor plan to allow any plants to bear seed which is not wanted for use, as seed-bearing is far more exhausting than the production of flowers.

CHRYSANTHEMUMS IN POTS.

The plants should be in their blooming-pots by the first of August, if wanted for exhibition. If they have been well grown from the start they may now be shifted into 12-inch pots, though it is seldom necessary to use larger than 10-inch, and very handsome specimens may even be grown in several sizes smaller. When the pots are full of roots, give liquid manure twice a week, and when the buds begin to appear, if large flowers are wanted, thin them to a single bloom on each shoot.

I never had satisfactory success with Chrysanthemums grown outside and lifted for potting after the buds had formed, but never failed to get fine flowers by growing in pots all summer. Few people know the full beauty of well-grown Chrysanthemums, and it is to be hoped that the present fashion for them will lead to good results. C. A.

THE BEST WHITE ROSE.

To an inquiry of one of our readers for the best White Rose, Mr. A. Schultzeis, the well-known Rose grower, replies: Merveille de Lyon, introduced a few years ago, is the best white out-door Rose I am acquainted with. It may be termed an improved Mabel Morrison, but of purer white, more double, and with firmer petals than the latter. The buds are beautiful in form, resembling Baroness de Rothschild, but fuller. The flowers retain their beauty a long time, and, when fading, the inner petals become tinted with salmon, or rose color. After being cut the buds may be kept in good condition for several days, even in warm weather. The growth of the plant is similar to Baroness, only more robust, the stems are less thorny, and the blossoms appear singly on the branches. Taking all points together, I do not know of a more desirable variety, especially for cutting.

Next best I consider Elise Boelle. This is a lovely Rose, white, delicately tinged with pink, of medium size, double, and of circular form. The wood is light green, and beset with numerous small spines.

PORTULACAS.

The Portulaca, by its creeping habit, covers, when well-grown, a foot or two of space so thickly as to hide the ground under its fleshy leaves. Its flowers are of many colors: rose, crimson, purple, white and yellow, and many are striped and splashed in brilliant combinations. A bed of it is a most gorgeous sight on a hot summer day. It is a great lover of heat, and flourishes luxuriantly when all else suffers from drought. It likes a light, warm, sandy soil, with full exposure to the sun, and low beds on the lawn. It is unequalled among annuals. It is a profuse bloomer, and usually covered with flowers the entire summer.

Most varieties are single, but of late years double ones have been produced, resembling little Roses, and preferred by many for the beauty of the individual flowers, though the single ones are quite as showy and useful for masses of color. The seed sold as that of the "double" Portulaca has produced with me about ten per cent of double flowers, so that one cannot depend on getting double flowers, even when the seed has been gathered from such.

E. E. REXFORD.

THE CLEMATIS.

For as long as I can remember, the *Clematis Flammula* has been a widely-known favorite among us, and it is likely to remain so. Its hardiness and rapid growth, its numerous pretty white flowers and grateful fragrance, have won for it a love among the masses which is not likely to be soon superseded even by the larger and gayer flowers of more recent introduction. Even our native Virgin's Bower (what a pretty name that is) often finds a place trained over the simple "stoop" of the old farm-house and on more pretentious verandas. After a while we had *ecerulea*, *Sophia*, *Helene*, and others; but perhaps the Clematis that has done most to make the later forms grown is *Jackmani*. It is to-day, according to my observation, the most widely grown of all, with the possible exception of *C. Flammula*.

The Clematis ranks among the most useful and charming of climbing plants. It is easily grown, and is at home in a variety of soils, but thrives best in a loam of some body; it is a rapid grower, and quickly covers a large space; it embraces a pleasing variety of color; it is equally well adapted to covering a veranda, trellis, or out-buildings, and may be used in large beds or for covering rocks; and, not least, it is hardy, the latest introductions having passed through the last trying winter unharmed in this latitude.

There is this to be said, however, in regard to its hardiness: while a very rich soil produces the largest flowers and the most luxuriant growth, it has a tendency to make the plant more or less tender. Where the winter is generally severe, therefore, the plant should be grown in a soil only moderately enriched. It may be stated in this connection that the Clematis will also grow and bloom very well in a light, sandy soil, with flowers, however, diminished in size. Its accommodating nature in this respect adapts it to a wide extent of country, and it may therefore, in a sense, be claimed as a plant for the multitude.

It has generally been thought that the beautiful varieties that have been introduced during the past ten years or so are tender, and this has deterred many from planting them. I have tested the majority of the new kinds, and have found them to be quite hardy, and I therefore unhesitatingly advise the readers of THE AMERICAN GARDEN to plant them. I believe there are very few, if any, that will not endure our coldest winters.

In regard to the time to plant, it may be done either in the spring or in the fall. I prefer, however, to plant early in the spring, though I have planted in the fall with about as much success as in the spring. Much depends upon the condition of the plants. Last fall upwards of 50 varieties were planted on the second of December, and only one failed to appear this spring, the rest not only making a fine growth, but some of them a fair show of flowers. So much for the hardiness of the newer varieties of Clematis.

Plants may be bought grown in pots or grown in the open air. The former are to be preferred, if not too large. In the spring plant early, before much growth has been made. In the fall, plant late, or as soon as the wood has ripened. Pot-grown

plants are best, at least for inexperienced planters, and the plants, of whatever kind, are worth all the care you can give them in planting.

The Clematis can be grown in several ways, and in each produce most charming effects. It may be grown on a veranda, or on a trellis, or over an arbor, or trained to a pillar, or a stake, or on a wall, or in a bed; and if in a bed, it should be a circular one not less than ten feet in diameter. If some brush be thrown over the bed, the effect will be very picturesque. This was a favorite method with the late Mr. Downing; and I remember how much I admired some Clematis he had planted among a clump of very old shrubs, the nakedness of which they covered in a most graceful manner.

In training on a trellis, a shoot here and there will occasionally need a little help to get the trellis evenly covered. Small woven wire, with large meshes, is much the best frame for the Clematis to run on, especially when something in the nature of a screen is desired. If longitudinal wires are used, No. 14 wire is large enough; but in this case small copper wire should be used vertically or diagonally to lead the shoots where wanted.

The Clematis is divided into types or classes, which flower at different seasons, and by making a judicious selection from these, you can have a continuous succession of bloom from spring till autumn. The types alluded to are chiefly the *Montana*, *Patens*, *Florida*, *Lanuginosa*, *Jackmani*, and *Viticella*, and they bloom somewhat in the order in which they are named.

The recently introduced *C. coccinea* and *C. crispa* are native species, and bloom early. Some amateurs have been made unhappy on seeing *C. coccinea* die to the ground in the fall; but that is all right. It is the nature of the plant, as it is of some others.

Looking at the accompanying illustration for a moment, the dark-colored flower on the left with a white stripe is the *Jackmani* type, and close at hand is the *Patens* type. The large white flower in the center lower down is the *Lanuginosa* type, the flowers of which sometimes measure five and six inches in diameter. Above these are single flowers of the *Patens* and *Florida* types. In the lower left-hand corner, the small, bell-shaped flower is *C. coccinea*. The picture, as a whole, is an excellent portraiture of the various types of the Clematis on a small scale. This article would be very imperfect

without a list of kinds to plant. The list is necessarily very brief, and only embraces a few of the more desirable kinds in each class. There are a good many more equally good, and some perhaps better; but they are mostly high-priced, and not easy to get. To put the list in the most useful form, I have arranged the classes in the order in which they flower. I place the species first.

Clematis montana, large pure white flowers in spring and summer. *C. coccinea*, a native species from Texas, bearing small, brilliant, scarlet flowers from June till frost. *C. crispa*, another native species, bearing very fragrant lilac-purple flowers in June and July. *C. Flammula*, bearing numerous

the center bar; Albert Victor, deep lavender, pale bar; Standishii, light mauve.

Florida type, bloom in summer on the old wood: Lucie Lemoine, double white; Sieboldii, creamy white; Fortunei, double white; John Gould Veitch, double lavender blue; Duchess of Edinburgh, double white.

Lanuginosa type, bloom in summer and autumn on summer shoots: Lanuginosa, pale lavender; lanuginosa candida, grayish white; lanuginosa nivea, pure white; Aureliani, light blue; Gem, lavender blue; Lady Caroline Neville, French white, mauve bars; Otto Froebel, French white; William Kennett, lavender; Lawsoniana, rosy purple, very large; Duchess of Teck is of a pure white, with a mauve bar.

Jackmani type, bloom during summer and autumn on summer shoots: Jackmani, deep violet purple; Jackmani superba, an improved Jackmani; Star of India, reddish plum, red bars; velutina purpurea, rich mulberry purple; Lady Stratford de Redcliffe, delicate mauve; rubella, rich claret purple; Prince of Wales, deep purple; rubra violacea, is a beautiful maroon purple.

Viticella type, bloom in summer and autumn on summer shoots: Thomas Moore, plush violet; Mrs. James Bateman, pale lavender; viticella rubra grandiflora, bright claret red; viticella ramosa, reddish purple; viticella modesta, large bright blue; Lady Bovill, grayish blue; Hendersoni, bluish purple, bell-shaped; Francofurtensis, is of a deep purple color.

The Clematis requires careful handling at all times, as the wood is very brittle. The shoots, therefore, should never be allowed to hang about loose. As to pruning, very little is needed, except to cut out dead wood in the spring. The kinds that flower on the summer shoots may have the old wood shortened in a little

A BOUQUET OF CLEMATIS.

small, fragrant white flowers from July to September.

The following, chiefly hybrids, have been mostly raised from the large-flowering kinds sent from Japan by Siebold and Fortune. For convenience they are usually divided into classes, which, as just stated, I have placed in the order in which they flower.

Patens type, bloom in spring and summer on old wood: Miss Bateman, white, dark bar; Lord Loudesborough, deep mauve, red bar; Lady Loudesborough, grayish white, band; Mrs. S. C. Baker, French gray, pale bar; Fair Rosamond, bluish white, claret bar; Stella, deep mauve, reddish pale red bar; Vesta, white, with creamy tinge over

in the spring; but, aside from cutting out dead wood in the spring, the Clematis may be mostly left to itself. *Coccinea* will renew itself annually; all the old wood, therefore, should be cut down to the ground, as it will all be dead. With the exercise of a little judgment in placing the kinds along a trellis, it may be made beautiful with flowers its whole length during the entire season.

I have not gone into ecstasies over the Clematis, as I might well have done, and felt inclined to do. There is no room left for it now. I therefore leave to those who plant them the full enjoyment of these charming flowers.

P. B. MEAD.

The Window Garden AND GREENHOUSE.

THE WINDOW GARDEN FOR AUGUST.

If your Cinerarias and Calceolarias are not yet sown, sow them, and keep them in a cool, shady place. Prick them off and pot them singly as soon as they are large enough to handle. Some chopped-fine tobacco-stems scattered among them will keep off green fly.

Repot Chinese Primroses before they become pot-bound. If you have none, sow now and you will get nice blooming plants for late winter or early spring.

Repot young Cyclamens as they need it. Old Cyclamens at rest in pots or planted out will now be starting to grow; lift or repot, using rich, mellow, light earth, and well-drained, clean pots.

Geraniums, Heliotropes, Mahernias, and some other plants required for next winter's flowers, should be lifted and potted before the warm season passes; but Bouvardias, Carnations, Libonias, and some others are in time enough for a month or more yet.

Sow biennial Stocks for blooming next spring, and Meteor Marigolds for winter flowers. Attend to staking, tying, pinching, watering and other routine matters as formerly advised.

To rank-growing plants that are pot-bound, give encouragement in the way of liquid manure.

Use the prunings of Geraniums, Fuchsias, Alternantheras, etc., as cuttings. Strike some Nasturtiums (*Lobbia*) and when rooted grow them along in pots for winter flowers.

The following notes and queries have been sent to me by readers of THE AMERICAN GARDEN, and the answers to them may appropriately serve as seasonable hints at present.

GRAPE MYRTLE AND POMEGRANATE.

"I have a Grape Myrtle and a Pomegranate which I have grown in boxes for years and wintered in the cellar, but they are not doing well and they did not blossom last year. What had I better do with them?"

If they are in fairly good health let them alone till next spring, then just as their wood buds begin to swell, cut the plants in pretty well, turn them out of their boxes, shake away all the old soil from the roots, and return the plants to those or other boxes, using fresh, fibrous, loamy soil with rotted leaf-mold mixed with it, and observe that the boxes be barely big enough to hold the roots comfortably. Better use a small box and shift a little later into a larger one, than over-box your plants.

ZEPHYRANTHUSES CROWDED IN POTS.

"I have a six-inch pot so full of pink Zephyranthes that the bulbs appear to be crowded in it. Should I shift the whole mass into a larger pot, or divide and repot into more pots?"

Shift into an eight-inch pot; that will not much disturb their blooming, and then when they get pot-bound again, divide the mass and repot into the six-inch pots. Bulbous plants cultivated in pots should not have very much pot room if you want a full crop of flowers.

GLOXINIAS AND BEGONIAS.

"I wintered my Gloxinia and Begonia

bulbs in shallow boxes with a little dry earth over and about them, as you advised, and kept them in the cellar. The cellar is a dry one; nothing ever freezes in it, and Geraniums, Roses and Chrysanthemums live and sprout in it, but all my Gloxinias died; all Begonias lived. What was the cause?"

Cold. A merely frost-proof cellar is not warm enough for Gloxinias; they should be kept in a winter temperature of 45° to 55° and the last is the better one. Tuberos-rooted Begonias are very much harder than Gloxinias; indeed, away from frost is all the winter temperature they need. I now have Gloxinias in bloom in pots and have had others in bloom all summer, also I have 360 square feet of cold-frames occupied by Gloxinias, and half of them were wintered as recommended to our correspondent, except in a high temperature, and that, too, without losing one bulb; the other half are from seeds sown or cuttings made last spring. For cuttings I used the sprouts that grew on some of the "bulbs" while they were yet in their winter boxes.

A THERMOMETER.

This costs only a few cents, and if one has to winter plants in the cellar it will pay to have a thermometer in it. Many plants, Geraniums for instance, will bear with impunity a little frost, whereas Gloxinias, Achimenes, Tydas and the like cannot be wintered with certainty in a temperature of less than 45°, and if some degrees higher so much the better.

GESNERA.

"I want a Gesnera. What one had I better get and how treat it? I have nice, south-facing windows and warm rooms."

Get *Gesnera exoniensis*. Treat as you would an Achimenes, only keep it a little warmer in winter, and in summer keep it away from strong sunshine. It rests in winter, starts to grow in spring, and blossoms, according to treatment, from July till the month of October.

GERANIUMS.

"Last winter I had Geraniums in bloom in the house from November till spring. They were raised from cuttings in June and grown in tin cans, and they blossomed better than any I ever before had grown. In the fall I lifted and potted some other Geraniums as carefully as I could, and grew them in winter in the same windows as I did the June-struck cuttings, and they did not have a sign of bloom till the end of March. Hereafter I always shall start my cuttings in June for winter flowers."

We who have greenhouses do nearly the same thing.

WM. FALCONER.

HELIOTROPES FOR WINTER BLOOMING.

Heliotropes are largely used for cutting in winter, and when properly grown are exceedingly productive. My method for producing Heliotrope flowers in winter is different from that generally practiced, and as it is particularly adapted to the use of those who have little room, I will give it in detail.

For plants which are wanted to bloom in December, I usually begin by putting in a good supply of cuttings early in August. In a cool, shaded house, if the cuttings are soft, thrifty shoots, they will root readily at this season, and by the latter part of the month should be potted into two-inch pots, using a compost of decomposed sod and nu-

nure. As soon as they start into vigorous growth pinch out the tips, which will make them grow bushy.

As soon as the small pots are well-filled with roots, shift the plants into four-inch pots; place them close to the glass and in full sunlight, and give plenty of air to avoid having the plants drawn, and give a night temperature of 60° to 65°. Pay strict attention to watering, and keeping down red spider and green fly. Heliotropes will not stand strong fumigation, and it is better, therefore, to use a decoction of tobacco for syringing to keep down the aphid. If well treated, these plants ought to be in full bloom by December 1st.

When the main part of the flowers have been cut and the plants appear enfeebled, cut them down to within three inches of the pot, shake them out of the old soil, and repot in same pots with new compost. They will soon start into a fresh growth and give another profuse crop of flowers by February. After this bloom is over, cut the plants back, but do not shake them out, and the result is that by bedding-out time they are compact little bushes ready to go out and bloom all summer.

To follow up the plants which bloom early in December, I put in another batch of cuttings about September 1st, so as to have them bloom when the first ones have been cut down. By this method I always have an abundance of flowers. It will be seen that our Heliotropes never get into a larger pot than the four-inch size, and the quantity of bloom that can be taken from them is a surprise to anyone who has never tried it.

For this method it is important to use varieties which are naturally dwarf in habit. The most profuse bloomer I have ever tried is the Snow Wreath, but the best flowers are produced by a dark variety raised here in Baltimore, called Lizzie Cook. Baltimore florists use it almost exclusively. With this variety and Snow Wreath I have produced over 6,000 heads of flowers, on a table four feet by 16, during the months of frost.

WM. F. MASSEY.

SOWING CINERARIAS AND CALCEOLARIAS.

There is no great difficulty in starting these beautiful plants. Prepare a pan of light soil, on the top of which spread about one-eighth of an inch of finely sifted Sphagnum Moss. Old, dry Moss rubbed through a No. 4 sieve is best. After watering copiously, sow the seed on the top, and cover the pan with a pane of glass; place in a shaded greenhouse and no more water will generally be needed until the seedlings appear. Seed sown during August and September will make grand plants for spring blooming.

ASPARAGUS TENUISSIMUS.

Nothing can exceed the feathery grace of foliage of this most beautiful of all vines for pot culture, and it grows up a string nearly as fast as Smilax. It keeps fresh so long after cutting that it is particularly desirable as a green for bouquet making. One of the most handsome and unique bridal bouquets we ever saw was composed of *Niphetos Rose-huds* just shaded over with a filmy veil of the downy foliage of *Asparagus tenuissimus*. This plant grows so readily from cuttings that it will soon become plentiful.

THE STAG-HORN FERNS.

These singular and beautiful Ferns have lately come into more frequent use for decorative purposes, and a large, well-grown plant is indeed a most attractive sight in the conservatory or parlor. It is generally supposed that these Ferns cannot be grown as window plants, but such is not the case, as, to the contrary, there are few plants which accommodate themselves so readily to various conditions of temperature and moisture.

Platycerium alcicorne, the true Stag-horn Fern, and the kind most frequently seen in cultivation, is a native of New South Wales, where it is found growing on the trunks of trees, and therefore under cultivation it succeeds best and appears to best advantage when grown on blocks of wood or stems of Tree Ferns. But it may also be cultivated in pots containing plenty of potsherds and pieces of charcoal, and a soil consisting of leaf-mold and sand.

A larger, and as yet rarer species, is *P. grande*, the Elk's Horn Fern, of the grandeur of which our greenhouse specimens convey hardly an adequate conception. Of this, F. W. Burbidge, the well-known botanist, says in his work of travels in Borneo:

"I resided for some time in a house which had been occupied by Mr. Hugh Low, the garden and fruit orchard of which afforded me most delightful walks morning and evening. I never saw the Elk's Horn Fern so luxuriant anywhere as it was on the trunks of some large Orange-trees here. The barren fronds were broad, like the horns of the giant Irish elk, and the more slender, fertile ones drooped on all sides from the base of the nest formed by the leafy expansions. I measured some of these fertile fronds, and found them fully seven feet in length. These splendid Ferns, and the choicest of epiphytal Orchids, which had been planted among the branches of trees, made a walk among them most enjoyable."

The species of this genus are few in number, nearly all tropical; the two named above and *P. biforme*, *P. Aethiopicum*, and *P. Wallichii* are the best known.

FORCING LILIES.

LILIUM CANDIDUM.

In forcing *Lilium candidum* it must be remembered that the best success can only be had by lifting the bulbs at their dormant state, which is in July and August just after their flower stems have ripened. If lifting the bulbs is deferred until after they have made their crown of foliage which remains green through the winter, little success need be expected.

Lift when dormant and pot in a soil largely composed of leaf-mold and sand. Animal manures are injurious to all Lilies. Keep them well watered but moderately cool overhead until the pots are well filled with roots. As a rule no plant can be successfully forced into bloom until the pot is full of good working roots. This is the great secret of successful forcing. Even persons who ought to know better, shift plants from a small pot into a large one and put it at once into a forcing temperature, with the

result of sour soil and unhealthy plants with little bloom. If you have a good plant with a pot full of healthy roots you may give heat and stimulating manures freely, but not otherwise.

THE HERMUDA LILY.

This Lily, also known as *Lilium Harrisii*, may be treated as *L. candidum*, with the exception that where growing in the open ground they will not be ready to lift before October. The bulbs which were forced early last winter and allowed to complete their growth and ripen off in pots, should now be shaken out and potted in fresh soil, giving them the same treatment as recommended above.

This Lily and the old *L. longiflorum*, and in fact all true Lilies, may be forced year after year if properly ripened off after blooming, and where care is taken to injure the roots as little as possible in shifting. A good practice is to simply shake off the top soil from the ball and repot without separating the bulbs for several years until thought too large. In this way it is not rare to have ten stalks in a pot, of *L. longiflorum* producing from three to six flowers each.

PLATYCERIUM ALCICORNE.

POTTED PLANTS AND COMPOST.

When potted plants become pot-bound, says Wm. Beckman in the N. Y. Tribune, the effect is seen in checked growth, yellow foliage and imperfect blooms. They should then be repotted in a size larger, or the ball of earth set into water with the chill off, until the earth dissolves from the roots, then repotted in a pot of the same size, with fresh soil and shaded for a few days until the roots get established. I have often treated plants in bloom in this way without injury.

When the pots get green they should be washed inside and out; a few hours' soaking will loosen the coating, when it may be washed off with a rag or brush. Plants always grow best in clean pots. Rooted cuttings should not be potted in too large pots; 2½-inch pots are usually large enough; I have seen men pot cuttings in six and eight-inch pots.

The best soil for plants is pasture sods pared thinly and laid in a pile to decay. If kept wet and turned over several times, it

will be just right for winter use. Plants luxuriate in such soil. A mixture of one-third old cow-mannure with it, is fine for blooming plants.

CALLAS FOR EASTER.

Plants which have been kept dry should now be shaken out of the old soil, cleared from dead roots and off-sets, potted in five and six-inch pots, and left out doors on a bed of coal ashes until cold weather sets in. Usually it is better not to try to hurry them into bloom, but to keep them in a moderately cool house. About six weeks before Easter they have to be placed in a light, warm house with a temperature of 60° at night, watered with tepid water and liquid manure twice a week. Syringe twice a day to keep down red spiders. By this treatment the bulk of their flowers may be had in bloom when they are most appreciated.

THE NEW DWARF STEVIA.

Stevia serrata nana.

Those who have grown the old *Stevia* know what an amount of trouble is required to keep it compact by constant pinching.

This new variety which was raised by Mr. Fistler, gardener at the White House, is a decided improvement on the old form. It produces a denser mass of flowers, never grows over 18 inches high, and we have seen it in ten-inch pots standing not over 12 inches above the rim, and measuring the same through the head without having been pinched in.

OUR WINDOW BOX.

For floral decorations of all kinds there is an increasing inclination for distinct colors.

Rose's Tobacco Extract Insecticide Soap is an excellent remedy for green fly and other insects infesting house plants, and much more conveniently applied than fumigation.

Insufficient drainage is a frequent cause of failure with pot-plants. The remedy is repotting and in so doing using plenty small pieces of broken pots or small lumps of charcoal in the pot.

Geraniums raised from cuttings this spring should now be potted in four-inch pots. If kept in a healthy growing condition they will make beautiful growing plants for the house when frost kills our out-door flowers.

Not more than one flower bud of Camellias should be allowed on each terminal shoot, if size and perfection of flower are required. Remove all others before the buds begin to swell; if delayed longer, little advantage is gained.

Orchids are becoming more and more fashionable, and many of our rich belles don't hesitate to pay \$20 and more for a single spray to wear at a reception or party, as long as it is fashionable and becoming. Well, the money does somebody good, and they might spend it for worse purposes.

Lawn and Landscape.

TRANSPLANTING GRASS.

Few persons may have considered that grass can be propagated in any other way than by sowing the seed, or by sodding. But I have learned, after many years' experience, that there is no more satisfactory way of making a beautiful lawn of clean grass—a lawn that will be absolutely free from weeds—than by establishing a firm and complete turf by transplanting the roots of grass. When a lawn is sodded—which is an exceedingly expensive way to produce grass—there will usually be numerous weeds in the sods, which will cause an untold amount of trouble; but when a lawn is properly prepared by digging, and pulverizing the soil, and grass roots are planted, no troublesome weeds will ever appear.

This method is of special value in dry, sandy soil, and the grass best suited for this purpose is the White Bent-grass, *Agrostis alba*. I have frequently observed how rapidly this grass would spread in pure sand, where it was not disturbed, covering in a single season several square rods with beautiful green turf, where there was nothing but sand. Those who find difficulty in establishing lawns free from troublesome weeds, may dig up their lawns, manure them generously, rake the surface over and over, for several months in succession, and then dig up the roots of the *Agrostis alba*, and transplant them just as Cabbage plants.

Small pieces of roots are planted about 20 inches or two feet apart each way, in mellow ground, and the surface is kept clean and free from weeds, between the grass-plants, until the spreading roots have covered the entire lawn.

In many parts of New Jersey the soil is so sandy and barren, that even Horse Sorrel or the White Daisy will not grow. Yet this grass if allowed to grow *ad Vitum*, will soon change an arid sand-plot to a luxuriant green carpet.

The White Bent-grass resembles the Red-top, *Agrostis vulgaris*, except in the color of the panicles, which are red in the Red-top, and of a very light color in the White Bent. Its roots spread by stolons, or stolons having joints every inch, or a few inches apart. Every joint, if transplanted during the growing season, will soon send up tender blades of grass, and begin to throw out young roots; and as the roots spread, spears of grass will come from almost every joint, until a firm turf has been established all over the ground. Such a lawn, if well cultivated until the grass covers the whole surface, will be permanent, and entirely free from weeds and unsightly spots.

S. E. T.

EFFECTIVE PLANTING.

One of the most desirable results of well-directed efforts in landscape gardening is the forming of beautiful natural pictures. The curving of paths through closely-shaved lawns, the planting of specimen shrubs, and the cutting out of geometric flower-beds is common enough, and constitutes, with level grading, the bulk of the art as seen around villages and cities, but unfortunately little or no attention is given to background relief

or the relative position of trees and shrubs.

It is a great pity that more attention is not paid to this matter, as some of the most beautiful effects can be produced with very little expense,—generally with the same materials used in indiscriminate planting,—which will give an individuality to the place, difficult or impossible to attain with ordinary hit-and-miss planting. As a general thing a man buys a Cut-Leaved Birch, a Weigelia or Hydrangea, not because he has a place peculiarly adapted to any of them, but because his neighbor has one; because it looks pretty in the agent's plate book; or because it is included in somebody's list of trees and shrubs suitable for suburban grounds.

In re-arranging old grounds very marked effects can often be produced by using the older plantings for a background to the new. In many places beautiful old evergreens stand in positions where they can be made to serve as background from three or four directions for some tree with marked characteristics. If the side next the street is available, a White Dogwood, a Hawthorn or a Siberian Crab may be planted in range; from some other vantage point a Purple Beech or a White Birch may be brought in line; while from the house side it may serve as a background to a *Cornus sanguinea* or a Snowball.

The many ways in which evergreens can be utilized as backgrounds make them particularly valuable. The American Arbor Vitæ makes a high, close screen, taking but little room at the base, and while it may be made to hide a barnyard in the rear, its front side may bring out in strong relief any bright or beautiful object, from a Peony, or group of double Hollyhocks, up to a Syringa or a Pear-tree. If the evergreens that are scattered in unmeaning profusion on many front lawns could be gathered in irregular groups at the rear and sides of the house, leaving irregular nooks for the placing of showy shrubs and flower-beds, the general effect would be greatly improved, while at the same time the care of the lawn would be simplified and cheapened.

I cannot endeavor to enumerate the endless changes that can be produced by judicious planting, nor is it necessary, as chance examples may be seen everywhere, often as a Dogwood in the edge of a forest, or a Lilac in front of a Crab Apple, common to be sure, yet beautiful notwithstanding.

L. B. PIERCE.

A HARMFUL PHASE OF TREE SENTIMENTALITY.

There is a sentimentality which often makes itself manifest in regard to trees, which is likely, if not corrected, to do more harm than good to the cause of tree-culture and forest preservation. There is nothing sacred about a tree in itself, says the editor of *Outing* in the July number, and there is no more harm in cutting it down, when occasion demands, than there is, under the present conditions of civilization, in killing an ox for food.

The true friends of forest preservation seek to perpetuate the forests for the sake of mankind, that the timber-supply may be preserved and the equilibrium wisely established by nature may be maintained for the benefit of the climate and the soil, and for the prevention of disastrous floods. To this

end we must make judicious use of the gifts which God has given us in the forests, neither squandering them on the one hand nor making idols of them on the other. It is the wanton waste of life, be it vegetable or animal, which is a crime against nature. Our actions, however, must be governed by a regard for the interests of man, and not by a false sentiment for the "rights of the trees." If a tree be in the way,—if, for instance, it shades a dwelling so as to make it dark, damp, and unhealthy,—it should come down. To keep a tree in the wrong place is a vandalism only second to that which destroys tree-life indiscriminately.

A hue and cry is now and then raised through a failure to understand this distinction. A case in point is that of the recent cutting down of some trees in the grounds of the Capitol at Washington, which caused the eminent landscape-architect having the matter in charge to be vigorously denounced for his action. The facts in the case are, however, that the design for the grounds, made on a scale worthy of the noble building which they environ, contemplated a broad mall from the end of Pennsylvania avenue to the foot of the Capitol terrace. This was on the line of a narrow path which was bordered by some fine trees. Some of these were left to furnish shade while the rows of trees bordering the mall were growing. The latter having become large enough to give good shade, and it being time for the completion of the improvement, and, moreover, as the old trees were crowding and injuring the new ones, their removal was ordered. Certain newspaper correspondents seeing this, and not knowing what was intended by the new design, straightway telegraphed the story of the vandalism over the country.

PRUNING EVERGREENS.

In nothing has progress in arboriculture been better indicated than in the use of the pruning-knife on evergreens. Up to within a recent period one might prune any trees except evergreens, and few articles ever took the public more by surprise, says Thomas Meehan in the *Gardener's Monthly*, than our first paper showing that pruning benefited these plants. Now it is generally practiced, and it is believed to be followed with more striking results than when used on deciduous trees.

In transplanting evergreens of all kinds from the woods, the best way to save their lives, is to cut them half back with hedge shears, and when any come from the nurseries with bad roots which have accidentally become dry, a severe cutting back will save them. And then if we have an unsightly evergreen—a one-sided or sparsely-clothed evergreen—if it is cut back considerably it will push out again green all over, and make a nice tree. It must be carefully remembered, however, that in all these cases the leading shoot must be cut away also.

An idea prevails that a new leading shoot will not come out on the Pine family after one has lost its first. But this is a mistake; sometimes they will not show a disposition to do so; side shoots near the leader's place will seem to put in rival claim for the leadership the following year, but if these are then cut away they will not make a second attempt, and the real leader will push on.

ground were to be stirred at all in spring it should not be done deeper than one-eighth of an inch, and never after blossoms appear.

A. S. Fuller spoke on fertilization and the influence of the pollen on the berry. In his usual clear and concise manner he described the construction of Strawberry blossoms, and the differences between staminate and pistillate varieties. That the influence of the pollen reaches further than the seed, and that the berry itself becomes affected by the pollen, he had become convinced of more than twenty years ago. Several instances in proof thereof were cited, and the fact that when pollen is not applied to imperfect flowers the blossoms wither and the stems die, while when after pollen is applied the fruit stems expand and become more vigorous, shows plainly that the whole plant becomes changed by fertilization.

It was voted not to hold any meetings during July and August. The next regular meeting is on the second Tuesday in September.

SOCIETY OF AMERICAN FLORISTS.

The first annual meeting of this Society, to be held at Music Hall, Cincinnati, August 12th to 14th, promises to become the most interesting gathering of the kind ever held in this country. The officers in preparing their programme for the occasion have very wisely not followed the familiar beaten tracks, but boldly strike out for new and unique features. The papers to be read and discussed form an important epoch in the annals of floriculture, coming as they do from acknowledged masters of the subjects presented. The exhibition of plants and flowers will be unique in character, different materially from any previous exhibition ever made in this country. It is the earnest desire that all members having seedlings, novelties, or plants of merit will not hesitate to exhibit them. No plant or flower of merit will be unrewarded. There will also be exhibitions of implements and appliances used in floriculture, heating apparatus, florists' requisites, artists' work related to floriculture in any and every branch.

Among the papers will be: "Forcing of Bulbs and Plants for Winter Use," by Carl Jurgens, Newport, R. I.; "Diseases of Plants and their Remedies," by Charles Henderson, Jersey City, N. J.; "On the Floral Embellishment of Parks and Gardens," by H. DeVry, Superintendent of Lincoln Park, Chicago; "The Cut Flower Trade. Sale, shipment, packing, and the mutual interests of Grower, Commission-man and Retailer," by Win. J. Stewart, Boston, Mass.; "Roses. The Propagation of Tea Roses, their Subsequent Treatment, and the Raising of New Varieties," by Jno. May, Summit, N. J.; "What shall we Grow for Early Spring and Summer Cut Flowers?" by Henry Michel, St. Louis, Mo.; "Steam vs. Hot Water for Heating Greenhouses," by Jno. Thorpe, Queens, N. Y.; "Pioneer Florists," by S. S. Jackson, of Cincinnati.

A richer bill of fare could hardly be desired by the most fastidious floricultural epicure, and from the well-known ability of the essayists a rare treat may be counted upon. Circulars and more detailed information may be obtained from the President, John Thorpe, Queens, N. Y., or the Secretary, E. G. Hill, Richmond, Ind.

OUR BOOK TABLE.

Architecture Simplified, Geo. W. Ogilvie, Chicago. A small pamphlet of 60 pages, containing a good selection of house plans, from the most modest cottage to the elaborate suburban dwelling-house; also many useful tables about building.

Fifty Years Among Small Fruits, by Wm. Parry, Parry P. O., N. J.—In this pamphlet the author, who is one of the most experienced and skillful fruit growers in the country, gives in a condensed form the results of a life time in fruit growing, and describes the methods now followed at the Pomona Nurseries. Each class of small fruits is treated separately, together with descriptions and illustrations of the leading varieties.

Good Housekeeping, the new fortnightly journal "of the higher life of the household," fulfills the promise of its prospectus, and might well be the crowning effort of the useful life of its projector, Mr. Clark W. Bryan. It is so nearly perfect that we see no room for improvement. The family who could not live a better life with it as a constant visitor is already perfect, or below the reach of good influence. It is one of the few papers that, in a very busy life, we always look over carefully when it comes to our desk. Clark W. Bryan & Co., Holyoke, Mass.

Mushrooms of America, edible and poisonous, by Julius A. Palmer, Jr. L. Prang & Co., Boston, Publishers. We have frequently had occasion to favorably notice the beautiful publications of this house, but none we have hailed with as much delight and satisfaction as this. What a relief to be able to refer the innumerable inquirers about "how to tell an edible Mushroom from a poisonous one" to this excellent work, which will give them the answer at a glance. The colored illustrations, of which there are twelve, comprising twenty-eight species of our most common native Mushrooms, are so accurate and life-like that no one can mistake one for another; and the descriptions, the result of the author's many years' careful study, are given in so clear and plain a manner that anyone without any previous botanical knowledge may understand them. The value of this work for schools cannot well be over-estimated; the framed plates should find a place on the walls of every school-room in the land. The work is also published in smaller plates in strong and convenient portfolio. Price \$2.00.

ANSWERS TO CORRESPONDENTS.

Moss-Covered Trees.—F. R., Westchester. If the moss is thick on the trees it should be scraped off with a hoe, but not so hard as to injure the bark. Then the stem should be washed with a solution of potash in water, or strong alkaline soap-suds.

Manuring Lilies.—N. T. L., Astoria, N. Y.—Fresh animal manures are, as a general rule, injurious to Lilies, especially when the bulbs are in a dormant state, but to a vigorous-growing potted Lily of any kind, an application of weak liquid manure, once a week, can bring no possible harm.

Squash borers.—S. P., Flushing, N. Y.—Paris green has been used with success at the N. Y. Experiment Station. Vines that were sprinkled with Paris green and water were not attacked by borers. No possible danger can arise from this, as none of the parts of the plants to which the poison is applied are used.

English Walnut.—D. D., Ringville, Canada. The tree is not a native of England, as its popular name would lead us to suppose, but of Persia and other parts of Asia. There are some large specimens in the vicinity of New York, but it is very doubtful whether the tree will survive Canadian winters. Seeds of *Ampelopsis Veitchii* may be obtained from my good seed-house.

Failure with Lilies.—J. C. C., Baltimore.—Without a knowledge of all the conditions under which the bulbs are placed, it is impossible to tell why they fail. A frequent cause of failure with spring-planted Lilies, is that the bulbs have been kept out of the ground over winter. The sooner, after being taken up, they are planted the better, and it is for this reason that fall planting is preferred by many. *Lilium candidum* should always be

Sowing Onions in Autumn.—J. E. D., Buffalo, Wyoming Twp. The great essential point in sowing Onion seed in spring is to get it in the ground as early as possible. It is useless to expect a satis-

factory crop after the weather becomes warm. Your spring season is probably too short for successful Onion growing, and it would be well to try the experiment of fall sowing. Sow about a month before winter sets in, and after the ground becomes frozen, mulch with straw or some other suitable material.

A Flooded Garden.—Mrs. T. P., Laprairie, Canada, writes: "When a garden is flooded with icy water semi-annually—spring and autumn—could one hope in any reason to successfully grow any sort of bulbous plants therein?" This is a discouraging case, to be sure, yet not a hopeless one. If the water cannot be drained off, the next best thing to do is to make raised beds, the surface of which should be not less than one foot above the highest water level. Such a position should prove congenial to almost any kind of bulbs.

Some Good Chrysanthemums.—L. H., New York. The list of good varieties is now so large that it is not an easy matter to select a few only that would be considered best by everyone, yet the following cannot fail to give satisfaction: Elaine, white; Fair Maid of Guernsey, white; Gloire Raymond, satiny rose, quilled; M. Planchenau, mauve; Julius Scharff, violet amaranth; Stratum perfectum, rosy lilac; Mad. C. Andlinger, rosy pink; Bouquet Fruit, rosy lilac; Jardin des Plantes, yellow; Julia Lagravere, velvety crimson; Kira Kana, chrome.

TRADE NOTES.

ITEMS OF GENERAL INTEREST FROM THE SEED, NURSERY AND FLOWER TRADE ARE SOLICITED.

Stephen Hoyt of Canaan, Ct., says the nurseries of that State are well supplied with small fruit stock, with a small surplus.

Hance & Borden of Red Bank, N. J., keep a sort of advisory bureau for city customers at their city office at 22 Dey Street, New York.

J. G. Burrow, Fishkill, N. Y., thinks there will be a good crop of Grapes and young vines this fall. The Strawberry crop in that vicinity was a complete failure.

The Bowker Fertilizer Co. report a larger trade during the past season than in any previous year since they began. This is good proof of the quality of their goods.

Benjamin Hammond, Fishkill, N. Y., the "Slug Shot" manufacturer, now offers "Thripp Juice" as quick death to insects infecting ornamental trees, especially the Elm.

Boston manufacturers of heating apparatus for greenhouses, etc., state that trade in their line is rather dull, much more so than in many previous years. They say that but few new conservatories are in course of erection.

Storrs & Harrison, Painesville, O., report an unusually large phunt trade during the past season, and feel quite happy over the result. They anticipate a good trade next season, though admitting that the general outlook is not very promising.

W. C. Strong of Brighton, Mass., is establishing a new headquarters for his nurseries at Newton, under the superintendency of Mr. S. B. Green, late of Houghton Farm, and a graduate of the Massachusetts Agricultural College in 1879. Mr. Green is well fitted for the work by education and experience, and Mr. Strong has shown his usual good business sense in securing Mr. Green. He has had several of these college boys as superintendents in his nurseries, and evidently considers them profitable help.

WATER THE BEST MEDICINE.

The curative powers of water are known the world over, yet to comparatively few people. Such properties of water are best seen by contrast, when whole communities are stricken by disease through use of impure water. This great fact is evidenced by the growing use of famous spring waters, such as those at Baden and Ems in Germany, and at Saratoga and Waukesha, etc., in this country. Waukesha has rapidly grown in good repute within a few years, until now its waters are used in many States for table and medicinal purposes, even surpassing Saratoga in value. We know the Waukesha Glens water by personal use, and cannot say too much of its merits as a delicious and health-giving drink.

USE THE ONLY PURE WAUKESHA WATER.
WAUKESHA GLENN,

"QUEEN OF WATERS."

HIGHEST AWARDS OVER ALL OTHER WATERS, NATURAL OR ARTIFICIAL, AS A CURE FOR TROUBLES OF THE LIVER, KIDNEYS, BLADDER, ETC.

"PURE WATER is only to be obtained from NATURAL SOURCES."—Vide Lancet, July 7, 1883.
The dangerous qualities of contaminated drinking water are not obviated by the addition of wines or spirits.—Medical officer Privy Council, England.
Pure water is even more important than pure milk.—New York Herald.
The drink of the future.—Moody.
Helped more than two years' skillful treatment.—Sumner Stevens.
I am a living advertisement for this excellent Water.—W. Wilson.
Cured of Bright's Disease.—W. Hulthway.
The best merits all praise.—Hon. Geo. H. Peabody.
May the Glenn Spring continue to run Pure Water for ever and ever.—D. W. C. House.

"WAUKESHA GLENN" reigns alone among Natural Dietetic Table Waters. Its numerous competitors appear to have, one after another, fallen away until it has no rival.
With ladies, gentlemen, and *bon vivants* everywhere it has become the standard of dietary expedients, fortifying the digestive functions, and enabling free livers to indulge with impunity at the table. The world of wealth, intelligence and refinement testifies to its sparkling, naturally pure and delightful qualities, as the beverage incomparable, and need it be health and exuberant spirits. Endorsed by the Medical fraternity. It has been tested by thousands, whose uncollected testimonials are open to the public, and furnished to all who desire. MAILED PRICE.

Waukesha is a delightful Summer Resort, on the Chicago, Milwaukee and St. Paul, and Chicago and Northwestern Railways.

THE GREAT CALIFORNIA INSECT POWDER.

Perfectly Harmless to Animal and Plant Life. Manufactured from the pure Pyrethrum Cinerariae Folium Blossoms grown by us in California, where "Buhach" is Manufactured and Canned.

BUHACH has been carefully experimented with and has received the unqualified endorsement of the most eminent scientists and entomologists in this country, among whom we quote: Prof. C. V. Riley; Prof. A. J. Cook; Prof. E. W. Illigard, University of California; Prof. J. Henry Comstock; Prof. Matthew Cook, late Chief Horticultural Officer of California; Prof. W. A. Houry; Elbert S. Curran, Editor "Rural New-Yorker," New York; A. S. Fuller; Dr. F. M. Hoxmer.

The Dreaded Rose-Bug, Impervious to Paris Green and all other Arsenical Compounds, gives up the ghost to BUHACH.

BUHACH POWDER will kill Rose-bugs. Last year it was blown upon them through bellows. This year we propose to use a Buhach extract, made by dissolving four ounces of the powder in a gill of alcohol and then adding one gallon of water, applied with force pump and "cyclone nozzle." We do know that Buhach will kill cabbage worms and the dreaded rose-bug.—Rural New-Yorker, April 25, 1885.

CABBAGE WORMS AND POTATO BEETLES. Prof. A. J. Cook says: I found Buhach efficient in destroying the Colorado potato beetles, the caterpillars of the cabbage butterfly and plant lice.

SLUGS, CATERPILLARS, GRUBS, ETC., ETC. I find it very fatal to slugs, caterpillars, grubs, flies, mosquitos, and both parasitic and plant lice.—A. J. Cook, Entomological Laboratory, Agricultural College, Lansing, Mich.

BUHACH, Safe and Sure Insecticide. I have been surprised by the effect produced on the hairy Tent-caterpillar by water containing the extract of 1 lb. of powder to 50 gals. They paid little attention to the bellows and powder, at least when the wind blew; but a sprinkle of the diluted ex-

tract promptly caused them to squirm, drop off, and finally die while attempting to crawl away.—E. W. Illigard, University of California.

THE CURRANT WORM. Buhach, extended with plaster 50 times, kills the currant worm.—Rural New-Yorker.

DR. F. M. HEXAMER says: The efficacy of Buhach is so well known that its value as an insecticide is firmly established. We have lately experimented with it, and were highly pleased with the results. If properly applied it accomplishes all that is claimed for it, and has the great point in its favor that it is entirely harmless to human beings, as well as to house and farm animals.

MR. A. S. FULLER, Agricultural Editor "New York Sun," says: Some large climbing Roses that were badly infested with aphids and thrips were entirely cleared of their enemies by one dusting with BUHACH.

BUHACH is also an Absolute Specific for all insect pests of the household, such as Flies, Fleas, Mosquitos, Bed-bugs, Roaches, Water-bugs, Ang-Moths, Midges, Crickets, Spiders, Scorpions, etc., etc., etc.

PRICE OF BUHACH.—25 cents, 50 cents, 75 cents and \$1.25, according to the size of cans. Insufflators, 25 cents each. Sent by mail, post-paid, on receipt of price. Buhach is sold by Druggists, Grocers, Florists and Seed men out of our 6 lb. cans at \$1 per pound, or \$4.50 per can of 6 lbs. Extra Cyclone Pump with ten feet of pipe and ten feet of rubber hose and one Cyclone spray nozzle, complete, ready for work, price \$9.00. Extra Cyclone nozzle each 75 cents. Bellows with attachments for dry applications, \$2.00. Bellows with atomizer attachment for applying Buhach solution, \$2.00.

If Buhach is not on sale in your neighborhood, send your orders direct to us. Be sure you get "Buhach" and that the can is an original package. Many dealers will insist on your trying "something better" or "as good." Don't take it. Stand firm, and use nothing but "Buhach." Send for circulars, mentioning THE AMERICAN GARDEN.

PETER HENDERSON & CO'S Special Bulb Collections,

FOR INDOOR AND OUTSIDE PLANTING.

The following assortments have been carefully prepared, and with a view to their wide dissemination, we have made the prices for each and every collection exceedingly low, in fact the prices are so much below what the bulbs are usually sold separately for, that the offers are only made on the understanding that no collection can be divided, or any alterations be permitted. Patrons wishing to make their own selections, can readily do so from the detailed lists, to be found in our Bulb Catalogue, and at the reasonable prices there asked. Only the best quality of Bulbs are put into these Collections.

Collection A. Price \$3.00.

Contains 82 Bulbs of the following:

- 3 Hyacinths, double and single, named
- 5 " " " mixed
- 3 Tulips, " " " named
- 6 " " " mixed
- 1 " " variegated foliage
- 1 Narcissus, assorted named sorts

- 12 Crocus, assorted named sorts
- 18 " " mixed
- 1 Amaryllis Formosissima
- 12 Anemones, double and single
- 1 Crown Imperial
- 1 Freesia Refracta Alba

- 3 Jonquils, double and single
- 6 Oxalis, mixed
- 3 Ranunculus, double mixed
- 2 Scillas
- 1 Lillium Auratum
- 1 Cyclamen

Sent by Express on receipt of price, or by mail, if 50c. is added for postage.

ORCHIDS.

Our New Catalogue gives practical hints on how to grow these beautiful plants. We are now making these special offers:

- | | | |
|-----------------|--------------------------|---------|
| 12 CATTLEYSAS, | 12 kinds good plants for | \$12.00 |
| 12 LÆLIAS, | 6 " " " " | 9.00 |
| 12 ONCIDIUMS, | 12 " " " " | 9.00 |
| 12 DENDROBIUMS, | 12 " " " " | 9.00 |

We have lately added to our collection 4,000 Established Orchids, and from 3,000 to 5,000 Not Established. These fine plants are as cheap as good Roses; write to us, stating what you want, and what size of plant, and we promise to answer you by return mail. We grow to sell and only ask a trial. Our latest acquisition is

Plants from Guatemala.

From the great exhibit at the New Orleans exposition, comprising over 7,000, among which are fine masses of *Lycaste*, *Schmmerii*, *Odontoglossum grave*, *O. natchellum*, *majus*, etc.

Our collection is unequalled by commercial florists in America.

The American Garden

A Monthly Journal of Practical Gardening.

Dr. F. M. HEXAMER, Editor.

Vol. VI. (Old Series, Vol. XIII.)

SEPTEMBER, 1885.

No. 9.

THE LIFE OF A SUMMER NIGHT.

The American Garden.

Fruit growers will find in THE AMERICAN GARDEN through the year a great amount of valuable information on their specialty. We intend that no other journal shall excel us in the real value of its reading matter for fruit growers.

Market gardeners, and all farmers who grow vegetables for market, will find in THE AMERICAN GARDEN probably more valuable information on new and old varieties of vegetables, and their culture and marketing, than is contained in other journals in America. We consider the vegetable garden as important a part of horticulture as fruits or flowers.

Seedsmen, Seed growers, Nurserymen and Florists will find THE AMERICAN GARDEN one of the best journals in the world to keep them posted on events of importance in their business. We shall chronicle the advent of new varieties of fruits, vegetables, flowering and ornamental plants. We shall carefully investigate the merits of new sorts under all conditions, in all sections, and publish the records conscientiously, without fear or favor. We publish extensive reports of all important horticultural meetings and exhibitions. We aim to keep our readers informed of all progress in horticulture.

Skilled horticulturists everywhere are earnestly solicited to send us brief accounts of any interesting facts in their experience. Our corps of contributors is now large, but we want all the notes we can get from our readers in every State and country, on new varieties, the standing of old sorts, trials of new methods of practice, any changes of the condition of horticulture, etc., etc. We want THE AMERICAN GARDEN to be a faithful record of the condition of horticulture.

The special attention of our readers is invited to the offers of rare and valuable books on gardening, etc., and of a few choice periodicals and implements in connection with subscriptions to THE AMERICAN GARDEN.

Much of our space is taken up this month with Mr. Pierce's elaborate and interesting report of the first annual meeting of the Society of American Florists at Cincinnati. But the value of the material needs no excuse from us for occupying the room it requires.

An attractive feature in the development of a love for gardening among the people is the encouragement by the corporations of the culture of flowers by the workmen and officials about railroad stations. In some cases prizes are offered for the best kept grounds. This movement is particularly noticeable along the Pennsylvania, the N. Y. Central and the Boston & Albany roads, and perhaps

others which we have not seen. Where once was bare ground and perhaps unsightly piles of ashes and rubbish, now are neat driveways, smooth lawns, and pretty flower-beds. The practice of some of the roads in grading and grassing the embankments is a concession to good taste which must be welcome to all travellers.

GARDEN VIEWS.

A photograph of a charming landscape, just received from a friend, suggests the idea that others of our readers may have photographs or drawings of picturesque views, beautiful groups, and interesting or rare flowers and plants. Many of these, no doubt, would be of interest to a wider circle, and we should consider it a great favor to receive copies of such original photographs or drawings as may be suitable for engraving and publishing in THE AMERICAN GARDEN. Much good may be accomplished thus, and we shall cheerfully give full acknowledgment for all favors thus received.

A POINT OF GRAMMAR.

Excepting the always open question of the Potato Scab, there seems to be nothing so embarrassing to some persons as to find the correct plural of some names of plants. While they have no hesitation in using apparatuses, prospectuses, etc., for the plural of apparatus, prospectus, etc., when it comes to the plural of Gladiolus, Narcissus, Cactus, etc., what shall it be?

Many botanical names although originally of Latin or Greek derivation, are to-day as completely adopted into the English language as are thousands of other foreign words, and when once so recognized there is not the slightest reason why they should not be subject to the rules of English grammar. Gladiolus is not any more Latin than Geranium, Calla, Fuchsia, etc., and if the plurals of the latter are Geraniums, Callas, Fuchsias, and not Gerania, Callae, Fuchsiae, then surely the plural of Gladiolus is Gladioluses and not Gladioli. Gladioluses, Narcissuses, Cactuses, etc., may sound a little less euphonious than Gladioli, Narcissi, Cacti, etc., yet this can be no excuse for violating the English language. Custom has in some measure sanctioned the use of the singular form for the plural also, for the sake of euphony, so that it is admissible to say: "a bed of Gladiolus, Cactus, etc.," but to apply foreign endings to English words is neither correct English nor good taste.

WOMEN IN HORTICULTURE.

We have no patience with the superficial observers who twaddle about the degrading effect of out-door work upon women. They must be peculiar women who can be more "degraded" by working in God's pure air, amid the beautiful sights and sounds of nature, among the wonderful plants of garden and field, than by being cooped up in a hot kitchen, handling pots and kettles, doing chamber work and mending old clothes. No honest work is degrading to any man or woman, unless it injures the moral nature or weakens the body. We owe to our husbands and wives and children and our Maker the duty of performing the work before us to the best of our ability. We also owe to them the duty of doing the work we are best fitted for, and to take good care of our bodies

in order that we may do our work well.

No industrial pursuit is better fitted for women, and they to it, than horticulture, the culture of fruits, flowers and vegetables, for pleasure or profit. Already millions of women cultivate and love as pets the few flowering plants and vines in their windows; thousands know the pleasure of flower beds; and hundreds are practicing the art of gardening on a larger scale as a profession. May their efforts succeed, and may thousands more join their number! Thus will horticulture be honored, their own lives be made more beautiful and useful and mankind be blessed by the better health and higher aims of the mothers of Christendom.

TO OUR FRIENDS.

It may interest our friends and the friends of horticulture to learn that THE AMERICAN GARDEN is meeting with real success as an independent journal of horticulture. When we assumed the management last November many people predicted failure. But their predictions were as harmless as their endorsement is unsolicited.

THE AMERICAN GARDEN was a power in itself, and only needed well-directed hard work to push it to the success it has so far achieved, because there was a legion of intelligent horticulturists who stood ready to recognize honest endeavor in a field where workers are wanted.

Now we desire to join with ours the efforts of at least 20,000 intelligent, progressive horticulturists for the upbuilding of the most useful journal that can be made. We can't do it alone. We must have your cooperation if THE AMERICAN GARDEN is to be made as good and useful as it should and may be under proper encouragement. Will YOU cooperate?

THE FRUIT COMMITTEE

FOR THE AWARD OF THE AMERICAN GARDEN'S TEN \$100 PRIZES.

For particulars about the prize offers see the October issue.

We have the pleasure of announcing the following gentlemen as the Committee which will award THE AMERICAN GARDEN prizes for fruits. We believe that all are members of the American Pomological Society:

- (1) J. L. Budd, Ames, Ia., professor of horticulture in the Iowa Agricultural College; head of the system of 400 experiment stations in the Northwest for testing new fruits.
- (2) Chas. W. Garfield, Grand Rapids, Mich., Sec'y Mich. Hort. Society, and a skilled pomologist.
- (3) P. T. Quinn, Newark, N. J., Sec'y N. J. State Board of Agriculture, the well-known writer and horticulturist.
- (4) Wm. Saunders, London, Ont., known the world over as a promoter of horticulture, a close observer, a careful experimenter. He has a large collection of small fruits.
- (5) E. Williams, Montclair, N. J., a successful, practical horticulturist, and Sec'y N. J. Hort. Society.

All of these gentlemen are well known as careful, conscientious judges of fruits, and will no doubt satisfy the most critical as being above favoritism. All have collections of the newer varieties of small fruits, and are admirably situated for a fair and unbiased decision on the points at issue.

The committees for the award of the Flower and Vegetable prizes will be appointed by the Society of American Florists, and by the American Horticultural Society.

COUNTRY PICTURES.

In a Boston book store the other day we discovered a rare treasure for lovers of the beautiful in country life. It was a book of nearly fifty large, full page sketches of rare beauty and truthfulness, entitled "Our Year's Sketch Book." The artist, Irene S. Jerome, has reproduced here some of the finest of wood-scenes, fairylike landscapes, and the natural beauty of birds and flowers in the freedom of woods and fields. We looked the beautiful book through, once, twice, thrice, and it grew more and more entrancing with each glance. Of course we secured a copy for the little woman at home and made arrangements so that the friends of THE AMERICAN GARDEN can secure at moderate terms, as will be seen by reference to page 222, and on page 217 is a sample picture from the book, though not nearly so fine as in the book itself, which is printed on heavy paper, and is elegant in every way.

CORRECTION.

The Minnesota Apple which I recommend, *Giant Swan*, is misprinted in THE GARDEN "Swan." There should also have been a comma between St. Peter's and Prolific Sweeting. They are two very different Apples.
Dr. T. H. HOSKINS.

METROPOLITAN MARKETS.

IN BRIEF PARAGRAPHS FOR THOSE COMMERCIALY INCLINED.

A review of the month previous to August 20th.

FRUITS.

Peaches.—Californians have been preferred in quality until after August 15. They were Crawfords and arrived in 20-lb. packages; \$3.00 to \$4.50 wholesale. Mixons and Crawfords from North Carolina came in $\frac{1}{2}$ bushels; 75 cts. to \$1.00. Delawares are now excellent. They are Crawfords and Raveripes, the former \$1.00 to \$2.00 wholesale, or from \$1.25 to \$2.25 retail. If "selected," as sold in Broadway fruit stores, Raveripes bring \$2.50 a basket and "Crawfords" \$3.50 and \$4.00 retail.

Pears.—Long Island Bartletts arrived green, for cooking; 30 cts. $\frac{1}{2}$ peck, retail. Virginia Bartletts are \$4.00 a box, wholesale. California Bartletts, large and handsome, cost 75 cts. to \$1.50 doz., retail; early in August, \$5.00 to \$5.50 a box, 40 lbs., wholesale. Seckels on their first arrival from California, Aug. 15, brought the same as Bartletts; now \$4.00 a box, wholesale, and 50 cts. doz., retail.

Plums.—From California hold their first place. Egg Plums, large, sound, and highly flavored, are 50 cts. doz., retail. Columbias, a darker purple, not as large or firm, are 35 cts. doz., retail. Gross Plums, 30 cts. doz. Wholesale price of Plums is from \$2.50 to \$3.00 a package of 20 lbs.

Limes.—Jamaica Limes are plentiful, and in brisk demand, Lemons being somewhat scarce. A crate of 200 costs \$1.00 to \$1.25, wholesale; 25 to 20 cts. doz., retail.

Lemons.—Boxes of 300 to 300 sell at \$6.60 to \$8.00, wholesale, for best quality.

Oranges.—Messinas and Palermos are the kinds in market. Half boxes of 100 cost \$2.00, wholesale; 40 cts. doz., retail.

Cocoanuts.—\$4.00 to \$4.50 a sack of 100, wholesale; 10 cts. each, retail.

Pineapples.—Havana are the only sort now in market, at \$2.00 to \$2.50 a doz., wholesale; retail 30 cts. each.

Grapes.—Hot-house Grapes, both Hinnburgs and Muscats, have sold at \$1.50 to \$2.50 lb. for the past month. California Muscats appeared August 1 at \$5.00 per case of 40 lbs., wholesale; 5-lb. boxes now bring \$1.25, retail. Delaware Grapes are 40 cts. a 2-lb. box, retail; Coucords, 40 cts. 3-lb. box. Niagara Grapes are 25 cts. lb., retail.

Apples.—The varieties retailed are Astrachan and Sweet Bough, at 30 to 40 cts. doz., selected for table. Cooking Apples are poor enough to be windfalls: 15 cts. a $\frac{1}{2}$ peck.

FLOWERS.

The wholesale flower market is extremely dull, owing to the absence of the largest patrons from

the city, and the slackening of the watering-place demand. Roses from the greenhouses are in points more freely and Sunsets are somewhat more lively in color. The Wm. Francis Bennett Rose bids fair to fulfill all that has been promised for it; it will be no more expensive than La France, which it resembles in fragrance. La France are unusually fine for the season; they and Bennett Roses are bringing \$2.00 for the general run and \$4.00 per hundred for selected. Bon Silene, Suffrage and Douglas buds are \$2.00. Meriels are very scarce at \$4.00. Cornell Cook's General Jacqueminots of inferior quality struggle in occasionally and sell for \$4.00 per 100. Retail prices of flowers are so unsettled that they cannot be accurately quoted before next month. The shops are poorly stocked with anything but roses.

After Rose-growing the energies of plantsmen are all turned towards the fall crop of Chrysanthemums. There is a craze for the cultivation of this beautiful and useful flower. Several amateur growers will compete powerfully this autumn at the shows, and probably they will exceed any exhibition heretofore held. The new seedling Chrysanthemum plants will undoubtedly be held at a high price.

VEGETABLES.

Potatoes.—New potatoes have steadily declined in price and improved in quality since reaching mature size. Early Rose and Beauty of Hebron take the lead in quality, Burbank's, first last season, are now third-rate. Long Islands are \$1.25 to \$2.00 a bbl., wholesale, and \$1.50 to \$2.00 retail. Southern have disappeared from market.

New Sweet Potatoes from South Carolina are of good size and quality. Early in the month they sold for 60 cts. a $\frac{1}{2}$ peck; now 40 cts., at wholesale 25 per cent less.

Celery.—Early in August from Kalamazoo, Mich., came Celery, which brought 60 cts. a bunch, now retail 50 cts.; the next week New Jersey sent some of finer flavor, more tender and less stringy at 25 cts., and holds there. In bunches half the size of the Western.

Egg Plant.—A novelty appeared: white in color; small and 10 cts. each retail, 7 cts. wholesale. Purple are abundant; the largest 10 cts. retail; the smallest 5 cts.; at wholesale 2 cts. less. Early in the month they retailed at 10 cts. to 25 cts., wholesale 6 and 15 cts.

Green Peas.—In excellent demand and are still in market at 60 cts. a peck retail. Champion lends, Marrowfats are losing in favor.

Lima Beans.—Plentiful and excellent at 35 cts. qt. at first, early in August: now 20 cts. $\frac{1}{2}$ peck.

Tomatoes.—New Jersey and Long Island, 15 cts. qt. early in the month; retail; now 5 cts., and of prime quality.

Melons.—Lackensack appeared Aug. 16, are 15 to 25 cts. each, retail; 8 to 15 cts., wholesale. New Jersey Watermelons are 25 to 35 cts., retail; 15 to 25 cts., wholesale. Georgia Watermelons still arrive in large quantities: 25 to 40 cts. each. Banana Melons bring 50 cts. each, retail.

String and Butter Beans retail at 15 cts.

Cabbages.—Plenty from Long Island: prices at retail Aug. 1, 10 and 15 cts. a head; now 5 and 10 cts.

Cauliflowers.—No fair ones in market, and none expected of fair quality before Oct. 15. They sold at 30 to 45 cts. each at retail, Aug. 1; now 10 and 15 cts. a head.

Beets and Carrots, retail for 2 cts. a bunch.

Beets and Carrots, retail for 2 cts. a bunch.

Squash.—New Marrow are just in market at 15 cts. each, retail; Summer Squash 5 cts. retail.

Pumpkins.—Russian and White early in the month.

Mushrooms.—Hot-house Mushrooms ceased coming to market the first week in August. They grew scarce rapidly, rising from 75 cts. to \$1.50 lb.

Field Mushrooms appeared the 18th, at 35 cts. lb. retail; now 25 cts. qt. and not plentiful.

Onions.—Long Island red and white brought 10 cts. qt.; now 5 cts. retail.

Green Peppers and Cucumbers are both one cent each, retail.

Green Corn.—Is large and sweet. The "Mammoth Sweet" brings 15 cts. doz. retail. Field Corn is 10 cts. doz. The first from Burlington and Hackensack, N. J., brought 30 cts. doz., then 25 cts. retail; Field Corn of market the first week in August, has appeared again; 15 cts. $\frac{1}{2}$ peck, retail.

NOVELTIES.

Under this heading we propose to notice all new varieties of Fruits, Vegetables, Flowers, and ornamental shrubs and trees introduced by reliable houses here and abroad. We wish to have it distinctly understood, however, that the fact of a novelty being mentioned here does not imply our endorsement or recommendation of the same. This column is intended merely to serve as a record of the novelties of the day.

VEGETABLES.

Pea.—"Wordsley Wonder," Webb & Sons, Wordsley, England. A scimitar-shaped kind of first quality, is highly spoken of.

Peas.—"Evolution" and "Walton Hero" are named as the best of Laxton's latest seedlings.

Potato.—"Joseph Rigault," M. Rigault, Groslay, France. In the report of the French National Horticultural Society it is spoken of as rivaling the best English and American kinds.

FRUITS.

Strawberry.—"Jewell," P. M. Augur & Son, Middlefield, Conn. "Parker Earl," J. T. Lovett, Little Silver, N. J.; "Buback's No. 5," J. G. Buback, Princeton, Ill. These three varieties are competing for THE AMERICAN GARDEN Premium. Each one has valuable qualities, and the judges will have no easy task in finding out the best.

Strawberry.—"Daisy Miller," Samuel Miller, Mo. The past season's experience did not show this variety to possess sufficient value to justify its introduction.

Strawberry.—"Lower." Originated at Mt. Pleasant, Meb. Of good size and quality, productive. Said to be excellent for home use, but too soft for market.

Raspberry.—"Golden Queen," Ezra Stokes, Berlin, N. J. Probably a seedling, or sport of Cuthbert; it is claimed to be the best hardy yellow Raspberry.

Grape.—"Lucie." Rosebank Nurseries, Nashville, Tenn. Claimed to be "the best Grape in America;" large berry, color and flavor similar to Delaware, bards.

Peach.—"Burke." Originated in Louisiana, and named after Maj. E. A. Burke, director of the World's Exposition.

Plum.—"Krob." P. A. Krob, Anna, Ill. Supposed to have been introduced from Germany; is considered erenilio proof, and especially suited for the Northwest.

Apple.—"Josephine," Isaac S. Kimball, Washenaw Co., Mich. Said to be a cross between Tallman Sweet and Greening, a very desirable late Sweet Apple, resembling Newtown Pippin and Greening.

Apple.—"Elise Rathke." A. Rathke & Son, Praust, Germany. The tree is of a peculiar weeping habit, valued not only for its ornamental appearance but also for the excellence of its fruit.

FLOWERS.

Geranium.—"Golden Dawn." Fallock & Thorpe, Queens, N. Y. Raised by John Thorpe, president of the Society of American Florists. Flowers of a warm orange-yellow color, more decidedly yellow than any Geranium heretofore known.

Pink.—"Alexandre Regnier." M. Regnier, Fontenay-sons-Bois, France. Described as robust and very hardy, flowers sulphur yellow, numerous produced, borne on strong stems, and never burst.

Narcissus.—"Sir Watkins." James Dickson & Sons, Chester, England. F. W. Birbridge considered it "the finest of all the peerless Narcissuses."

Begonia.—"Prince Henry." Sutton & Son, Reading, England. A new hybrid variety, extremely interesting and pretty on account of its being a cross between a seedling of the tuberosis *B. Darisi* and one of the Rex section. Was awarded a first-class certificate by the Royal Horticultural Society.

Begonia.—"Piootee." H. Cannell & Sons, Swanley, England. A double tuberosis variety with cherry-red petals having a well defined edging of white. Flowers very large. Was awarded a first-class certificate.

Rhododendron incarnatum floribundum.—James Veltch & Sons, King's Road, Chelsea, London, S. W. Remarkable for its free-flowering tendency, and its numerous clusters of delicate rose-pink flowers. Received a first-class certificate.

The Vegetable Garden.

SEASONABLE HINTS.

Selecting Potatoes for Seed.—The proper time for selecting seed Potatoes is when digging the crop. Every careful observer will have noticed that there is considerable difference in the yield of different hills of the same variety and under apparently exactly the same conditions. This individual or family prolificacy, so to say, seems to be inherent and capable of being perpetuated.

Recent experiments at the N. Y. Agricultural Station have shown that the smallest tubers from the most productive hills yield more crop than the largest tubers from the least productive hills, thus indicating very clearly that in order to increase the yield of Potatoes it is only necessary in digging to expose the hills separately, and then go through and select seed from those hills which show the most abundant crop.

Sweet Potatoes should be dug and stored before cold weather sets in. They are far more tender than common Potatoes, and a frost that would not affect the latter in the least, when in the ground, might ruin the first. If permitted to remain long in cold, wet soil after they are ripe their eating as well as keeping quality becomes greatly injured. They should always be well dried before housing, and stored in a dry, warm place. A Sweet Potato that has been exposed to frost is not worth carrying home.

Spinach is one of the most delicate vegetables, and coming at a season when there are very few other "greens" it is the more highly appreciated. Sown now in a cold-frame, it becomes fit for use during the winter months, and if in the open ground it will be ready with the earliest spring. It requires rich, deep soil, and in the Northern States some light winter protection. For filling some odd spaces in the kitchen garden at this season there is nothing more suitable than the Spinach.

Cold Frames should now be made ready. Cabbage, Cauliflower, Lettuce, etc., when desired to winter the plants, have to be sown about the middle of this month.

The raising and wintering of cold-frame plants is not held in as much favor as formerly. The process requires a good deal of labor and attention, and plants started early in spring in a hot-bed or plant house, and afterward pricked out like cold-frame plants, give, as a rule, as much satisfaction.

Celery, when earthed up too early, is liable to rot. It is therefore not advisable to hill up more than what is wanted for early use. In drawing the soil around the stalks care should be taken not to allow any earth to come into the heart of the plant.

Tomatoes are destroyed by the first frost. A few bushes may sometimes be saved by throwing sheets or matting over them when frosty nights threaten.

Melons in Georgia are quoted at twenty-five cents a dozen.

After trying every known method of raising Celery, the editor of the Rural New-Yorker gives the preference to shallow trenches—say six inches deep.

CORN SALAD.

The name of this plant is probably derived from the custom of sowing the seed in the fall among Wheat, which is generally called "Corn" in Europe. In the genial soil and climate there, it attains sufficient maturity for fall and early winter use, and the young grain affords ample protection to preserve the remaining plants through winter. Corn Salad, or Feticus, under which name it is also known, is used as a substitute for Lettuce, and in places where there is a demand for it—as exists in most large towns and cities—it may be made a remunerative garden crop in a small way.

Sown in spring in moist land it seldom fails to grow and mature an abundant crop according to the richness of the soil, but as it runs to seed very rapidly in spring and there are so many other kinds of salad at that season that take its place the demand for it there is but small. Early fall sowing matures a crop for fall or early winter sales, and is therefore best in all respects. The vitality of the seed is very uncertain. Only the very best and fresh seed should be used; two-year-old seed is useless. In the dry soil and atmosphere of August and September, the seed comes up slowly, and must therefore be sowed thickly and then be trodden

CORN SALAD.

down with the foot to compact the soil and keep out the air. I have known some of the seeds to remain in the ground more than six weeks before germinating under unfavorable circumstances.

The early frosts of autumn which kill the weeds do not injure the Corn Salad, which when full grown in the fall is a very marketable crop. I market it in crates and baskets, the same as I use for Strawberries.

The price is \$1.00 or \$1.25 per doz. baskets. Its quality varies considerably according to the soil and care it receives. Properly grown on rich land and in full leaf it is a very paying crop, but has a certain limit to its sale.

In a light soil its staving qualities are fully equal to Spinach; and I have cut it from the open ground in the latitude of Boston as late as December. On the approach of severe winter weather, I have been able to cut and keep a few bushes over in a cold pit; keeping it sometimes a month in that way.

Some experiments, which I made, in sowing the seed broadcast together with Clover and grain have not proved very satisfactory, the plants having either been smothered, or injured by frost. Sowing in drills 15 inches apart and dropping the seeds about one inch apart in the rows is much to be preferred. After sowing, it requires hardly any care or culture, if soil and weather are favorable. It is generally grown as a second crop, and needs no preparation for market except careful washing.

W. H. BULL.

THE PEA.

NOTES ON VARIETIES.

One of the questions that we are most often called upon to answer by visitors to our large garden, is, Which is the earliest Pea? As to be earliest, means to be most popular, the candidates for this honor are naturally numerous and ardent. In seeking to mete out justice to all, I have found it necessary to answer a second question, perhaps still more difficult than the first; viz., what constitutes a variety? Perhaps some of these numerous names offered are counterfeits. After much reading, thinking, and querying, I have settled upon an answer to this latter question, not because it is a perfect one, but because it is the best that I can find. It is this: the plants of two different varieties must differ more in their characters, than do normal individuals of the same variety. Otherwise, they are synonyms, and cannot be admitted as distinct sorts.

Applying this principle to our early Peas, I find it makes sad havoc with the names. It is like throwing a bombshell into the midst of a company of soldiers. It cuts mercilessly. Let us see. If my definition is right, the following names are all synonyms: Philadelphia, Philadelphia Extra Early, Extra Early Philadelphia, Cleveland's First and Best, Cleveland's Rural New Yorker, Dexter, Thornburn's Extra Early Market, Landreth's Extra Early, Ferry's First and Best, Sibley's First and Best, Thornburn's First and Best, Henderson's First of All, Hancock, and I judge from one season's trial that Vick's Extra Early must be placed in the same rank.

No, my judgment is *not* superficial. I have spent hours among these Peas. I have viewed the rows side-wise and end-wise. I have noted the height of their stems, and the color of their foliage. I have measured their pods, their internodes, and their peduncles. I have examined their stipules, and leaflets and tendrils. I have counted and tasted their Peas. As to their earliness, sometimes one is ahead and sometimes another. I find no regularity in this respect. The extremes for the whole of them are no more than I have found in different plantings of the same variety. I repeat; either my definition is wrong, or else these names must go into the contest as one.

To do this Pea justice, it is at the present time as early, as prolific, and as good as any early Pea we have. I am not sure but it is the *best* very early Pea. It has two very powerful rivals in the "Earliest of All" and the "Express," two blue-seeded sorts. It is sufficiently tall to need bushing, has pale foliage and matures its crop in a remarkably short time. Very possibly this many-named sort has been obtained by long continued selection from the Daniel O'Rourke, which it much resembles, and through this, from the Early Kent, from the old Early Frame that our great-grandmothers grew.

Passing down the line, the American Wonder leads the van among the wrinkled Peas. We have here the combination of the very best quality with a very high degree of earliness, together with a plant so dwarf that it needs no bushing. I do not regard its extreme dwarfness as very much to its credit, as it requires much room and much seed to grow plants and Peas enough for

a family. Notwithstanding, its popularity at the present is unexcelled.

A little later come Horsford's Market Garden, and the Stratagem, two Peas that I suspect it will be difficult to surpass. There are equal to these, but I have not found their superior. The former grows about two feet high, has a strong stem, and deep green foliage. The pods are usually recurved, very plump, rather short, but borne in great abundance. It is claimed that this Pea matures its crop very early, but with me it has not done so. The Stratagem is quite distinct, through its compact, waved, deep-green foliage, very strong stem and peduncles, and its very long, recurved pods. Both these varieties are wrinkled Peas.

For a very late family Pea, I have been pleased with McLean's Premier. It is a tall-growing variety, which to some is an objection. It has the advantages of being very prolific, and remaining long in season.

I think the edible-podded Peas need only to be better known to be more appreciated. They seem to be very little grown, and yet I think that when rightly used, they form a very agreeable change from the common varieties. Doubtless those who attempt to use them make the mistake of allowing the pods to become too large before gathering. These should be used younger than those of the common Pea. The Edible Podded Butter is

RED TOP STRAP LEAF TURNIP.

perhaps one of the best of this class. It is very distinct in having the sides of it very sweet, tender, fleshy pods nearly or quite an eighth of an inch in thickness. The plant grows about two and a half feet high, is rather early, matures its crop slowly, but is not very prolific. We received the seed of this variety from France, and I am not sure that it has been offered in this country. Another excellent dwarf early variety of this class is the Dwarf Gray Sugar, which is offered in several of the catalogues.

To those who are fond of the curious, the Large White Podded Sugar Pea will be quite interesting. The immense pods are often five inches long and an inch in width. They are twisted and contorted in a singular manner, and are sometimes inflated, as if blown up. Of course the Peas do not nearly fill them. The pods when at the edible stage are almost white. This Pea is probably more curious than useful, as it is by no means prolific, and I think it inferior in quality to many others.

"ELM."
New York Agricultural Experiment Station.

A moderately fertile soil is most suitable for Tomatoes. A surplus of manure stimulates leaf growth to the detriment of fruit.

Ice water did not prove effectual in destroying the Cabbage worms at the N. Y. Experiment Station. Pyrethrum (Buhaeh) is still considered the most effectual remedy.

TURNIP CULTURE.

Turnips are generally divided into two classes, the English and Swedish or Ruta Baga, and the former are further classified as white or yellow-fleshed. The English Turnip is tender, light and juicy, of very rapid growth, reaching maturity in six or eight weeks, while the Ruta Baga is close-grained, solid, and requires pretty much the whole season for its full development. The Turnip is extensively grown as a field crop, but as a garden vegetable it fills a

EARLY FLAT DUTCH TURNIP.

place not occupied by anything else. In almost all gardens there are some vacant spaces left after the earliest crops are gathered, and I do not think that they can be planted with anything more profitable than Turnips.

To obtain tender and juicy Turnips it is essential that they should make a rapid growth, and to insure this it is necessary that the soil should be both rich and deep. It is customary with some to sow in the same rows that the previous crops have occupied. This is a very good plan if the ground has been well manured for the first crop, but generally it will be found preferable to give a good dressing of manure, ashes, or guano and to thoroughly incorporate with the soil. After the ground has been prepared and neatly leveled, the seed should be sown in rows, the rows being from one-and-a-half to two-and-a-half feet apart. If the cultivator is to be used the latter distance is preferable, for convenience sake.

The sowing should always be done just before a rain if at all possible, as this insures a quick germination of the seed, a rapid

YELLOW ABERDEEN TURNIP.

WHITE EGG TURNIP.

growth, and a consequent escape from the Turnip fly, which proves so destructive during hot, dry weather. The plants will be safe from this insect as soon as they attain their rough leaves, but in the event of its appearance a slight dusting of lime, soot, or ashes will prevent its destroying the crop; the best plan, however, is to sow an abundance of seed, and if the plants stand too dense of seed, and if the plants stand too thick they can easily be thinned when hoeing. When the thinning is finished the plants should stand four inches apart, and

In order to obtain a rapid growth the ground should be well worked and kept loose at all times.

To keep Turnips perfectly sound they should be taken up, in the vicinity of New York, about the 7th of November, or before severe frosts set in; cut off the tops to within half an inch of the bulb, place in a cool, dry cellar, and cover with sand. Thus protected they will keep fresh until February. Those for spring use may be preserved out-doors in a dry situation, care being taken to place them in a conical form. Cover them with an inch or two of straw and a foot or 18 inches of earth, and when opened in the spring they will be found perfectly fresh.

Some 25 or more varieties of English Turnips are enumerated in the catalogues of our seedsmen, the most desirable of which for general cultivation are the following:

Early Flat Dutch. This is a Turnip of medium size, pure white color, and of quick growth, but when overgrown, spongy and inferior. It is good only for early fall use.

Red Top Strap Leaf will form good-sized Turnips, when all is favorable, in about eight weeks from sowing. It is perfectly flat, with a small, tap root, and a bright purple top, fine-grained flesh and is a well-known and general favorite. The *White Top Strap Leaf* is a variety of this, differing only in its

GOLDEN BALL TURNIP.

being of a pure white color in skin and flesh.

Long White or Cow Horn is one of the best for general cultivation. It grows very quickly to a large size, in shape resembling a Carrot. It stands half out of the ground and has small tops; it is an excellent keeping sort if gathered before very severe frosts.

White Egg in appearance and quality is entitled to a high rank. It is a very desirable fall variety and is an excellent keeper for winter use. It is perfectly smooth, of a pure white color, and excellent flavor. It grows half out of the ground, and at times almost as large as a Ruta Baga. Decidedly one of the most desirable.

Robertson's Golden Ball is one of the best of the yellow-fleshed varieties for the general crop. It is very solid and keeps well.

Large Yellow Globe somewhat resembles the above, but grows to a much larger size.

Yellow Stone is of medium size, very firm and of good flavor. It is an excellent keeper and a very popular table sort.

Turnip seed can be sown at any time from the middle of July until the first of September, but I prefer to commence sowing about the first of August with the best keeping varieties, retaining such as the *Early Flat Dutch* until about the first of September, and as the great value of a Turnip consists in its rapid growth, I do not think that there is any advantage gained by sowing earlier.

CHAS. E. PARNELL.

The Fruit Garden.

SEASONABLE HINTS.

Keeping Apples.—A most important factor in the keeping qualities of Apples—and one that is frequently lost sight of—is the condition of the fruit at the time of picking. The more carefully fruit is handled the better it will keep; the slightest bruise or injury of any kind engenders decay.

The best time for picking Apples is just before they are fully ripe; full maturity lessens their keeping quality fifty per cent. An Apple that drops off the tree by a light touch is too ripe for long keeping.

It is one of Nature's immutable laws that fruit, so soon as it has become fully matured, shall decay. This process, although it may commence and progress very slowly, is sure to take place if the fruit is left to natural conditions, and every preserving method aims to furnish means which shall counteract or protract this natural tendency.

To accomplish this, expensive fruit houses and other devices have been invented, the experience with all of which goes to show that, other conditions being equal, a low temperature, ranging from 30° to 36° and never above 40°, is the primary and principal condition of success. Everything else is of comparatively little importance. In whichever way such a temperature can be provided most cheaply will generally be found most suitable.

Extreme dryness of storage was formerly considered of great importance, but later experience has proved the fallacy of this supposition. In fact, it has been found that, if the temperature is kept low enough, Apples will keep better in a damp than in a dry atmosphere. We know of several instances in which Apples placed completely under water have kept in good condition all winter, and but a few weeks ago we have eaten Apples that have stood under the drip of an ice house for nearly a year, and that were as fresh and sound as when picked off the tree last September.

Only when existing conditions do not admit the lowering of the temperature to the most desirable degree, becomes dry storage more advantageous.

SPECIAL FERTILIZERS FOR SMALL FRUITS.

In every normally matured plant are found certain mineral elements which, though comprising only a very small percentage of its entire mass, are still regarded as absolutely essential to perfect vegetable development. The relative proportion of these so-called ash constituents varies considerably in different classes of plants and even in individuals of the same class growing under different conditions. Just what the particular function of each element is, is not well understood, but there is little doubt that they have their special work to perform. Their invariable presence and varying proportions form the basis on which the scientific idea of special fertilization rests.

It was observed that changes in the proportions of the ash constituents were accompanied by corresponding changes in the organic compounds of the plant and consequently in its quality. This naturally sug-

gested the query: How far is it possible to artificially control the proportions of the mineral elements, and in so doing to modify the quality of the plant or its desirable parts? In other words, To what extent is it possible and profitable to fertilize plants for special purposes? Until within a few years horticulturists have been slow to receive these ideas, though they have been successfully applied in general farming. The desirable qualities of Tobacco are known to increase with the increase of potash in its composition, and the best Sugar Beets are grown by special manuring with potash compounds.

To ascertain if similar conditions obtained in fruit culture, a series of experiments were begun about ten years ago at the Massachusetts Agricultural College by Prof. Goessmann. The plan included a study of the characteristic chemical features of our common fruits and the effect upon them of treatment of the plants with special fertilizers. The experiment began with the Grape. A wild specimen of *Vitis Labrusca* (our common wild Grape) was torn apart at its root: one-half was left in its natural condition, the other transplanted to cultivated ground and treated with nitrate of potash and bone superphosphate. At the end of three years fruit from the cultivated vine contained twelve per cent more potash and twenty per cent more sugar than that from the wild one. A cultivated variety, the Concord, although already in a highly developed condition, was placed under the same treatment and responded in a similar manner with increased quantities of potash, phosphoric acid and sugar.

Like experiments with Apples, Pears, Peaches, Plums, Cherries, Currants (see Bulletin No. 7, of Mass. Experiment Station), Raspberries and Blackberries have been completed or are now going on.

The study of the Strawberry, which may serve to point the moral of this article, was begun by an analysis of the fruit of a cultivated variety, the Wilder, grown without special attention or fertilization. It is given in comparison with an analysis of the fruit of the wild native species, *Fragaria vesca*, by Richardson. The cultivated fruit gave 0.41 to 0.63 of one per cent of ash: the wild, 0.41 of one per cent. This ash had the following composition:

	Wild fruit. <i>F. vesca</i> .	Cultivated fruit. Wilder.
Potassium oxide	22.06	49.24 per cent.
Sodium oxide	20.79	3.23
Calcium oxide	14.88	13.47
Magnesium oxide	trace	8.12
Ferric (Iron) oxide	6.07	1.74
Phosphoric acid	14.47	18.50
Silicic acid	12.62	5.56

The striking difference in the composition of the two may be ascribed to the cultivation and selection undergone by the Wilder. The soda, lime and iron have decreased and the phosphoric acid increased, but most remarkable is the enormous increase of potash, which is more than doubled in quantity.

But the change was not confined to the mineral elements alone, for the same analysis showed that the proportion of sugar to acid in the wild species is as two to one, while in the cultivated varieties it is increased to six to one or more.

The next step was to ascertain how far the effect of ordinary cultivation could be

improved upon by special treatment. Five plats of ground planted with the Charles Downing, received the following special fertilizers:

No. 1. Bone superphosphate and nitrate of potash.

No. 2. Nitrate of potash and kieserite (sulphate of magnesia).

No. 3. Bone superphosphate, nitrate of potash and kieserite.

No. 4. Not fertilized.

No. 5. Bone superphosphate, nitrate of potash and muriate of potash.

The ash of fruit grown upon these plats had the following composition:

	1	2	3	4	5
Potassium oxide	62.13	56.73	61.81	58.47	62.29
Calcium oxide	12.56	14.12	12.21	14.64	12.46
Magnesium oxide	5.96	3.29	6.00	6.12	6.33
Ferric oxide	2.32	5.77	3.64	3.37	2.50
Phosphoric acid	17.02	20.09	16.34	17.40	16.42

(In these results the soda and silica are omitted as of little importance and difficult to accurately determine. This makes the relative percentages of the remaining constituents somewhat higher, but their relation to each other remains unchanged.) The effect of the special fertilizers is easily traced: The potash shows a decided decrease in No. 4,—unfertilized, and is highest in No. 5, which received the largest application. The well known effect of magnesia in diffusing potash through the soil, and beyond the reach of surface feeders like the Strawberry is apparent in plot 2, by the decrease of potash in the fruit. Wherever the potash increases the lime decreases and vice versa.

The facts obtained with the Strawberry were brought out with equal or greater force in the other fruits mentioned. The results all point in the same direction. Preliminary analyses show that the chief mineral constituent of our fruits is potash—usually from forty to fifty per cent of the ash.

Application of potash compounds to the soil has in every case increased the percentage of potash in the fruits, attended by a corresponding decrease of the lime: the use of fertilizers rich in other ash constituents either singly or together, fails to produce a like increase in their percentage in the fruit. The inference is that the mineral element in which ordinary soils are chiefly deficient to the demands of so-called small fruits is available potash, especially since the natural proportion of this element in fruits is so unusually large. One step further brings us to a practical application of this knowledge.

Potash fertilizers have decidedly improved the desirable qualities of fruits. Wherever the percentage of this element has been raised the change is accompanied by an increase of sugar and decrease of acid. This it is hardly necessary to say is an important and desirable change—a matter of dollars and cents. Other things being equal, the fruit with the largest per cent of sugar will bring the highest price. Moreover, less desirable varieties may be brought up to a higher standard, thus giving value to some good quality, as hardness or prolific bearing.

The fact that the quality and character of garden and orchard products can be modified by the effect of special fertilizers is of immense importance in its practical as well as scientific bearing.

WINTHROP E. STONE,
Mass. Agricultural Experiment Station.

THE JEWELL STRAWBERRY.

For the past two seasons we have watched this new Strawberry with considerable interest, and the more we saw of it the more favorably did we become impressed with its valuable qualities. The Jewell is a seedling of either Jersey Queen, or Prince of Berks, raised in 1880 by P. M. Angur & Son, Middlefield, Conn. From the first year of its existence the plant showed unusual vigor and productiveness, which qualities it has so far retained sufficiently to justify its introduction for general trial and use.

The flowers are pistillate; berries large to very large, of good uniform size, mostly obtuse-conical, rarely irregular; very handsome and firm, color bright red changing to crimson when fully ripe; quality good and highly satisfactory to the taste of most people, and although not possessing a high degree of aroma, it is entirely free from the acidity so objectionable in our leading market berries; foliage large, vigorous, healthy, and free from blight; season medium to late, holding out remarkably well.

Its productiveness under good cultivation is simply enormous, while even under less careful treatment it will yield very large crops. From one-twenty-second part of an acre on the originator's grounds were picked during the season, 678 quarts, making a yield of 14,916 quarts, or 466 bushels per acre. As this does not include the many berries and bunches picked by visitors, the number of which was very great, it may be safe to assume that the entire product, if it could have been measured, would have been not less than five hundred bushels per acre. On many similar plants we have counted over 100 berries, and we have seen a full quart of berries picked from a single plant at one picking. True, these wonderful results were obtained under most favorable conditions, exemplary cultivation, and by occasional irrigation, nevertheless on other parts of the farm, under less careful treatment, the yield was proportionately large. The same was the case in New Jersey where we have seen the plant

under entirely different conditions, as well as on our own grounds in Westchester Co., N. Y.

Taking all points together we do not know of a recently introduced variety that has been so extensively tested, and made so many friends wherever known. Its only weak point—if such it may be called—is that it stands rather below the highest standard of quality, but in this regard it should be remembered that all varieties of Strawberries were deficient in flavor this year, and that the berries exhibited by the originator were grown under irrigation, which, as it is well

ABOUT FIG TREES.

"Will Fig trees that are planted out in the garden bear better than those that are grown in boxes, and wintered in the cellar; how deep should they be planted; and in burying for winter should they be first covered with straw, or with earth only?"

Answer by Wm. Falconer.

Fig trees planted out bear better than those in boxes, and with far less trouble. You are more certain of a crop from young plants that are grown in tubs or boxes than you would be from the same sized or aged plants that are planted out, but the out-door plants can become large bushes, hence have more fig-bearing wood than box-grown ones. All the care the out-door Fig trees need is to bend them down and peg them flat to the ground, and bury them about a foot deep with earth in the fall, and unearth them again in spring. My neighbor, Mr. Barlow, on Long Island, gets enormous crops off his Fig trees, treated in this way.

When planting Fig trees plant as you would any other bush or shrub; shake the earth from the root and spread them out. There is nothing delicate about the rooting of a Fig tree. It roots easily. In burying for winter, use earth only. Straw or litter would be cosy winter quarters for field mice, and peeling the Fig trees capital amusement for the mischievous rodents.

SHORT OUTTINGS.

Peach Borers lay their eggs on the bark of Peach trees, near the base of the stem, during July and August. The young larvæ as

soon as hatched work their way into the bark, and now, before they have had time to do much harm, they should be dug out and destroyed. By covering the cuts thus made, and mounding earth around the stem, the wounds will soon heal.

Black-cap Raspberries root from the tips of the new canes, and when it is desired to propagate them largely, the ends of the new shoots should be layered, that is, covered with some soil, not more than is sufficient to hold them down, although some tips will take root without this precaution.

THE JEWELL STRAWBERRY. FULL SIZE BERRY, AND BUNCH REDUCED ONE-THIRD.

known, deteriorates the quality of fruits. Berries from our own grounds, a rather stiff, clay loam, were of much better quality, improving as the season advanced. Compared with the Wilson, Crescent and other market varieties of this class, it is certainly a very great advance, and as a variety for home use it cannot but please far the largest majority of consumers.

Our illustration is an exact photographic representation of a bunch, reduced one-third of its natural size; the single berry shows a selected specimen of actual size.

The Flower Garden.

SEPTEMBER.

Sweet is the voice that calls
From babbling waterfalls
In meadows where the downy seeds are flying;
And soft the breezes blow,
And eddying come and go
In faded gardens where the Rose is dying.
Among the stubbled Corn
The blithe quail pipes at morn,
The merry partridge drums in hidden places,
And glittering insects gleam
Above the reedy stream,
Where busy spiders spin their filmy laces.
At eve, cool shadows fall
Across the garden wall,
And on the clustered Grapes to purple turning;
And pearly vapors lie
Along the eastern sky,
Where the broad harvest-moon is redly burning.
Ah! soon on field and hill
The wind shall whistle chill,
And patriarch swallows call their flocks together,
To fly from frost and snow,
And seek for lands where blow
The fairest blossoms of a balmy weather.
The cricket chirps all day,
"O fairest summer, stay!"
The squirrel eyes askance the Chestnuts brown-
ing:
The wild fowl fly afar
Above the foamy bar,
And hasten southward ere the skies are frowning.
Now comes a fragrant breeze
Through the dark Cedar trees,
And round about my temples fondly lingers,
In gentle playfulness,
Like to the soft caress
Bestowed in happier days by loving fingers.
Yet, though a sense of grief
Comes with the falling leaf,
And memory makes the summer doubly pleasant,
In all my autumn dreams
A future summer gleams,
Passing the fairest glories of the present!

GEORGE ARNOLD.

SEASONABLE HINTS.

The cooler nights of September remind us of the more or less severe frosts apt to occur in the latter part of the month, and to lay low the tender treasures of our flower-beds.

Geraniums, Roses, Lantanas, and all plants of the hardier class that are simply to be kept dormant during winter, need not be taken up for some weeks yet, but such as we wish to have in bloom in winter have to be potted without delay. Only young plants should be used for this purpose; those raised from cuttings this spring make the best winter-blooming plants. With older plants all straggling branches and old wood have to be cut off, and other shoots should be shortened in so as to induce a stocky, bushy growth.

At the approach of cold weather potted plants should be placed in a cold-frame, an old hot-bed, or on a sheltered piazza where they can be protected against early frosts and may be kept safe until severe cold sets in, when they have to be removed to the house.

Spring-flowering Bulbs may be planted now or at any time before the ground freezes, but whichever time is chosen the sooner the ground is brought in readiness the better. This should be done by making the soil as mellow, deep, and rich as possible.

Violets may be planted in frames at any time this month. Remove all runners, do not throw strength into the crown, do not protect the plants in any way, and water copiously when needed.

ANEMONES AND RANUNCULUS.

The bulbous or Asiatic species of these beautiful plants are not reliably hardy in the Northern States, and must be kept secure from freezing. They need rich, moist soil, well drained though, and heavy mulching in winter, if grown in an open bed. A better way is to grow them in a cold-frame like Pansies, Daisies or Violets.

In summer after blooming, when the leaves have died off, the ground over the roots should be shaded with slats, brush, or a mulching of manure or litter, which is to be removed, however, when the plants begin to grow. Or, after blooming, the roots may be lifted and stored in sand during summer. Plants raised from seed in spring, blossom freely the following year.

HARDINESS OF LILIES.

One of the principal causes of failure in the cultivation of Lilies lies in over-estimating their hardiness, their power to endure the rigor of our winter, and failure wholly due to this is attributed to some unknown cause. Mr. C. L. Allen, who has made a specialty of Lily culture and who has devoted considerable study and careful observation to this subject, considers these mistaken ideas about the hardiness of Lilies as the greatest impediment to their more extended culture.

It is generally supposed, he said before the N. J. Horticultural Society, that all the various species of Lilies, with few exceptions, are "perfectly hardy," because they are natives of cold or temperate climates. A more erroneous opinion, or one fraught with so much danger to the plant, could not be entertained. The species that are truly hardy in this climate, other than those indigenous to the soil, are but few; indeed, they are the exception, not the rule. While it is true that some of the species are found in the coldest parts of the habitable globe, growing most luxuriantly, it is equally true those same species grown here are not hardy to that degree which renders it safe to plant them in our borders without protection.

There is no climate so severe on all bulbous-rooted plants, such as are usually considered hardy and left in the open border during the winter, as ours. This is particularly applicable to the coast, from Massachusetts to Virginia, where the thermometer often indicates 40° of frost when there is not a particle of snow on the ground for its protection. Here the frost penetrates the earth to a great depth one week, and is entirely out the next.

These constant changes from freezing to thawing cause the earth to contract and expand to such a degree as to frequently tear the bulbs in pieces. I have had whole fields destroyed in this manner. But let us be more specific. Take the beautiful little *Lilium tenuifolium*, a native of Siberia, and where it is largely grown as an article of food in its native habitat, it is perfectly hardy; here it is not. Why? Simply because in its Siberian home the first indication of winter is a snow-storm that covers the ground so deeply that frost rarely, if ever, penetrates it at all; while here the earth is frozen to a depth entirely unknown there notwithstanding their climate is much the colder of the two. The same is true of the *Lilium Martagon*, the bulbs of which are

largely used by the Cossacks as an article of food; with them it is perfectly hardy; with us, in a much milder climate, it will rarely survive but a single season unless protected; and with that precaution, it grows with more vigor here than in its native home.

In Vermont, where the ground is nearly always covered with snow during the winter season, all kinds of Lilies grow to the greatest perfection. I have seen finer bulbs of the *L. auratum*, *Brownii*, *Chalcedonicum*, *Martagon*, and other species grown in that State, without the slightest artificial protection, than I have ever known produced in any other country. There the *L. auratum* is always healthy, and increases as rapidly as any of our native species.

There are many other plants protected by the snow in a similar manner. We notice on the Alps, at an elevation that permits of only four months of spring, summer and autumn, the *Primula Auricula* grows in the greatest luxuriance and profusion. It is there constantly covered with snow during their long periods of freezing weather. In the valleys below, where there is no snow and but light frost, the same plant will not live through the winter unless carefully protected.

It is not so much the cold that injures and destroys the bulbs, as the effect of the cold which disintegrates them by alternate freezing and thawing. I have often had bulbs of the *tigrinum*, *umbellatum* and *speciosum* remain on the surface during the winter without their being injured in the slightest degree, while those in the ground were completely destroyed.

The question may be asked, and it is a pertinent one, "Do not our native Lilies have the same elements to contend against as those not indigenous to our soil, and having them, escape uninjured?" Certainly, yes; but nature always protects her own, and in collecting our native species we see how wisely and beautifully it is done. The *superbum* is rarely found, excepting in woods or marshy grounds; the low-growing trees or shrubs form a complete net-work of roots above and beneath the bulbs, affording the most ample protection against the action of the frost, should it penetrate the heavy mulching of leaves that nature has provided for their protection. The *Canadense*, or common Lily of our meadows, forms its bulbs very deep, usually beyond the reach of frost, and has for a covering a heavy turf, than which there can be no better protection. This Lily, in our cultivated fields, is by no means hardy.

Whatever may be the cause of failure, I am certain from my experience and observation that, where Lilies are protected so that frost cannot reach them, they will invariably succeed and thrive in proportion as the other conditions of growth are more or less favorable; while those left unprotected, if in exposed situations, are quite as sure to die.

The protection of a bud of Lilies is a simple and inexpensive operation. The best and most natural mulching I have ever used is a covering, say six inches in depth, of newly fallen leaves; those kept in their places by a little brush, or pieces of board. Sill or marsh-hay is also an excellent protection; Corn-stalks answer a good purpose; or whatever material is most convenient.

TRITOMAS.

For the production of brilliantly striking floral effects in the autumn flower garden few plants are more desirable than the Tritomas or Flamo Flowers. There are about half a dozen species, all natives of South Africa, but the most showy, and the one most frequently seen in cultivation, is *Tritoma Uvaria* and its beautiful improved variety the *grandiflora*.

The Uvarias are half-hardy, herbaceous plants, which, with a good mulching, live out doors through the winter, in the latitude of New York. They thrive best in a light, dry, deep soil, in a somewhat sheltered situation; and may be increased readily in spring, by the quite numerous suckers thrown out from the roots.

Planted in separate clumps in the lawn, or among shrubbery, their large, upright spikes of drooping, orange-red tubes are highly effective, and blooming during autumn, till early winter even, when there are but few flowers to cheer and brighten our gardens, they occupy a place undisputed by any competitor.

CANNAS.

If proper care has been given, Cannas are now in their glory, and when well grown there are few sub-tropical plants more suitable for the adornment of lawn or flower garden. The Cannas are natives chiefly of the West Indies and South America, although one or two species are found in South Carolina and Florida, while others come from China and the East Indies.

The fleshy corms or roots of some kinds are used as food in South America, and in the West Indies *C. edulis* yields the farinaceous substance—known as *tous les mois*, a kind of arrowroot, while the seeds of Indian Shot—*Canna Indica*, have been used as a substitute for coffee. On account of their beautifully veined and marked large leaves, and their picturesque habit of growth, they mass very advantageously with shrubs and dwarf sub-tropical plants.

In small gardens, however, Cannas will show to better advantage if planted in groups of three or five plants, or grown as single specimens in vases, with drooping plants around the edges. The hotter the season the better they will grow, and will throw up large spikes of flowers during the whole summer, and they will retain their beautiful

foliage in spite of winds and storms, until it is cut down by the blackening frosts of the autumn.

Cannas should be planted in very rich garden soil, and may be set out as soon as danger of frosts is past. They will grow readily from seeds, and some of the handsomest varieties are thus obtained. The seeds are encased in a very hard shell which must be softened by soaking them in boiling hot water for at least ten hours. Pour the water over them from the tea-kettle, and set

flora has foliage of a deep, bluish-green, with flowers of a light-orange hue. *C. Adolph Neich* is a dwarf *Canna* with light-green leaves, and flowers of a deep crimson shaded to orange. *C. nigricans* is a very tall variety, growing eight feet in height, with dark-red leaves shaded to copper color, and dark-scarlet flowers. *C. Rendalleri* grows five feet tall, and has very large, orange-scarlet flowers, with long, purple, shaded leaves. *C. Depute Henon* has green leaves with a bluish tinge, and bright, orange-colored flowers.

A very handsome sub-tropical *parterre* can be arranged for a lawn or garden by planting the tall Cannas in the center and the dwarf varieties on the outside of the circle, with an edging of dwarf Asters or Nasturtiums. The roots should be dug up and placed in a box and covered with sand, after the foliage has been killed by frost, and they will winter safely in a frost-proof cellar; but some of them are so hardy that they will winter with only a protection of leaves in the gardens of the Middle and Southwestern States.

DAISY EYEBRIGHT.

CARE OF CHRYSANTHEMUMS.

Chrysanthemum should now be watered liberally, and once or twice a week with weak manure-water. As the branches are very brittle they are much benefited by being tied up to stakes. The tips should not be pinched in any more at this season. If the plants are in the open border, and it is desired to bloom some of them in the house in pots, they should now be lifted and potted, shaded, and showered overhead for a few days, and then exposed to full light again; plunged in the ground, watered freely, and left out doors so long as there is no danger

from frost, when they should be housed.

Rosa Lusitana, which has recently been extensively advertised in Europe as something new and wonderful, and which was sold at \$10 a plant, is, according to Jean Sisley, nothing but the old *Noisette Céline Forestier*, which has already been sent out under the alias of *Liesis*.

On a ranch in Stockton, Cal., 75 car-loads of *Pyrethrum* flowers are said to have been raised last season. They were worth \$125,000 for manufacturing Buhach.

TRITOMA UVARIA.

the cup containing them in a warm place, where it will keep quite hot until the seeds are softened; then plant them in a hot-bed, or in a box or pot of sandy soil, putting a pane of glass over it to retain the moisture. When the tiny sprouts appear, remove the glass so as not to make them wire-drawn.

A great many very beautiful varieties of Cannas are named in florists' catalogues. Among the latest kinds are *C. Ehemanni*, which has long, oval foliage like the Banana, with brilliant red flowers as large as those of the *Gladiolus*, while the flower-stalks are from five to six feet in height. *C. gladioli-*

The Window Garden

AND GREENHOUSE.

THE WINDOW GARDEN FOR SEPTEMBER.

PREPARE FOR WINTER.

We should know what plants we have that are available for winter use, the space and means at our command for wintering and caring for them, and get both plants and place in readiness. We should not allow any of our winter plants to get frozen, nor enervated by cold or wet, at the same time we should avoid housing them too soon or otherwise treating them so as to induce a soft and tender growth. All plants are better outside than inside so long as the weather is favorable, and with a little extra care in the way of lifting them on the piazza at night, sheltered from cold, or at any time from wet or muggy weather, we may be able to keep Poinsettias outside till October, and Geraniums and Callas till possibly beginning of November.

POINSETTIAS

Are very sensitive to cold, especially to cold, wet storms. Under unfavorable circumstances they lose their lower leaves and assume altogether a sickly appearance. Bring them to the piazza, indoors, or any place that is warm and sheltered, but not shaded, for they love the sunlight, before cold weather or chilly nights come. Sprinkle them overhead in the afternoon, water freely but cautiously and encourage an unchecked growth from now till November if you would have large flower heads.

NASTURTIUMS.

Sow some seeds of *Tropaeolum Lobbianum*, or you may obtain plants quicker still if you have old plants, by striking some cuttings; grow them on quickly and vigorously and they will afford you quantities of flowers in winter. For early use cut well back and pot some of the larger plants.

PELARGONIUMS.

Cut back the old plants, lift them and shake away the soil from their roots, and pot them in somewhat small pots. Plunge the pots outside and don't water much, if any, till new roots begin to come freely and the leaf-buds to become plump. Use the soft points of the prunings as cuttings; rooted now they will make nice, large blooming-plants next spring.

Scarlet Geraniums should before now be established in their pots. Those we may pot now will not bloom in early winter.

CHINESE PRIMROSES.

Keep cool, away from warm sunshine, repot as necessary and never allow them to get dry.

METEOR MARGOLDS.

Pot a few small to medium-sized plants, plunge them in an open, sunny place; give them plenty of water and they will bloom nicely between November and New Year's.

BOUVARDIAS.

Cease pinching them. Towards the middle or end of the month lift and repot very carefully, stake each plant, moisten them freely at the root and overhead, and still keep them out-of-doors but in a warm, sheltered place and shaded from sunshine. Don't let them wilt if you can help it.

CALLAS.

As they begin to grow, pot them in well-drained, turfy soil. Keep them sheltered and slightly shaded for a little while, then remove them to a sunny place and give an abundance of water.

CARNATIONS

May be left undisturbed till next month, or, if you wish, you may lift and pot them now, and then plunge them in an open place and water them freely. Propagate cuttings now, winter them in a cold-frame, and plant out next spring, and they should yield a good summer crop of flowers.

CALCEOLARIAS AND CINERARIAS.

Keep cool, shade from warm sunshine, repot before the roots get pot-bound, never allow them to get too dry, and look after snails, crickets and green fly.

PARIS DAISIES, STEVIAS, ETC.

Shift into larger pots if necessary, using very rich, turfy soil, and give abundance of water and weak stimulants. A slight frost will hurt the Stevias but the Daisies are unhurt by three or four degrees frost and, as a rule, may safely stay out-of-doors till the end of October.

MIGNONETTE.

Sow either in pots or frames for winter use. Miles' Hybrid Spiral is about the best.

CYCLAMENS.

If not already done, shake out and repot the old corms and keep moderately inactive for a while. A good place for them is in company with Chinese Primroses. Young plants raised from seed sown last spring should be grown gently and without rest.

GLOXINIAS.

Those that bloomed in pots may be dried off gradually but otherwise not disturbed. Don't give any more water to those planted out in frames, and about the end of this or early next month lift the "roots" out of the frame and store them one layer deep in shallow boxes filled with earth to be kept dry over winter. The "roots" should never be subjected to a temperature under 50°.

BEGONIAS.

Do not let the Rex and other large-leaved varieties get too crowded or wet, else their leaves will rot; repot if necessary the young stock of *B. fuchsoides* and other winter-flowering kinds, give them plenty room and endeavor to secure stocky plants.

EVERGREEN SHRUBS.

Azaleas, Camellias, Oleanders, Bay Laurels, Myrtles, Orange trees, and the like, should be freely washed overhead by hose, syringe or other means so as to insure their immunity from red spiders, thrips and other insect pests. In the event of frost, spread newspapers, sheeting or other light material over them, or take them upon the piazza over night to save them from the frost. A few degrees of frost may not hurt the plants, but bear in mind it would not do them any good, therefore be on the safe side. A sharp frost will injure the flower-buds of Camellias and Azaleas.

CACTUSES.

These curious plants are now "fat" and vigorous, hence an easy prey to rot and rust. Opuntias and Cereuses require no solicitude except protection from frost; Mamillarias and other little delicate kinds should be gathered together where we may save them from being drenched by rain or wilted by cold dews.

FERNS.

Give them plenty of water and shade from sunshine. Keep them outside on the piazza or elsewhere so long as there is no danger of frost. Where the fronds become disfigured by a layer of the scattered "seed," wash it off with a sponge or syringe. If well rooted and in good, thrifty condition, you may repot some evergreen young stock, as the common Maiden-hair, and *Pteris serrulata*, *Oncidium Japonicum*, *Aspidium falcatum* and *Nephrodium molle*, to encourage fresh young growths in winter. But old plants of any sort, and more especially of hardy and half-hardy Ferns, let alone, else you may start them prematurely and so weaken them.

OTHER "GREENS."

Repot or top-dress Smilax, give it extra watering and encourage it to grow. Have a few Rose Geraniums in pots to give you leaves in winter. Plant Club Moss and Tradescantias in the pots containing the other plants. And if you wish for green vines to run about and over your windows have some English Ivy, "German" Ivy, Madeira vine and Cobæa started in pots.

BEDDING PLANTS.

Make cuttings of Zonal Pelargoniums, Ageratums, Coleuses, Iresines, Alternantheras, Abutilons, Hibiscuses, German Ivy, Calceolarias, Lantanas, Heliotropes, get them well rooted before cold weather comes. Old plants require so much room that it will be found more convenient to keep over a stock of young ones than to preserve the old, and by having the young stock rooted early and well established in their pots, they are likely to winter well. Whatever old plants we may wish to keep may be lifted about the end of this month or early next month, cut well back and potted into small pots. I prefer to raise my Salvias, Centaureas and Vincas from seed in spring rather than keep over old or young stock in winter.

WM. FALCONER.

THE PETUNIA IN THE HOUSE.

Last fall, in cleaning up the beds, I came across some small seedling Petunias which looked so healthy and desirous of living a longer time than I knew the cold weather would allow them to, that I selected two or three, and planted them in six-inch pots. They took to their new quarters very readily, and began to bloom shortly after being brought into the house. To one I gave a trellis, another I put on a bracket, and allowed it to straggle about to suit itself, and the third one I kept pinched in well in order to make it as bushy and compact as possible.

All these plants have done exceedingly well, and I shall certainly make use of the Petunia as a plant for winter flowering after this. The plant on the trellis was large enough to fill one ordinary window, and it has been covered with blossoms all the time. The one grown on the bracket has afforded me much pleasure by its graceful habit of growth, and the profusion of its bright magenta flowers, while the one kept pinched in has done a good winter's work in helping to brighten up a stand of Pelargoniums from which no flowers were to be expected during the season. On the trellised plant we frequently counted over one hundred flowers at a time. All the care that was given the plants was to keep the soil moist, and to re-

move all blossoms as soon as they began to fade. If seed had been allowed to form, our crop of flowers would have been scanty.

Considering the little care required and the result in flowers, I have no hesitancy in saying that there is no more satisfactory plant for the house. Other plants which require more care may be more desirable, but the lover of flowers who has but little time to give them will find the Petunia just the thing to make the window gay, and surely everyone can have a Petunia.

E. E. REXFORD.

THE LITTLE GEM FEVERFEW.

The Feverfews of our gardens are among the most valuable plants in the formation of ribbon beds, especially the "Golden Feather" with its bright golden yellow foliage. When used for this purpose the flower-buds have to be scrupulously removed; grown in pots the Feverfews are held in high esteem for cut flowers, during autumn and winter.

The variety "Little Gem," shown in our illustration, is a specialty with Peter Henderson and is a great improvement over the old, straggling forms, for cut flowers. It is very dwarf, growing not over 12 to 18 inches in height, and produces larger and more perfect flowers of pure white.

ROSES FOR WINTER.

Notwithstanding that winter-foreing of Roses is, by all professional growers, considered over-done, new Rose houses are constantly being erected, and persons who had no previous experience are embarking in the business with the expectation of realizing large profits. Much as it is to be desired that the cultivation of flowers of all kinds should increase, we cannot advise anyone to invest much money in a business with which he is not thoroughly and practically familiar. In a recent number of the *German Town Telegraph* a skillful practical Rose-grower gives his views and methods in so concise a manner that they are worthy the careful consideration of those intending to force Roses.

Many people think, he writes, all they have to do is to put up a greenhouse, stick the plants in the ground and they would go on all right and that there was a fortune in it. It is not done quite so easy as all that. Some authors have written whole books on this subject. But it will be impossible for me to write a long sermon here as space will not admit; so I will endeavor to give a few practical hints in as brief a manner as possible, and sum it all up in a nutshell.

To begin with propagation; strong, healthy cuttings should be put in any time from September to January, in good bar sand, over a temperature of 60° or 65°, with the temperature of the house 10° less. It will take from 20 to 25 days to root them.

They are then potted off in two-and-a-half inch pots in three parts good, rotten sod and one of sand, and then placed in a tempera-

ture of about 50° by night with 10° to 15° more in the day time. They should be regularly shifted into larger pots as they become filled with roots, or pot-bound. This is an important matter and should have prompt attention, as if they once get a check in their growth at this early stage it will take them a long while to recover.

Syringing is done once a day to keep down the red spider. Fumigate, by burning Tobacco stems twice a week, to keep down aphid or green fly. With this attention plants which were put in as cuttings at the season named above ought to be two feet high by July, with roots enough to fill a six-inch pot; if intended to be grown on continuously in pots a shift into an eight-inch pot will be required by the first of October to flower them in; if intended to be planted out on benches or solid beds of soil, this should be done about the middle of August.

Some people go to a good deal of trouble

to completely saturate the soil, and then about every two weeks after, during the months of June and July, they should be allowed to dry off sufficiently to lose their leaves, and then pruned and started into growth gradually at first, for the next season.

To grow Roses successfully it is very necessary that the houses should be especially constructed for them; no halfway business will do. Houses should face the south, with the beds down the center, an 18-inch walk each side, with three-foot wide benches on each side, made to hold six or eight inches of soil.

Some people try to grow Roses in houses heated with flues; that turned out a failure long ago. Some try to grow them in houses with a mixture of green plants; this may do to a certain extent if the house is heated with hot water, but it will not be a success.

The favorite Tea Roses now grown for winter are *Perle des Jardins* (yellow); *Niphetos* (white); *Catharine Mermet* (rose); *Bon Silene* (carmine); *Duke of Connaught* (crimson); and the latest introduction from England, the *William Francis Bennett*, a crimson-scarlet hybrid Tea Rose.

NEW ZEALAND FLAX.

One of the most beautiful ornamental-leaved tropical plants of our hot-houses, and used on lawns, is the *Phormium tenax*, var. *variegata*, or New Zealand Flax; it is rarely known to bloom in cultivation. A specimen, however, in the collection of a gentleman owning fine grounds at Llewellyn Park, Orange, N. J., has during the summer thrown up a number of flower spikes to the height of ten feet. The blossoms are orange color, and shaped something like the *Gladiolus*, hundreds of them being borne on one plant.

FUNERAL DESIGNS.

During the time when Garden Lilies were at the height of their beauty, superb funeral designs were made of these and white Sweet Pea blossoms. A very handsome and novel piece called the "Broken Link," has been

fashioned by a Broadway florist for a floral expression of sorrow. Three links of a chain, the center one being broken, are made, each of a different flower. These are placed on an easel of *Lycopodium*.

At the funeral of an infant, lately, the little casket, which was white, was surrounded by tall Daisy plants, the flowers of which rose in masses around the child, who seemed sleeping among them.

OUR WINDOW BOX.

Heliotropes should be established in pots before September.

Lift and pot *Libonias* and *Seriographis*, and otherwise treat like *Bouvardias*.

Don't wait till other folks have picked out and bought all the finest *Hyacinths*, *Tulips*, and *Narcissuses* before you get some. Pot some Dutch Bulbs now, and the remainder next month.

THE GOLDEN GEM FEVERFEW.

making prepared beds for them, but I consider this all unnecessary and labor in vain. I have seen quite as good Roses grown in a bed made of the natural soil, especially if the ground is rather stiff, which seems to suit them. The bed should be dug about 15 inches deep, with four or five inches of good, rotten cow dung turned in, and during their active season of growth they were mulched with three or four inches of the same material.

Roses, when grown under glass, are sometimes attacked with mildew. To prevent this the hot-water pipes should be painted with a mixture of sulphur and lime made of the consistency of whitewash; the lime is merely to make the sulphur stick. This will be required about every three weeks.

Watering is a matter of the first importance and requires some experience to know what is the proper condition. Whenever the soil shows indications of being dry on top, a thorough watering should be given—enough

Lawn and Landscape.

THE ASH-LEAVED MAPLE.

Negundo aceroides.

On the 4th of July, 1876, I planted an Ash Maple or Box Elder tree near the porch at the southeast angle of my house. It was a Centennial tree; and it has proven worthy to be one. When planted it was a mere switch, four feet high, and without a branch. To-day it is 20 feet high and has a top that casts a dense, grateful shade over the porch. I know of no tree that I can recommend more highly for door-yard shade than the Box Elder.

It can be grown successfully from Canada south to Tennessee and North Carolina, or even farther south. It grows rapidly, yet solidly, and so far as I know is altogether free from disease, and no tree is infested less with worms, etc. It has a dense, spreading top; in fact, it has this fault—a tendency to make too much top, so that the limbs are frequently broken in storms, if the trunk is not broken. This, however, can easily be remedied by keeping the top well trimmed out. This must be attended to during the first ten years of the life of the tree, else it will be at least unshapely, if it is not altogether ruined. Keep the lower branches at least eight feet from the ground, for the top will become so large and spreading that there will not be a good circulation of air under it if the top is nearer the ground. By keeping the top trimmed out the breaking of limbs will be avoided, as the wood is not easily broken; it is only on account of the great resistance which the top offers to the wind, on account of its density, and not because the wood lacks strength, that the top receives so much damage from storms. The leaves are not so large as of some trees, but they are of good size, and effectually intercept the rays of the sun, making a cool shade.

The tree is not injured by tramping, as are many trees used for shade. My Centennial tree is tramped about a great deal, being just by the pump and the steps leading upon the porch; yet it has always grown thriftily, and to-day its trunk is almost a foot in diameter at the base. This amount of tramping would prove fatal to the Oaks, Hickories, etc. While undoubtedly the Box Elder does better in some soils than in others, it has done well wherever I have planted it. My farm is not all prairie land, but runs into broken timbered land along a creek which flows through one side. But this tree has grown well upon the gravelly, sandy land that borders upon the creek as well as in the black, mucky soil of the prairie.

The Box Elder is a handsome tree. The top is spreading, symmetrical and graceful. The foliage is dark green. The trunk is smooth and well proportioned. In point of beauty it is excelled by none of our forest trees. It is equally commended by its hardiness. It does well in lower Canada; and along the fortieth parallel, where I have experimented with it, it is never injured by the winter. Last winter was an unusually severe one in this locality, proving fatal to large numbers of my orchard and ornamental trees, and injuring or killing outright

quite a number of the forest trees; but so far as I have been able to perceive, not one of my Box Elders has been injured in the least by the cold. Nor is it injured by heat or drought, and the thermometer hanging on the shady side of my Centennial tree marks 97°; yet the foliage on the tree is fresh and thrifty.

I have never had any Box Elder fail to grow after transplanting, but I have always transplanted small trees—those one year old. Nothing is gained by using older trees. The older the tree the greater the probability of its failing to grow; and ten years after transplanting, a tree one year old will be larger than one three years old when transplanted. This is true of all trees with which I have had experience. JOHN M. STAHL.

BEDS AND WALKS IN THE LAWN.

As a rule the lawn proper should not be cut up with flower-beds. Its broadest expanse appears to the best advantage when in a clean, velvety, unbroken turf. Crowding in flower-beds and shrubs at every possible point, destroys the main beauty of the lawn—in fact changes the space intended for a lawn into a shrubbery and flower-garden. Where the lawn is large, an occasional shrub kept neat and well-trimmed in harmony with the closely shaven turf, often adds much to its appearance, relieving the monotony of an extensive grass surface.

But to me a flower-bed out in the lawn proper, always seemed in bad taste. Shrubs and trees seem much more in place there. Trees and turf are naturally found together, the grass growing over the roots and about the stems of the trees; but bright, tropical flowers and variegated foliage of foreign origin are not natural there and can hardly be made to appear so. Such beds make dead blotches on the green surface of the lawn in early spring, and mar what would otherwise be a beautiful prospect. About the house, in the turnings of the walks and driveways, tastily arranged beds of suitable flowers are delightful. The flower-garden is an institution of itself as much as the vegetable-garden, and as a rule should be kept just as separate. It may form a beautiful feature of some part of the grounds, but should not be mingled with the lawn.

In laying out walks and driveways in a lawn beauty and utility must be jointly considered. A neat, well-made walk or driveway located to serve a useful purpose never mars a lawn, but rather makes the whole complete. However artistic a walk or driveway may be it detracts from the beauty of the lawn when placed where not needed. We often see superfluous walks laid out in this way, starting from no particular point and having no destination in view. After innumerable serpentine twistings and turnings, they usually come right back to where they started without having accomplished anything on the way more than to puzzle and annoy the traveler.

In the smallest grounds one often finds the greatest display of walks and driveways, the owners aiming to imitate the plans and arrangements of large parks that they have seen and admired elsewhere. The effect of such imitation is often ludicrous. For instance, where the house is only a few rods from the street, clumps of shrubbery are

planted in the line of the driveway, necessitating a turn and detour round the obstruction. While where a clump of trees of centuries' growth obstructed the direct passage-way in a large park, such a turn would appear graceful and natural, when one sits in a carriage and looks directly over the puny clump to the object of destination beyond the effect is simply ridiculous, showing, as it does, the transparent imitation.

Nor is it in good taste to take too round-about a course in laying a walk or driveway from one point to another. Dead, straight lines are not generally agreeable or natural, but the line of a driveway need be neither circuitous nor straight. A road or walk may lead to its destination with a gentle curve that will be agreeable to the eye, and at the same time not lead one a round-about chase. W. D. BOYNTON.

TRANSPLANTING EVERGREENS.

Although the safest season for transplanting evergreens of all kinds is spring, before growth has started, well-grown nursery trees may be transplanted in August and beginning of September with perfect safety. With proper care, in fact, they may be transplanted at almost any time. A neighbor of ours who has a choice collection of evergreens, moves his trees from one place to another, as seems more desirable, with utter disregard of seasons and weather, and never loses a tree.

With coniferous trees, more than with any others, it is of the utmost importance that the small fibrous roots should be preserved as much as possible in transplanting, and never be allowed to become dry and shriveled up. After the trees have been carefully planted, the ground around them should receive a heavy mulch which is to remain during winter; and in the case of tender kinds, a winter protection of evergreen branches or something equally effective, loosely tied around the trees, is to be highly recommended.

HARDY RHODODENDRONS.

The definition of the term hardiness in plants is frequently wrought with difficulties and uncertainties, but it will be safe to assert that any plant that has survived the last exceptionally severe winter may be termed hardy. In the vicinity of New York many varieties of Rhododendron that have withstood the cold of more than one decade have succumbed this year. Especially notable among the varieties that have come out of the trial unscathed are: *R. grandiflorum*, *Everestianum*, *giganteum*, *album elegans*, *Lee's purple*, *roseum elegans*, *atrosanguineum*, *gloriosum* and *purpureum elegans*.

INFLUENCE OF LANDSCAPE.

The influence of landscape upon happiness is far greater than is generally believed, says Ph. G. Hamerton. There is a nostalgia, which is not exactly a longing for one's birthplace, but a weary dissatisfaction with the nature that lies around us, and a hopeless desire for the unlure that we were born to enjoy.

FALL SEEDING.

When the ground is in good condition, early autumn is as favorable for sowing grass seed as any time. On poor, uncultivated land a perfect lawn cannot be established at any season, without previous preparation.

Flying flying—
 I watch the
 swallows flying,
 Flitting south before
 November spouts,
 Leaving the delay-
 ing leaves dying
 Broken-hearted for
 the buried rose.

Ellen Mackey Hutchinson

Follow, follow—
 Everything must follow—
 Even the memory of the summer days
 Follow, follow; good-by happy swallow
 Flying southward as the summer flies.

Exhibitions & Societies.

AMERICAN INSTITUTE FARMERS' CLUB.

The meetings of this club will be resumed on Tuesday, Sept. 22d. They are now held at Clinton Hall (Astor Place & 8th Street, near Broadway) the 2d and 4th Tuesday of each month, at 1.30 P. M. The discussions and exhibitions are always full of interest, and all persons interested in agriculture or horticulture are invited to attend.

MASSACHUSETTS HORTICULTURAL SOCIETY.

A special list of prices for Spring Flowering Bulbs has been issued in advance of the regular Schedule of Prices, in order that those desiring to compete may be enabled to make timely preparation. The date of the Spring Exhibition will be about the 20th of March, 1886. The prizes are very liberal and the list comprises Hyacinths, Tulips, Polyanthus, Nareissus, Jonquils, Lilies, Lilies of the Valley, Anemones, etc. Special prizes for fifty named Hyacinths are offered by the "General Union of Holland," to be competed for by nurserymen, seedsmen and florists; competition open to all. Schedules may be obtained from the Secretary, Rob. Manning, Horticultural Hall, Boston, Mass.

A GRAND POMOLOGICAL CONVENTION.

From all indications it appears that the coming meeting of the American Pomological Society, in Grand Rapids, Michigan, on September 9th and continuing for three days, will be the most numerous attended and most interesting assemblage for the discussion of fruits and their culture ever held on this continent, if not in the world. Many choice collections of fruit will be on exhibition, especially from the Central and Southern States; and much care has been taken to select topics for discussion which are suitable for a society covering such a vast extent of country.

Among the speakers and essayists announced are many of our most prominent and experienced fruit culturists, and never before have so many distinguished pomologists come together as are expected to meet on this occasion. In a letter just received from the venerable President, Colonel Marshall P. Wilder, he writes that his health is so far restored that he feels strong enough to undertake the long journey, and that he expects to be present at the meetings. This will be joyful news to his many friends and admirers.

The salutary influence which the American Pomological Society has exerted on the development and improvement of our pomological and horticultural interests in general, during the thirty-five years of its existence, can hardly be over-estimated. No other country nor profession has an association so thoroughly organized and admirably conducted for the promotion of the public good. If the society achieved nothing else but the publication of its Fruit Catalogue, from which may be seen at a glance the value and adaptation of every variety of fruit in each State, it would have accomplished a work of inestimable value, and yet this is only a small part of its work. The importance and usefulness of the society in uniting and bringing together all the most experienced

and progressive members of the profession, inducing the free interchange of opinion and experience, and promoting and establishing centralized action which shall at once command respect and authority, become evident to anyone who attends their meetings or who reads the society's reports.

The scope of the society being a national one, in the fullest sense of the word, unfettered by any trade interests whatever, it becomes the duty of every progressive American pomologist to add his share to the furtherance of its noble aims, and we cannot too earnestly urge those of our readers who can make it convenient to visit Grand Rapids at this time, to attend these meetings, and, if they choose to assist the common cause, to enroll their names upon the members' list. But whether members or not, all persons interested in fruit culture are welcome to take seats in the convention and take part in the discussions; and all kindred societies are invited to send delegates.

SOCIETY OF AMERICAN FLORISTS.

THE MEAT OF THE MEETING.

Special Correspondence of The American Garden.

This vigorous and full-grown daughter of the American Nurserymen's Association celebrated her first birthday by a grand meeting held in Cincinnati Aug. 12, 13, and 14. President John Thorpe said the florists' business has quadrupled every ten years and bids fair to reach enormous proportions. There are now in the United States 8000 florists, using over 3,200,000 feet or 630 acres of glass, an average of 400 square feet of glass to each florist. Allowing fifteen plants per square foot, would give nearly 50,000,000 plants as the annual product of these greenhouses. In four months of last winter more than 4,000,000 Roses were sent to New York alone. He estimated that there were at least 24,000,000 Roses produced in the winter of '84-'85. Twelve thousand acres were used last year for growing bulbs in this country and we imported the product of at least 6000 acres of European growth. The object of this society is to gain information, get acquainted with each other, discuss questions of mutual interest, and promote the floricultural education of the people.

The florist must be a person of a mechanical turn of mind, intelligent, observing, and above all, a reader of everything pertaining to his business. Catalogues have ceased to be mere price lists, many of them are valuable works of art, awakening interest in flowers in thousands of homes to which they find their way. The field of the society's work is almost unlimited. Thousands of gentleman's gardeners should be reached by this association, and tens of thousands of amateurs should be influenced for good by its deliberations.

DISEASES OF PLANTS AND THEIR REMEDIES Was the title of a paper by Charles Henderson of New York. Very few vigorous plants are troubled by insects. The Coleus in the greenhouse during winter is the prey of the mealy bug. Oak doors, in conditions more congenial, the Coleus rapidly frees itself from the incubus. A lowering of vitality by the partial freezing of a Rose-house leads to mildew of such plants as the frost affected. Carnation disease is caused by working the plants at a high and unnatural temperature.

Mr. H. propagates them very early in spring and pricks into boxes, and keeps them at a low temperature. Verbenas are weakened by allowing them to become pot-bound before planting out. He plants only the last strikings for stock plants, putting them in open ground before they need repotting; gives them good soil, cuts back close in August; surface manures, and propagates from the rank, new growth in October. The rust on Heliotropes and Bouvardia is the same thing, the result of weakened constitution. Celery rust is induced by injury to the roots.

The green fly he keeps at bay by the vapor of moistened Tobacco stems. A strip two feet wide and ten inches deep, laid under one of the benches the length of the house, kept moist and renewed once in six weeks, protects the plants perfectly. He used the new remedy, Fir tree oil, for mealy bug, dipping the plants into it.

The Rose-bug larva is a terrible pest. The white grubs, about a third of an inch long, prey upon the roots, doing great damage. The only remedy is to hand-pick the mature bugs.

Black ants work great injury by carrying up the soil and plastering it around mealy bugs and aphids. Pyrethrum and a bellows is the remedy.

For mildew and red spider he sprinkles the heating pipes with water and dusts on flower of sulphur. Black mildew he thinks is a result of impoverished soil, as it never appears when liberal manuring is practiced.

In the discussion which followed, Mr. Armstrong of St. Louis said that he coats the pipes with a mortar of lime and sulphur. Mr. Bonsall of Salem, O., thought the coating of linseed oil and sulphur was very offensive, and he hardly knew which was the most objectionable, the red spider or the bad smell. Mr. Reddymeyer keeps his stock Roses separate and cool. Chas. Henderson, James Hendricks of Albany, N. Y., and J. Thorpe used sulphide of potassium for Rose-mildew in solution of a quarter of an ounce to one gallon of water.

C. L. Allen, Garden City, N. Y., said that it is customary to abuse and misuse the weak. This is the case with that small but beautiful insect, the red spider. Like other spiders it is carnivorous, and never ate a plant in its life. Microscopic insects come to live upon the plants and the red spider to live upon them. It is a friend, not a foe. A healthy condition of plants, brought about by proper temperature, care in watering and ventilation, helps the plant to repel the microscopic parasite and leaves nothing for the red spider to live upon. To keep out-door plants healthy, nothing is used but rich soil frequently stirred and kept free of weeds.

1st Vice-Pres. J. K. Jordan of St. Louis had noticed that florists just commencing in business are not troubled with insects for a year or two. Their houses are new and the earth around them clear of disease or larvae, and as long as this state continued they are comparatively exempt. He would build greenhouses with movable roof, and remove the sashes entirely during summer. Robt. Halliday of Baltimore spoke on Disadvantages of Cultivating and Advertising many varieties of the same species.

He advised to cut down the Rose list to one-tenth or more, while Dahlias, Camellias, Azalias and many other classes of plants

could be reduced one-half. It was moved and voted that a committee be appointed to reduce the number of varieties and also to revise the flower and seed nomenclature.

THE CONSTITUTION.

The president offered an excellent draft of a constitution, which after having been amended and revised by a committee was adopted. An amusing discussion occurred upon who should be eligible. Some members were afraid that the doors would be opened too wide, but finally the remark of Mr. Vaughn that he had not learned that any \$2 had been refused, brought the objectors to a more practical view, and the matter was left as the committee worded it, which makes any Florist, Seedsman, Gardener, Superintendent of Parks, Dealer in Florists' Supplies or Amateurs eligible to membership. The officers are a President, First Vice-President, Treasurer, Secretary, an Executive Committee of nine and an additional Vice-President for each State, States having more than forty members being entitled to two. New York, Pennsylvania, Ohio and Illinois are thus favored.

FLORAL EMBELLISHMENT OF PARKS AND GARDENS.

H. De Vry, Supt. of Lincoln Park, Chicago, was announced to read a paper on this subject on Wednesday evening, but failing to appear, Wm. Hamilton, Supt. of City Parks, Allegheny City, Pa., gave a few general principles. Public grounds are for comfort, convenience and education. Shade and cleanliness make them comfortable. Walks must be very broad or only slightly curved to promote dispatch and convenience, and planting must be so arranged as to give the public a taste of and love for the beautiful. He would plant on the same principle that one would employ a school-teacher or buy school books; get the best. The best seeds and plants cost but little more than the poor. Of the wild garden and the carpet style he would give the best specimens of both. There are places where one style could not be used to the exclusion of the other. Lastly, try and do a little better each year.

C. L. Allen believed in object lessons every time. Did not believe in books, and he would teach landscape gardening by sending the student to nature and have him practice what he found there. Study things, not books. The conflict between men and books is unequal. Men instead of absorbing the books, become generally absorbed by them. Mr. Thorpe said that Mr. Allen does not seem to practice what he preaches, for he has a fine library and reads the books.

J. D. Carmody, Evansville, Ind., said books hold the combined knowledge of the world, and we should go slow in condemning them. To do away with books would be to retrograde many centuries.

THE CUT FLOWER TRADE.

Wm. J. Stewart of Boston in his paper said that Boston was the pioneer in the cut flower trade. He well remembers when New York depended upon Boston for Rose-buds, and how convenient it was for the Boston florists to ship to New York their surplus that had been handled over the counter all day. But unfortunately this trade was a thing of the past, for now New Yorkers not only raised their own Roses but shipped their surpluses all over the country.

The immense demand for cut flowers necessitated the creation of the flower commission merchant, who purchases the products of hundreds of gardeners and distributes them among his customers who look to him for a regular supply. Much of the commission man's time is employed in explaining to growers why the price for flowers is so low, and to make clear to the buyer why flowers are so costly. The variations in the demand for flowers caused by holidays and grand fetes, etc., has been equalized by improved methods of keeping flowers, enabling dealers to bridge over periods of several days. Darkness, ice, and exclusion of air are important factors for keeping flowers. Rose-buds, Tuberoses, and Carnations are always in demand on account of their excellent keeping qualities. The trade in New York alone amounts to over \$1,000,000 annually.

As with other products of the soil, it will be discovered, sooner or later, that some localities favored by cheap coal, abundance of sunlight, purity of atmosphere, and other advantages, are superior to others for raising flowers. These places will become large producing and shipping centers; refrigerator cars will carry the flowers to distributing points, and express messengers will be taught new ideas of transportation.

[The remainder of the meeting was occupied with a most interesting discussion on Roses, Summer Cut Flowers, Heating, etc., etc., a full report of which will be continued in our next issue.]

L. B. PIERCE.

Miscellaneous.

POISONS DESTRUCTIVE TO INSECTS.

One of the oldest insect destroyers is "Flystone and Treacle." What is that? Flystone is Cobalt, a metal of rarity produced chiefly in the mining of arsenic and manganese and used in making blue pigment. The raw product is of a brownish color, and when mixed with sweetened water and placed in a vessel for flies to drink, destroys them by wholesale. When a sponge is wet with the same mixture or Flystone and beef tea it will catch ants; the fluid is death to fowls and small animals, too.

"Devil's Sugar," or Sugar of Lead mixed in water, was used as a wash for lice on plants, and was long held as the sovereign remedy for bedbugs. Metallic Mercury mixed with white of eggs and applied with a feather in cracks and crevices was a famous remedy, but that is superseded in latter days by the soluble products of the latter metal, Corrosive Sublimate, mixed with alcohol or water and sal ammoniac.

Chromic Acid, which in strong solution will dissolve a mouse, is as a destroyer of organic life, animal or vegetable, very potent. Coal tar and its products, Creosote, or Carbolic Acid of various strengths overpowers all other ordinary smells and eradicates them by prevention of putrefaction. Coal oil and oil of wood tar destroys both animal and vegetable life.

Red Bichromate of Potash and Paris Green, two corrosive poisons destroying the membrane of all flesh, inflicting upon man irritating sores, acting with deadly effect upon

small animal and insect life, and alike scorching to vegetation, are more or less soluble in water, the first to the greater degree. Paris Green is about one-fifth Arsenious Acid, the rest Blue Vitriol and Pearl ash with a little Acetic Acid thrown in it to make it bright. Red Chromate of Potash is a combination of Chrome, Iron, Potash and Sulphuric Acid.

Sulphur, by its odor or mechanical contact, proves certain death to some insects. In a conservatory sulphur smoke acts with similar effect upon parasites, as it does upon bees in a hive.

Borax is distasteful and annoying to ants and roaches but of little avail in the garden. Salt to slimy worms or snails is a terrible dressing. Saltpetre water will make plants grow and kill grubs.

Nicotine, the death dealing principle in Tobacco, will kill an elephant or a cat, say nothing of a worm or flying midget whose substance is but the fraction of a pennyweight. Tobacco-tea obtained by steeping stems in tepid water for a day and then straining the liquor concentrated by slow evaporation, is effectively destructive of hosts of minute winged and creeping things. Snuff is not certain.

"Insect Powder," *Pyrethrum roseum* and *P. carneum*, grows away up among the mountains of Armenia just below where Noah's ark is said to have rested. This is the "Persian Powder." Another variety is the "Dalmatian," or *Pyrethrum cinerariaefolium*, which came from eastern Europe. Each when fresh or well kept from air will kill parasites on man or beast, or in clothing; made into tincture it is a great aid in window gardeniug. The new California Powder is equally effective. These powders first stifle and then kill the insects. Burned on a tin plate or shovel they will kill mosquitoes.

Hellebore when fresh is far more powerful than when two years old; when three and four years old it is like old Sage for sausage-meat—of small account.

Stavesacre seed tea is death-dealing to lice on plants, vines and cattle, but the decoction is also certain death if it is drunk.

Cayenne Pepper or Capsicum is very hard on Caterpillars and other soft insects, but this like other vegetable powders is worth most when fresh and oily, for all vegetable insecticides appear to lose their effectiveness by age.

Grubs that work under ground are the most difficult to destroy, for Mother Earth is an absorbent of all noxious substances, nevertheless, the day of doom is coming. Bisulphide of Carbon,—a volatile, odorous liquid which will cause a headache to be remembered,—either alone or mixed with a Potash base, will kill grubs and cut-worms and the phyloxera as well.

From the above it will be seen that remedies are abundant, and fortunately scarcely any which act with destructiveness upon the lower forms of animal life will prove equally so to vegetation. True as it is that we may kill nine worms and the tenth takes the plant, yet with care and judgment that comes with experience, nearly all the products of the greenhouse, the garden, or the farm can be saved from their insect enemies. For when man was sent to till the soil, power and dominion over all was given him.

BENJAMIN HAMMOND.

WOMEN WORKERS

IN THE GARDEN AND FIELD.

Martha Hamilton, Birmingham, Penn., is credited with the successful supervision of 60,000 silk worms.

German women say they like to work out doors part of the day rather than to be employed every day in the house, and the men folks help about the cooking.

Mrs. Waleott of Massachusetts, says that the out-door work of a farmer is not so hard as that of the kitchen, and that many women in Kentucky are doing farm work rather than busy themselves in kitchens.

Miss Kreamer, of Helena, Ark., has planted 22 acres in corn and 7 acres in cotton, having done the plowing herself and attended to the crop so far without help, and expects to harvest a bale of cotton and forty bushels of corn to the acre.

Gardening is peculiarly woman's outside sphere; she takes a pleasure in it; it does her good—mind and body. It is not labor, but exercise. It has an elevating influence upon herself and family, and, too, upon the neighborhood. It induces in the community that noble contention, or rather emulation, of who can grow the most and prettiest flowers, and who can have the sweetest and most cheerful homes.—*Rural New-Yorker*.

Mrs. Julia B. Nelson, widow, formerly a teacher in the South, a noted temperance worker and a woman suffragist, was left by a husband a 240-acre farm in Minnesota, which she cultivates successfully by the aid of three intelligent colored youths, former pupils of hers in the South. She is a good judge of horses, and selects with care the varieties of seed she plants. No barley is planted on her farm, because she knows the chief demand is from brewers.

It is said of a Boston woman in the South, the daughter of a once wealthy man, that being reduced to the necessity of providing for her own wants, she resolved to manufacture pickles and preserves for the market. She told her friends, and they promised to be customers. She found no difficulty in selling all that she could make with her own hands. The next year she enlarged the business, and the third year she expanded it still further, her condiments having by this time acquired a reputation in the market. Now she is making a net profit of about \$10,000 a year.

The German, Flemish, and Dutch women who help husband or father in his fields are strong, hardy women who rear a stalwart race. Half the fine ladies who now find a few turns on a piazza almost too much for them, would be all the better for a graduated scale of garden work. Beginning with a quarter of an hour a day, they would find at the close of a month that they could easily do their two hours, and that they ate and slept as they never had done before, while they forgot that such evils as blue devils and nerves had any existence.—*From an English Parliamentary Reporter*.

ANSWERS TO CORRESPONDENTS.

Failure with Lilies.—*M. C. C., Baltimore, Md.*—The *Lilium auratum* mentioned in our July number is still in glorious bloom, some of the stalks bearing a dozen magnificent flowers. There are no flowers that we are more anxious for that our readers should succeed with than Lilies, and yet without a complete knowledge of all the existing conditions it is impossible to tell why Lilies fail. There is always less certainty when planting in spring than in fall, as bulbs obtained in spring have generally been dug the previous fall, and been kept out of the soil all winter. The sooner Lilies are replanted after having been taken up the better, and for this reason fall planting is usually more successful; with *L. candidum* it is a necessity, as this species makes its leaf growth during autumn. Paris Green will not help the bulbs in the least, but may injure them seriously. If your soil is too heavy or wet, make raised beds, plant deep—except *L. candidum*—place sand around the bulbs, and mulch in winter.

Some Floral Topics.—*W. A. C., Charleston, S. C.*—The best season for pruning Azaleas is just after blooming, yet it may also be done after the plant has made its season's growth. The same applies to the roots.

Primroses of last year may be readily propagated by division, and, if properly cared for, will bloom the following winter. The way usually practiced by florists is to pack moss around and between the shoots. This induces root-growth of each branch, and insures the growth of the separate divisions after being pulled apart.

Violets may be forced into bloom at any time in winter, if the plants are healthy and vigorous.

The three best Roses for winter forcing can hardly be named unqualifiedly, but the following are as good as any: Catharine Mermet, rose; Perle des Jardins, yellow; Niphetos, white.

Restoring Dry Bulbs.—*T. O. P., Laprairie, Can.*—The best way to restore dry bulbs is to pack them in damp—not wet—Sphagnum Moss until they show signs of growth, when they may be planted in soil. If the moss is kept too wet, the bulbs will invariably rot.

Plants for Name.—*Carrizo, Texas.*—It is rarely possible to name a plant from a single leaf, although it may be easier to say what it is not. The leaf named "Orchid" is not that of an Orchid nor of anything allied to it. The plant "started from wild garden seeds" is *Centranthus macrocephalus*, Red Valerian, but it is not always red. "Reseda," so far as can be determined from the specimen, is probably correct, a species of Mignonette. *Zauschneria Californica* is a very pretty plant; we cannot find it in any of the seed catalogues at hand.

Best Time for Planting Raspberries.—*"Rubus," New York.*—Either in the fall after the leaves have fallen, at any time in October or November, or in spring as early as the ground becomes fit to work. On dry soil, autumn planting is to be preferred.

Seeding Lawns.—*B. M., Philadelphia, Pa.*—The earlier in autumn grass seed is sown the better. If the ground is in good condition the month of August is an excellent season for seeding a lawn.

OUR BOOK TABLE.

The American Fruit Culturist, by John J. Thomas. Wm. Wood & Co., New York, Publishers. Price \$2.00. More than thirty years ago the author published the first edition of his "Fruit Culturist," then the only existing complete and reliable work on American Fruit Culture. It was subsequently much enlarged through several revised editions until in its new edition, just issued, it is brought down to the methods and varieties of fruits of the present date. Several other excellent works on fruit culture have appeared within these three decades, but none of them are so admirably and conveniently arranged for the use of the busy man, as well as for the beginner in fruit culture, nor do any give so great an amount of practical, reliable information, elucidated by hundreds of accurate, plain illustrations in so small a compass. The first part of the work treats of the general principles and practice of fruit growing, the second of the different kinds and varieties of fruits, containing also a convenient monthly calendar of work in the nursery, orchard, and fruit garden, also a glossary of pomological terms, and other useful information. The fruit grower who does not avail himself of the aid that a book like

this affords, deprives himself of one of the most essential means to success.

Free Niagara, Nature's Grandest Wonder. New York's Imperial Gift to Mankind. Published by Matthews, Northrup & Co., Buffalo, N. Y. Price 30 cts. A highly artistic and tastefully gotten up pamphlet giving the history and completion of the movement to complete the Free Niagara Park. Many artistic illustrations embellish the work, and its typographical features are of a high order.

TRADE NOTES.

ITEMS OF GENERAL INTEREST FROM THE SEED, NURSERY AND FLOWER TRADE ARE SOLICITED.

Dr. T. H. Hoskins of Newport is a lucky nurseryman. He writes us that for years he has been unable to supply the orders received. The good doctor is very conscientious, and we believe could not bring himself to send out poor stock. So his reward is great, in a good trade, and the knowledge of well doing. May his kind multiply.

A. Bruckenridge of Govanstown, Md., writes that his advertisement of Orchids in THE AMERICAN GARDEN has paid him well, and that he proposes to have a large sale in Boston about September 15, at which all his best Orchids will be offered.

The fall trade in bulbs promises to be largely confined to a few houses, many dealers having withdrawn from the trade on account of the risk of loss and the competition which has cut down prices to a comparatively low basis. Yet the interest in bulb culture seems to be on the increase.

Horticulturists say that fall settling of pot-layered Strawberries is on the increase, but one of the largest dealers tells us that the trade in potted plants is very unsatisfactory and that there is "very little money in it," and that the demand is comparatively small. If this is generally true where does the "increase" come in?

Mr. B. K. Bliss, who has been spending some months in France at the home of his daughter, and visiting the European seedsmen, has returned to this country much improved in health and spirits.

Mr. D. S. Marvin of Watertown, N. Y., has been "enjoying poor health" of late, but now, we are glad to learn that he is recovering and getting back some of the enthusiasm which has prompted him to produce some remarkably fine varieties of fruits. Mr. Marvin deserves well of the fruit-growing public.

The nurserymen and fruit growers along the Hudson River have suffered severely from drouth and bad weather this year, and nothing but patience and pluck will pull them through. But most of them possess these characteristics to a marked degree and we expect to see them all right again before long.

It seems to be a well-settled fact, though many people don't yet accept it, that the days of great profits in the seed trade are ended. Those houses which make money nowadays, are those which take extraordinary care in the purchase and selection of stocks, and sell only seeds of prime quality, true to name. Though now and then some party will make a large profit on poor seeds, or a reintroduced old variety under a new name, yet his success is sure to be temporary and he has no cause to wonder if his trade quickly falls off in volume in subsequent years.

GOOD WATER.

The Waukesha Glenn water advertised in this issue is one of the very finest of all table waters, and is fast becoming known as a specific for many diseases of the stomach and bowels. It seems like "carrying coals to Newcastle" to bring spring water from the West to the East, but the Waukesha Glenn is gaining many converts to its virtues in all sections.

THE FLORAL WORLD.

This superb, illustrated magazine is now recognized as the best Floral Monthly published in America. It specializes the curiosities and beauties of the Vegetable Kingdom. Correspondence from all parts of the world. Specimen copy and packet Floral Mixed Pansy seed mailed on receipt of three 2-cent stamps. Address Floral World, Highland Park, Chicago, Ill. THE AMERICAN GARDEN and the Floral World one year for \$1.25.—*Adv.*

IF YOU WANT A GOOD Breech-Loading Single-Barrel **SHOT GUN**

BUY ONE OF STEVENS'

"With one of Stevens' Single-Barrel Shot-Guns we skunked the crowd."
"HOGE & CO., Wheeling, W. Va."

THE ABOVE CUT REPRESENTS STEVENS'

NEW STYLE SINGLE BREECH-LOADER!
WHICH IS CLAIMED BY EXPERTS TO BE THE

BEST IN THE MARKET!
The only objection to them is that they shoot so well, are so handy to take apart and carry about in a trunk or a bag, that everybody wants them, and the makers have had to enlarge the factory and work nights to supply the increasing demand. With one of these guns it will not be necessary to take a back seat in any competition.

- GALLERY PISTOLS.—Light, \$20.00. Heavy, \$22.00.

SHOOTING GALLERY, 173 South Clark Street,
CHICAGO, Sept. 25, 1883.

DEAR SIR:—In my gallery I have used a twenty-dollar Stevens Rifle every week day for eight years. It was shot over five hundred thousand times, and during the whole eight years the cost of repairs did not exceed one dollar. It was then in good order, and I sold it for only two dollars less than it cost me, in order to replace it with a Stevens twenty-five dollar No. 5 rifle, which has the Improved Vernier and Globe Sights. With this No. 5 rifle one of my customers, a few days since, rang the bell eighteen times in twenty shots through a three-quarter inch bull's eye, at sixty feet off-hand.

I give the Stevens rifle preference over all others for accuracy, durability, and convenience of operating. **R. B. FULLER.**

THE AMERICAN GARDEN.

Established 1872. Edited by F. M. Hexamer.

An illustrated monthly magazine of Horticulture for Fruit Growers, Florists, Nurserymen, Gardeners, Gentlemen Farmers, Ladies, Amateurs: for everybody who loves nature, owns a plant or rod of land.

It is a real treasure. It stands in the front rank and merits success.—*Marshall P. Wilder.*

Its teachings are sound and practical.—*Am. Agriculturist.*

Eminently practical, trustworthy and enjoyable.—*New York Tribune.*

Very useful.—*Gardener's Monthly.*

Invaluable for every garden.—*Farmers' Review.*

It is so good it can't come too often.—*N. E. Homestead.*

No one who cultivates a garden can afford to be without it.—*President Petter, Bedford Farmers' Club.*

Should be found in every rural home.—*Prof. W. R. Lazenby.*

Contains just what the people want, served in the most palatable style.—*P. T. Quinn.*

CONTRIBUTORS:—Peter Henderson, E. P. Roe, P. T. Quinn, Chas. A. Green, P. M. Angur, Profs. Beal, Budd, Halsted, Bailey, Peter B. Mead, Chas. B. Shinn, Dr. T. H. Hoskins, Wm. Falconer, W. C. Barry, P. Books on Gardening.

Choice Special Periodicals.

A Few Choice Implements.

OUR PREMIUM COMBINATIONS.

We have taken special pains in the selection of the following books and periodicals, etc., and, so far as we know, there has never been a more attractive series of combinations offered to people interested in Horticulture.

The form and method of the offers is, we think, ENTIRELY NEW. (a.) We quote a price for THE AMERICAN GARDEN together with the article mentioned, and (b.) we also offer each article as a premium for a club of subscriptions.

Please send orders for the following to our Greenfield Office.

It will be seen that the prices first named are in most cases the usual price of the premium alone.

(a.) (b.) WHO CAN GET THE PREMIUMS?—The offers (a) at the head of the paragraphs are for either old or new subscribers. The offers (b) at the foot of the paragraphs for one "new" subscription are only to those who are themselves subscribers; the clubs of two or more may include the sender's name.

1.—(a.) For \$5.00, *The American Garden 2 years (or 2 subscriptions) and*

Downing's Fruits and Trees of America; Or, the Culture, Propagation and Management in the Garden and Orchard of Fruit Trees generally. With descriptions of all the finest varieties of Fruits, native and foreign, cultivated in this country. By A. J. Downing. Second revision and correction, with large additions. By Charles Downing. Over 1100 pages, with several hundred outline engravings, with latest Supplements. It contains the names and synonyms of over 10,000 varieties. 8vo cloth. (Price \$5.00.)

"As a work of reference it has no equal in this country, and deserves a place in the library of every pomologist in America."—*Marshall P. Wilder.*

(b.) Given as a premium for 10 subscriptions to *The American Garden* at \$1.00. Add 25 cts. for postage.

2.—(a.) For \$2.00, *The American Garden 1 year, and*

Downing's Selected Fruits. From Downing's Fruits and Fruit Trees of America. With some new varieties, including their Culture, Propagation and Management in the Garden and Orchard, with a guide to the selection of Fruits, with reference to the Time of Ripening. By Charles Downing. Illustrated with upwards of 400 outlines of Apples, Cherries, Grapes, Plums, Pears, &c. None but Choice and Test Fruit are named, and with synonyms amount to over 2,500 varieties. 12mo cloth. (Price \$1.50.)

(b.) Given as a premium, sent prepaid, for 3 subscriptions at \$1.00 each.

3.—(a.) For \$5.00, *The American Garden 2 years (or 2 subscriptions), and*

The Illustrated Dictionary of Gardening. Vol. 1. (Price \$5.00.) A Practical Encyclopedia of Horticulture, for Gardeners and Botanists. By G. Nelson and able assistants. To be completed in three volumes. A Unique and Exhaustive Work, in which the practical information and Botanical beauty of its illustrations are without a parallel in any book on Gardening. Over 2,000 first-class Engravings will be given in the complete work. Vol. 1, A to E, now ready. Cloth, 4to. 520 pages.

(b.) Given as premium, one volume, for 10 subscriptions to *The American Garden* at \$1.00 each. Add 25 cts. for postage.

4.—(a.) For \$3.00, *The American Garden 1 year, and*

Barry's Fruit Garden. A standard work on Fruits and Fruit Trees; the author having had over 30 years' practical experience at the head of one of the largest nurseries in this country. New Edition, revised up to date—Invaluable to all Fruit growers. By P. BARRY. Illustrated. Cloth, 12mo. (Price \$2.50.)

(b.) Given as a premium for 5 subscriptions to *The American Garden* at \$1.00 each. Add 15 cts. for postage.

5.—(a.) For \$2.00, *The American Garden 1 year, and*

Thomas' American Fruit Culturist. (Price \$2.00.) New, Revised Edition, with practical directions for the Propagation and Culture of all Fruits adapted to the United States. By John J. Thomas. Illustrated with 519 Fine Wood Engravings. In one handsome 12mo volume of 593 pages, bound in extra Muslin. In the present (nineteenth) edition, a general revision of the work is made throughout, and among the added portions are descriptions of the newer Strawberries, Raspberries, Peaches and Grapes; lists of some of these fruits once famous, but now passing out of cultivation; directions for pruning orchards; construction of fruit houses and the best modes for storing fruits; new illustrations of budding and grafting; management of Orange groves in Florida; and a thorough revision of the Descriptive List and Index by the addition of all noted new sorts.

(b.) Given as a premium for 3 subscriptions to *The American Garden* at \$1.00 each. Add 15 cts. for postage.

6.—(a.) For \$2.50 *The American Garden 1 year, and*

Long's Ornamental Gardening for Americans. A Treatise on Beautifying Homes, Rural Districts and Cemeteries. A plain and practical work at a moderate price, with numerous illustrations, and instructions so plain that they may be readily followed. By Elias A. Long, Landscape Architect. Illustrated, Cloth, 12mo. (Price \$2.00.)

(b.) Given as a premium for 4 subscriptions to *The American Garden* at \$1.00 each. Add 15 cts. for postage.

7.—(a.) For \$6.00, *The American Garden 3 years (or 3 subscriptions), and*

One Year's Sketch Book. By Irene E. Jerome. See specimen illustration on page 217 of this issue. An original series of illustrations, from nature, comprising forty-six full-page pictures (9½ x 14 inches) of great power and beauty, engraved in the best manner and at a great expense. The illustrations are full of life and color. Natural beauties are taken from all the year around. Scenes of Spring, Summer, Autumn, and Winter, in landscape and water sketches, by flashes of sunlight and straggling moonbeams, in every variety of shape, shade and color, mingle with gems of poetry applicable to the season. The volume is elegantly bound in black and gold. (Price \$6.00.)

(b.) Given as a premium for 10 subscriptions at \$1.00 each. Sent by express.

8.—(a.) For \$15.00, *The American Garden 5 years (or 5 subscriptions), and*

Orchids, The Royal Family of Plants. (Price \$15.00.) With illustrations by Harriet Stewart Almer, comprising twenty-four magnificent specimens in colors, each 10 x 14 inches, reproductions of some of the most celebrated and costly varieties of this peculiar branch of the floral kingdom. The collections from which these illustrations have been made are among the best in this country. The volume is 14 inches in length, 11 inches wide, 1½ inches in thickness; gilt edges, beveled boards, and richly adorned in black and gold, making a beautiful book. Cloth, full gilt.

(b.) Given as a premium for 20 subscriptions at \$1.00 each. Sent by express.

9.—(a.) For \$2.00, *The American Garden 1 year, and*

Mushrooms of America, Edible and Poisonous. (Price \$2.00.) Carefully colored lithograph plates, showing 28 species of Edible and Poisonous Mushrooms, with full descriptions, and best manners of cooking the edible sorts in brief, concise form. By Julius A. Palmer, Jr., who for ten years has carefully studied Mushrooms with a view to their edible qualities. Published by L. Prang & Co., in the perfect manner this house is noted for. By its use one can readily learn to detect poisonous or edible Mushrooms. In the form of two charts, on heavy paper, for hanging on the wall; or the same in 12 colored plates and 4 plates of text, in strong portfolios.

(b.) Given for 3 subscriptions at \$1.00 each. Add 12 cts. for postage.

10.—(a.) For \$1.35, *The American Garden* 1 year, and Webster's Practical Dictionary. (Price \$1.00.) A new departure in dictionaries. Undoubtedly the best cheap dictionary ever published. See special advertisement of this offer on page 111 of cover.
(b.) Given as premium for 1 new subscription at \$1.00. Add 10 cts. for postage.

SPECIAL CLUBBING COMBINATIONS WITH LEADING PERIODICALS.

11.—(a.) For \$1.25, *The American Garden* 1 year, and Good Cheer, the phenomenally successful literary paper for the family. It is bright, pure, lively, and sparkling with choice stories, poems, anecdotes, biography, and useful information. Full of good sense, good morals, good fun, good literature and good cheer. (Price 50 cts.)
(b.) Given as premium for 1 new subscription to *The American Garden* at \$1.00.

12.—(a.) For \$1.25, *The American Garden* 1 year, and Our Country Home, a monthly journal of agriculture and country life. Acknowledged to be one of the best, most reliable, best edited and brightest papers of its class. Edited by E. H. Libby, F. D. Curtis, E. S. Goff, F. D. Coburn, L. K. Feleh, E. B. Rexford, and Mrs. Mary C. Hungerford. Full departments on the Field, Garden, Dairy and Stock, Poultry, Swine, Law, and Home affairs. (Price 50 cts.)
(b.) Given as premium for 1 new subscription to *The American Garden* at \$1.00.

13.—(a.) For \$2.75, *The American Garden* 1 year, and Good Housekeeping (1 year). (Price \$2.50.) A semi-monthly journal "Conducted in the interest of the Higher Life of the Household." Conceived in a spirit of real love for the promotion of "the homes of the world," and executed by some of the wisest and brightest of practical men and women who have ever worked for this good cause. Good Housekeeping merits the warm reception and great success it is meeting with. Illustrated, and beautifully printed on fine paper. (Price \$2.50.)
(b.) Given as premium for 5 subscriptions to *The American Garden* at \$1.00 each.

14.—(a.) For \$1.20, *The American Garden* 1 year, and Green's Fruit Grower (1 year), a quarterly journal of fruit culture. Bright, reliable, full of solid information and good sense, written in a style that it is a real delight to read; and the book, *How to Propagate and Grow Fruit*, by Chas. A. Green, well written and thoroughly reliable, covering all phases of the subject. (Price of paper and book 50 cts. each.)
(b.) Given as premium for 1 new subscription to *The American Garden* at \$1.00.

A FEW CHOICE IMPLEMENTS.

15.—(a.) For \$3.00, *The American Garden* 1 year, and Little Detective Postal Scale. (Price \$3.00.) Weighs 14 oz. to 25 lbs. Hundreds of thousands sold. The best of all low-price scales; equal in value to any \$5 or \$10 scale we have seen. For House or Office it is equally efficient. One side of the beam shows the cost of postage in cents of any article weighed. Specially fine for seedsmen and nurserymen. Sent by express.
(b.) Given as premium for 5 subscriptions to *The American Garden* at \$1.00 each.

16.—(a.) For \$18.00, *The American Garden* 5 years, and Stevens' Hunter's Pet Rifle. (Price \$18.00.) Weight about 5 1/4 lbs.; length of barrel, 18 inches, good for 40 rods; 22 rim, 32, 38 or 44 calibre; rim or central fire; with combined sights. That it is made by J. Stevens & Co. is proof of its quality. A specialty, first made for a geological surveying party going to the Rocky Mountains, who wanted a gun to knock over a bear, which would be as light and portable as possible. Each gun thoroughly tested and remarkably accurate. With it you can knock over a woodchuck or animal of similar size, 50 rods away, with great certainty, and some state that they do even better work at a quarter of a mile away. All of the "STEVENSONS" arms are made for every day folks, and at a price within the reach of all; require no fixings and no previous knowledge of arms; no special cartridges.

The publisher of this journal has always loved a gun and began to shoot at 10 years of age, though hard work and the business of life has kept him from this pleasure in late years. But he thinks that boys should be early taught the proper use of guns, and that only good guns should be put into the boy's hands. That is one motive for making this offer, and for selecting so good and low-priced a weapon as the "Stevens' Hunter's Pet."

(b.) The 18-inch "Pet" given as a premium for 30 subscriptions at \$1.00 each.

17.—(a.) For \$12.50, *The American Garden* 4 years, and Stevens' Single Barrel Breech-Loading Shot-Gun. (Price \$12.50.) With forehand stock and Stevens' patent bolt; 12, 14 or 16 gauge; weight 6 to 7 lbs.; length of barrel 28 to 32 in.

575 GREENWICH ST., N. Y.

My Single Barrel needs a new catch. I had it this summer down in Virginia, and used it in preference to my double gun, and I don't want anything better as to shooting qualities. It has been shot in the past two years over 2000 times, and has required no repairs since I bought it.

ROBT. GORDON.

(b.) Given as premium for 20 subscriptions to *The American Garden* at \$1.00 each.

FRUIT EVAPORATION.

The preservation by drying of the surplus fruit that before was wasted, and of whole crops because of low prices, has developed in a few years to great proportions and given rise to the special manufacture of apparatus for drying the fruit. We give herewith an illustration of the Evaporator made by the American Manufacturing Co. of Waynesboro, Pa., which has an excellent reputation among fruit growers for efficiency. Parties who have used it report the successful drying of Peaches, Pears, Apples, Plums, Raspberries, Blackberries, Strawberries, Huckleberries, Sweet Corn, Tomatoes, Pumpkins, Egg Plant, Sweet Potatoes, Lima Beans, Peas, etc., which are of firm quality and sell at highly profitable prices, even when the market was overstocked with fresh fruit. The bountiful returns in good money through this avenue for fruits that probably would be wasted, may be the means of making many a farm profitable that now barely pays expenses.

Parties who have used it report the successful drying of Peaches, Pears, Apples, Plums, Raspberries, Blackberries, Strawberries, Huckleberries, Sweet Corn, Tomatoes, Pumpkins, Egg Plant, Sweet Potatoes, Lima Beans, Peas, etc., which are of firm quality and sell at highly profitable prices, even when the market was overstocked with fresh fruit. The bountiful returns in good money through this avenue for fruits that probably would be wasted, may be the means of making many a farm profitable that now barely pays expenses.

SAVORS OF THE SOIL.

HOOKED, HARROWED AND HARVESTED.

An exchange tells how lawn mowers may be repaired. Up to date, however, no one has given a recipe for repairing the man who shoves the lawn mower.

"Pa," asked Walter, "what is a Bnddhist?" "A Buddlist, my son," replied pa, "is a—well—a sort of horticultural chap—you've heard of budding fruits, you know."

"This milk is rather warm for such a cold morning," said a customer the other day to a milk boy. "Yes, father put hot water in it, instead of cold, to keep it from freezing," was the simple and truthful reply.

"There was countless millions of mosquitoes down on the marsh to-day," said Johnny. "Johnny," said maunna, "don't exaggerate." "I don't zaggerate, ma; there was countless millions, for Jimmy Brown and me counted 'em."

To keep her boy from the school board, a London fruit seller adopted the expedient of putting him into an orange box, which was safely corded up and shoved under the bed whenever she had occasion to go out, remaining there till her return.

A GOOD JAM.—Place one finger in the crack of a door. Shnt the door slowly but firmly, and keep it closed for at least ten seconds. Then open the door and remove the finger, and add plenty of spicy interjections. Never use your own finger if you can avoid it.

Man is a harvester. He begins life at the cradle; learns to handle the fork; often has rakish ways and sows wild oats, threshes his way through the world, and when he arrives at the sere and yellow leaf. Time mows him down, and his remains are planted on the hillside.

"Speakin' of productive soil," said the mau from Dakota, "the half has not been told. A few weeks ago my wife said, 'Why, John, I believe you've took to growin' again.' I measured myself, and I hope Gabriel 'll miss me at the final roundup, if I hadn't grown six inches in two weeks. I couldn't account for it for some time, till at last I tumbled to the fact that thar war holes in my boots, an' the infernal soil got in thar an' done its work."

A girl brought up in the city, married a farmer whom she loved and desired to make happy. Having heard him speak of being fond of hard elder, and learning the use of a hand elder-mill she saw in the shed, she bought a couple of bushels of Apples, and presented them to him on his return, explaining why she got them. On examining them he said: "These are not good for this purpose, they are as green and hard as can be." "Why," she lovingly replied, "I heard you say you liked hard elder, and so I selected the hardest Apples I could find." He gave her a kiss, and said not a word. A naughty paper said he was a young husband. Well, we hope he will always remain young, in heart at least.

WEBSTER'S PRACTICAL

Probably all of our readers have occasion to use a dictionary every day. In some cases words cannot be correctly spelled; in others, the pronunciation is difficult; while in still other cases the meaning is not understood. This is true, not only of children and of the uneducated, but of many of the more intelligent as well; and every one who attempts to do without Webster's Practical Dictionary attempts to do without one-half of his opportunities for intellectual improvement.

Webster's Practical is an entirely new work by the editors and publishers of Webster's Unabridged and contains more than twice the amount of matter and illustrations ever before offered for the price.

Horse.

- 1, ears; 2, forelock; 3, forehead; 4, eye; 5, eye-lid; 6, nose; 7, nostril; 8, point of nose; 9, lips; 10, nether jaw; 11, cheek; 12, poll; 13, mane; 14, withers; 15, parotid glands; 16, throat; 17, neck; 18, jugular vein; 19, shoulder; 20, chest; 21, ribs; 22, back; 23, loins; 24, hip; 25, flank; 26, belly; 27, hump; 28, thigh; 29, hilt; 30, stifle; 31, leg; 32, tail; 33, hock; 34, cannon or shank-bone; 35, arm; 36, knee; 37, passage for the girthing; 38, elbow; 39, shank; 40, hump; 41, pastern; 42, coronet; 43, foot; 44, hoof; 45, fetlock.

It also embodies several entirely new features which render it pre-eminent to such a degree that for general reference in every household, it will not pay to use even the best of the older works any more than it would pay to journey across the continent in a lumbering old stage-coach while the numerous advantages of a lightning express are available. Those wishing to see sample pages and learn the particulars in regard to these new features before purchasing, should send their address to **S. S. WOOD, Sole Agent, 434 1/2 West 33d St., N. Y.**

Price 1.00; in club with THE AMERICAN GARDEN, only \$1.35 (add 10 cts. for postage.) Send orders only to the publisher of THE AMERICAN GARDEN.

Nearly 1,500 First-Class Illustrations in Webster's Practical.

USE THE ONLY PURE WAUKESHA WATER.

WAUKESHA GLENN,

"QUEEN OF WATERS."

HIGHEST AWARDS OVER ALL OTHER WATERS, NATURAL OR ARTIFICIAL, AS A CURE FOR TROUBLES OF THE LIVER, KIDNEYS, BLADDER, ETC.

"PURE WATER is only to be obtained from NATURAL SOURCES."—Vide Lancet, July 7, 1883.

The dangerous qualities of contaminated drinking water are not obviated by the addition of wines or spirits.—Medical officer Privy Council, England.

Pure water is even more important than pure milk.—New York Herald. The drink of the future.—Moody.

Helped more than two years' skillful treatment.—Samuel Stevens.

I am a living advertisement for this excellent water.—W. Wilson.

Cured of Bright's Disease.—W. Hathaway.

The best merits all praise.—Hon. Geo. H. Peabody.

May the Glenn Spring continue to run Pure Water for ever and ever.—D. W. C. House.

"WAUKESHA GLENN" reigns alone among Natural Dietetic Table Waters. Its numerous competitors appear to have, one after another, fallen away until it has no rival.

With ladies, gentlemen, and *bon vivants* everywhere it has become the standard of dietary expedients, fortifying the digestive functions, and enabling free livers to indulge with impunity at the table. The world of wealth, intelligence and refinement testifies to its sparkling, naturally pure and delightful qualities, as the beverage incomparable, and unequalled in health and exuberant spirits. Endorsed by the Medical Fraternity. It has been tested by thousands, whose unsolicited testimonials are open to the public, and furnished to all who desire. **MAILED FREE.**

Our

THE AMERICAN GARDEN one year
 OUR COUNTRY HOME one year
 GOOD CHEER one year

Irresistible

for \$1.25

Offers.

If ordered before
 JANUARY 1, next.

A year's subscription to *Our Country Home*, or to *Good Cheer*, will be given to any one who sends in a new subscription to *The American Garden*, and the same to the new subscriber; Both of them to any one who sends in 2 new subscriptions to *The American Garden*, and the same to both of the new subscribers.

After Jan. 1 the subscription price of *The American Garden* will be \$2.00.

GOOD CHEER.

Good Cheer is one of the most popular home and family papers in the world. It is pure, clean, bright, wholesome, sparkling, helpful; full of good sense, good morals, good fun, good literature, good cheer, choice stories, anecdotes, poems, biography, history, useful information. Edited by Kate Upson Clark, assisted by a corps of literary talent equal to that of the great magazines: 20 to 24 pages, monthly: well printed on good paper. In a little over three years' time it has grown to 100,000 circulation. (Price 50 cents.)

OUR COUNTRY HOME.

Our Country Home, a monthly journal of agriculture and country life, is one of the greatest successes among all farm papers. Acknowledged to be one of the best, most reliable, best edited and brightest papers of its class. Edited by E. H. Libby, assisted by F. D. Curtis, E. S. Goff, F. D. Coburn, I. K. Felch, E. E. Rexford, and Mrs. Mary C. Hungerford, with numerous equally able contributors. Full departments on the Field, Garden, Dairy and Stock, Poultry, Swine, Law, and Home and Public affairs. (Price 50 cts.)

Separately the three periodicals cost \$2.00; together only \$1.25; after January 1, \$3.00.

 Should be found in every rural home.—*Prof. W. R. Lazenby.*
 Contains just what the people want, served in the most palatable style.—*P. T. Quinn.*

OUR PREMIUM COMBINATIONS.

Books on Gardening.

Choice Special Periodicals.

A Few Choice Implements.

We have taken special pains in the selection of the following books and periodicals, etc., and, so far as we know, there has never been a more attractive series of combinations offered to people interested in Horticulture.

The form and method of the offers is, we think, ENTIRELY NEW. (a.) We quote a price for THE AMERICAN GARDEN together with the article mentioned, and (b.) we also offer each article as a premium for a club of subscribers.

It will be seen that the prices first named are in most cases the usual price of the premium alone.

(a.) (b.) WHO CAN GET THE PREMIUMS?—The offers (a) at the head of the paragraphs are for other old or new subscribers. The offers (b) at the foot of the paragraphs for one "new" subscription are only to those who are themselves subscribers; the clubs of two or more may include the sender's name.

Please send orders to our Greenfield Office.

1.—(a.) For \$5.00, *The American Garden 2 years (or 2 subscriptions) and Downing's Fruits and Trees of America; Or, the Culture, Propagation and Management in the Garden and Orchard of Fruit Trees generally.* With descriptions of all the finest varieties of Fruits, native and foreign, cultivated in this country. By A. J. Downing. Second revision and correction, with large additions. By Charles Downing. Over 1100 pages, with several hundred outline engravings, with latest Supplements. It contains the names and synonyms of over 10,000 varieties. Svo cloth. (Price \$5.00.) "As a work of reference it has no equal in this country, and deserves a place in the library of every pomologist in America."—*Marshall P. Wilder.*
 (b.) Given as a premium for 10 subscriptions to *The American Garden* at \$1.00. Add 25 cts. for postage.

2.—(a.) For \$2.00, *The American Garden 1 year, and Downing's Selected Fruits.* From Downing's Fruits and Fruit Trees of America. With some new varieties, including their Culture, Propagation and Management in the Garden and Orchard, with a guide to the selection of Fruits, with reference to the Time of Ripening. By Charles Downing. Illustrated with upwards of 400 outlines of Apples, Cherries, Grapes, Plums, Pears, &c. None but Choice and Test Fruit are named, and with synonyms amount to over 2,500 varieties. 12mo cloth. (Price \$1.50.)
 (b.) Given as a premium, sent prepaid, for 3 subscriptions at \$1.00 each.

3.—(a.) For \$5.00, *The American Garden 2 years (or 2 subscriptions), and The Illustrated Dictionary of Gardening.* Vol. I. (Price \$5.00.) A Practical Encyclopedia of Horticulture, for Gardeners and Botanists. By G. Nicholson and his assistants. To be completed in three volumes. A Unique and Exhaustive Work, in which the practical information and Botanical classification have been brought down to present date. The number and beauty of its illustrations are without a parallel in any book on Gardening. Over 2,000 first-class Engravings will be given in the complete work. Vol. I, A to E, now ready. Cloth, 4to. 520 pages.
 (b.) Given as premium, one volume, for 10 subscriptions to *The American Garden* at \$1.00 each. Add 25 cts. for postage.

Continued on next page.

4.—(a.) For \$3.00, *The American Garden* 1 year, and

Barry's Fruit Garden. A standard work on Fruits and Fruit Trees; the author having had over 30 years' practical experience at the head of one of the largest nurseries in this country. New Edition, revised up to date—Invaluable to all Fruit growers. By P. BARRY. Illustrated. Cloth, 12mo. (Price \$2.50.)

(b.) Given as a premium for 5 subscriptions to *The American Garden* at \$1.00 each. Add 15 cts. for postage.

5.—(a.) For \$2.00, *The American Garden* 1 year, and

Thomas' American Fruit Culturist. (Price \$2.00.) New, Revised Edition, with practical directions for the Propagation and Culture of all Fruits adapted to the United States. By John J. Thomas. Illustrated with 519 Fine Wood Engravings. In one handsome 12mo volume of 593 pages, bound in extra Muslin. In the present (ninth) edition, a general revision of the work is made throughout, and among the added portions are descriptions of the newer Strawberries, Raspberries, Peaches and Grapes; lists of some of these fruits once famous, but now passing out of cultivation; directions for pruning orchards; construction of fruit houses and the best modes for storing fruits; new illustrations of budding and grafting; management of Orange groves in Florida; and a thorough revision of the Descriptive List and Index by the addition of all noted new sorts.

(b.) Given as a premium for 3 subscriptions to *The American Garden* at \$1.00 each. Add 15 cts. for postage.

6.—(a.) For \$2.50 *The American Garden* 1 year, and

Long's Ornamental Gardening for Americans. A Treatise on Beautifying Homes, Rural Districts and Cemeteries. A plain and practical work at a moderate price, with numerous illustrations, and instructions so plain that they may be readily followed. By Elias A. Long, Landscape Architect. Illustrated, Cloth, 12mo. (Price \$2.00.)

(b.) Given as a premium for 4 subscriptions to *The American Garden* at \$1.00 each. Add 15 cts. for postage.

7.—(a.) For \$6.00, *The American Garden* 3 years (or 3 subscriptions), and

One Year's Sketch Book. By Irene E. Jerome. See specimen illustration on page 217 of this issue. An original series of illustrations, from nature, comprising forty-six full-page pictures (9½ x 14 inches) of great power and beauty, engraved in the best manner and at a great expense. The illustrations are full of life and color. Natural beauties are taken from all the year around. Scenes of Spring, Summer, Autumn, and Winter, in landscape and water sketches, by flashes of sunlight and straggling moonbeams, in every variety of shape, shade and color, mingle with gems of poetry applicable to the season. The volume is elegantly bound in black and gold. (Price \$6.00.)

(b.) Given as a premium for 10 subscriptions at \$1.00 each. Sent by express.

8.—(a.) For \$15.00, *The American Garden* 5 years (or 5 subscriptions), and

Orchids, The Royal Family of Plants. (Price \$15.00.) With illustrations by Harriet Stewart Miner, comprising twenty-four magnificent specimens in colors, each 10 x 14 inches, reproductions of some of the most celebrated and costly varieties of this peculiar branch of the floral kingdom. The collections from which these illustrations have been made are among the best in this country. The volume is 14 inches in length, 11 inches wide, 1½ inches in thickness; gilt edges, bevelled boards, and richly adorned in black and gold, making a beautiful book. Cloth, full gilt.

(b.) Given as a premium for 20 subscriptions at \$1.00 each. Sent by express.

9.—(a.) For \$2.00, *The American Garden* 1 year, and

Mushrooms of America, Edible and Poisonous. (Price \$2.00.) Carefully colored lithograph plates, showing 23 species of Edible and Poisonous Mushrooms, with full descriptions, and best manners of cooking the edible sorts in brief, concise form. By Julius A. Palmer, Jr., who for ten years has carefully studied Mushrooms with a view to their edible qualities. Published by L. Prang & Co., in the perfect manner this house is noted for. By its use one can readily learn to detect poisonous or edible Mushrooms. In the form of two charts, on heavy paper, for hanging on the wall; or the same in 12 colored plates and 4 plates of text, in strong portfolios.

(b.) Given for 3 subscriptions at \$1.00 each. Add 12 cts. for postage.

10.—(a.) For \$1.35, *The American Garden* 1 year, and

Webster's Practical Dictionary. (Price \$1.00.) A new departure in dictionaries. Undoubtedly the best cheap dictionary ever published.

See special advertisement of this offer on page 111 of cover.

(b.) Given as premium for 1 new subscription at \$1.00. Add 10 cts. for postage.

SPECIAL CLUBBING COMBINATIONS WITH LEADING PERIODICALS.

11.—(a.) For \$5.00, (or more,) *The American Garden* 1 year, and

Any Periodicals Published in the U. S. to the amount of \$5.00 (or more) at the publishers' regular prices for single subscriptions.

(b.) \$5.00 worth of periodicals in U. S. given as premium for 12 subscriptions to *The American Garden* at \$1.00.

12.—(a.) For \$1.25, *The American Garden* 1 year, and

Good Cheer, the phenomenally successful literary paper for the family, and **Our Country Home**, a monthly journal of agriculture and country life. (Price 50 cts. each.)

(b.) Given as premium for 2 new subscriptions to *The American Garden* at \$1.00.

See full particulars on page 227.

13.—(a.) For \$2.75, *The American Garden* 1 year, and

Good Housekeeping (1 year). (Price \$2.50.) A semi-monthly journal "Conducted in the Interest of the Higher Life of the Household." Conceived in a spirit of real love for the promotion of "the homes of the world," and executed by some of the wisest and brightest of practical men and women who have ever worked for this good cause. Good Housekeeping merits the warm reception and great success it is meeting with. Illustrated, and beautifully printed on fine paper. (Price \$2.50.)

(b.) Given as premium for 5 subscriptions to *The American Garden* at \$1.00 each.

14.—(a.) For \$1.20, *The American Garden* 1 year, and

Green's Fruit Grower (1 year), a quarterly journal of fruit culture. Bright, reliable, full of solid information and good sense, written in a style that it is a real delight to read; and the book, **How to Prune and Grow Fruit**, by Chas. A. Green, well written and thoroughly reliable, covering all phases of the subject. (Price of paper and book 50 cts. each.)

(b.) Given as premium for 1 new subscription to *The American Garden* at \$1.00.

A FEW CHOICE IMPLEMENTS.

15.—(a.) For \$3.00, *The American Garden* 1 year, and

Little Detective Postal Scale. (Price \$3.00.) Weighs 14 oz. to 25 lbs. Hundreds of thousands sold. The best of all low-price scales; equal in value to any \$5 or \$10 scale we have seen. For House or Office it is equally efficient. One side of the beam shows the cost of postage in cents of any article weighed. Specially fine for seedsmen and

nurserymen. Sent by express.

(b.) Given as premium for 5 subscriptions to *The American Garden* at \$1.00 each.

16.—(a.) For \$18.00, *The American Garden* 5 years, and

Stevens' Hunter's Pet Rifle. (Price \$18.00.) Weight about 5 14 lbs.; length of barrel, 18 inches, good for 40 rods: 22 rim, 32, 38 or 44 calibre; rim or central fire; with combined sights. That it is made by J. Stevens & Co., is proof of its quality. A specialty, first made for a geological surveying party going to the Rocky Mountains, who wanted a gun to knock over a bear, which would be as light and portable as possible. Each gun thoroughly tested and remarkably accurate. With it you can knock over a woodchuck, or animal of similar size, 50 rods away, with great certainty, and some state that they do even better work at a quarter of a mile away. All of the "STEVENS" arms are made for every day folks, and at a price within the reach of all; require no fixings and no previous knowledge of arms; no special cartridges.

The publisher of this journal has always loved a gun and began to shoot at 10 years of age, though hard work and the business of life has kept him from this pleasure in late years. But he thinks that boys should be early taught the proper use of guns, and that only good guns should be put into the boy's hands. That is one motive for making this offer, and for selecting so good and low-priced a weapon as the "Stevens' Hunter's Pet."

(b.) The 18-inch "Pet" given as a premium for 30 subscriptions at \$1.00 each.

17.—(a.) For \$12.50, *The American Garden* 4 years, and

Stevens' Single Barrel Breech-Loading Shot-Gun. (Price \$12.50.) With forehand stock and Stevens' patent bolt; 12, 14 or 16 gauge; weight 6 to 7 lbs.; length of barrel 28 to 32 in.

[Testimonial:] 575 GREENWICH ST., N. Y.
My Single Barrel needs a new catch. I had it this summer down in Virginia, and used it in preference to my double gun, and don't want anything better as to shooting quillies. It has been shot in the past two years over 2000 times, and has required no repairs since I bought it.

Sent by Express.

ROBT. GORDON.

(b.) Given as premium for 20 subscriptions to *The American Garden* at \$1.00 each.

18.—(a.) For \$1.75, *The American Garden* 1 year, and

Maier's Common Sense Knife. (Price \$1.00.) A Jack Knife, a Pruning Knife, a Budding Knife, all in one. No knife ever met the wants of so many people as this has done; there are thousands in use by fruit growers and nurserymen, from Maine to Texas and in

orange groves of Florida and California. Sent postpaid.

(b.) Given as premium for 3 subscriptions at \$1.00 each.

1518 E. Main St., Richmond, Va.,
July 25, 1885.

MR. BENJ. HAMMOND, Fishkill-on-Hudson, N. Y.:

DEAR SIR—This is the second year I have used "Hammond's Slug Shot" on Cabbages, Potatoes, etc., and beg to testify to its efficacy in quickly clearing out Cabbage Worms, Potato Bugs, etc. It is the cheapest and best preparation I have ever tried, and should be universally used as a cheap exterminator of insects preying upon vegetable products.

I have sold a quantity of it which has given universal satisfaction.

Yours Truly,

T. W. WOOD.

"GOLDEN QUEEN"

the most desirable of all raspberries. The American Garden

A Monthly Journal of Practical Gardening.

Dr. F. M. HEXAMER, Editor.

Vol. VI. (Old Series, Vol. XIII.)

OCTOBER, 1885.

No. 10.

The American Garden.

TO STRANGERS.

This number of THE AMERICAN GARDEN is sent to several thousand intelligent people who ought to be interested in its contents, and which to many of them ought to be worth a good many times the subscription price of only \$1.00. "Now" is peculiarly the time to subscribe, for on January 1st the price will be raised to \$2.00 a year, so great is the expense of making so good a magazine as this. Furthermore, all subscribing now will get the numbers for the rest of this year without extra charge.

A CHANGE IN THE SUBSCRIPTION PRICE

Of The American Garden.

After January 1st next, the subscription price of this magazine will be \$2.00 a year. This change is made because of the great expense of making such a journal as this, and because we propose to continue making improvements and increasing its size as circumstances may dictate or require. We feel sure that readers will endorse this movement, as many of them have already expressed surprise at the low price of the magazine.

All present subscribers, even if their subscriptions expire after January 1st, have the privilege of renewing at \$1.00, and also of subscribing for 2, 3 or 5 years at \$1.00 a year, providing only that their orders are sent in before January 1st.

THE COMMITTEES

FOR THE AWARD OF THE AMERICAN GARDEN'S TEN \$100 PRIZES.

The following gentlemen have been appointed by the Society of American Florists, as the committee from that society to award the two \$100 prizes (Nos. 9 and 10) offered by THE AMERICAN GARDEN. The gentlemen are so well known that all will feel sure that their awards will be just.

John Thorpe, Queens, N. Y.; Bob Craig, Philadelphia, Pa.; Bob Halliday, Baltimore, Md.; E. G. Hill, Richmond, Ind.; Harry Sunderbruch, Cincinnati, O.

THE CINCINNATI MEETING.

Mr. John Thorpe, who has done so much hard work in the organization of the Society of American Florists, has reason to be proud of the great success of the first annual meeting. In a private note expressing his regret at our enforced absence from the meeting he says: "We really had so much meat to digest there was more than enough for all. The work has been heavy but the result has justified it, and I am satisfied. We shall have a glorious meeting at Philadelphia. I never saw such harmony, such eagerness for information and such talent at a new organization before. The people of America will be benefited by the Society of American Florists' transactions to a great degree, and if only for that I shall not regret the labor spent in the work."

\$500 TO \$1,000 OF PROFIT ON AN ACRE OF LAND.

One thousand dollars profit from an acre of ground may seem incredible, nevertheless it has been made a thousand times, and is being made every year by those who know how. The celebrated Celery lands near Kalamazoo, Michigan, a few years ago were a bog-swamp without any value whatever, until some enterprising gardener conceived the idea to drain the land and grow Celery on it. These fields are now as valuable as any farming land in the State; a ear-load of Celery is shipped from the place every day, many thousand-dollar-profits per acre have been made there, and many growers have retired with a fortune made, within a few years, by growing Celery.

Mr. P. M. Angur's Strawberry field at Middlefield, Conn., mentioned in our last number, which yielded 16,000 quarts of berries per acre, must certainly have yielded a profit of over \$1000. At Irvington, N. J., Mr. I. E. Brown sold from a piece of ground a little short of an acre, planted with Great American Strawberries, \$1,800 worth of berries. He manured heavily, using 100 tons of stable manure, but the expense of cultivation was very light, so that after deducting all expenses, the profits amounted to considerably over \$1000. With the use of glass for hot-beds and cold-frames three and four crops of vegetables may be grown in one year, yielding under favorable conditions still larger profits.

These instances of large profits are not cited with a view to induce anyone to leave a paying business and to embark in market gardening expecting to realize a fortune in a short time, but that they might serve as a stimulus to those who are plodding in old ruts, barely earning a living, and to show them that by progressing with the times, and by adopting improved methods, they may increase the products and profits of their gardens manifold.

OUR \$100 PRIZES FOR BEST VARIETIES.

There seems to be some misunderstanding of our offers (see page 247). In a few words, our plan is simply this: to have these valuable prizes given to the best varieties, as named, which may not have been offered for sale previous to May 1, 1885. The conditions named are only for the purpose of getting as fair and broad tests of the varieties as possible. We believe that the committees will judge and award with impartial fairness, and possibly they may consider that the conditions we have given will require modification. We doubt if any mere technical points of form will be allowed by the committees to stand in the way of the fair competition of any variety. They will undoubtedly see that the best will be given their due honors.

HOW

THE SUCCESSFUL FRUIT GROWERS AND GARDENERS

HAVE WON THEIR GREAT SUCCESSES,

Will be told in a series of articles soon to be begun in these columns. They will be written by the "kings" of horticulture, and will point the way plainly for others to go and do likewise. There is a demand for all of the first-class orchard and garden products that can be grown.

PHINEAS BROWN HOVEY.

Mr. P. B. Hovey, whose death we briefly noticed in a recent number, was one of the founders of the Massachusetts Horticultural Society, whose first meeting was held in his store in Cornhill, Boston, in 1829. He was store in Cornhill, Boston, in 1829. He was its vice president five years, chairman of its committee of arrangements ten years, and a member of its fruit committee twenty-four years. All his life he took an earnest interest in the promotion of horticulture, beginning as a boy to know and cultivate flowers for very love of them. He began his business life as a florist, and in 1834 became the head of the firm of Hovey & Co., seedsmen and nurserymen, which established its store in Cornhill street, and was afterwards for twenty years at No. 7 Merchants' Row, finally moving to the present stand of the house at 16 So. Market Street, and with which he remained until 1883. In all those years Mr. Hovey was a recognized leader in horticulture, and his advice was often sought by those interested in similar pursuits. Mr. Hovey reached the honorable age of eighty-one years, nine months, and the society with which he was so long connected took appropriate means of recognizing their loss.

THE DEACON LETTUCE.

Mr. Goff's article on Lettuces has brought so many calls for the "Deacon" that our good friend Mr. Joseph Harris of Rochester, N. Y., its introducer, kindly offers to send a package of the "Deacon" seed to any readers of the GARDEN who will send him their names.

A GLADIOLUS EXHIBITION.

The large, commodious warehouses of P. Henderson & Co., in Cortlandt St., New York, presented a brilliant scene on the 25th and 26th of last month, when the firm treated its friends and patrons to one of the finest Gladiolus shows held in this city. Every available space was made use of in embellishing the place with flower spikes. All the leading varieties, old and new, were represented, and, being plainly labeled, offered a convenient opportunity for study as well as a guide to those desiring to make selections. The massive effect of the large groups of mixed varieties was almost dazzling.

In addition to Gladioluses, although these formed the leading feature, were several tastefully arranged collections of Lilies, Verbenas, Asters, Petunias, Phloxes, Uvarias, Foliage Plants, etc. We noticed also some choice collections of vegetables, twenty-four varieties of Tomatoes, twelve varieties of Peppers, seven varieties of Cucumbers, Egg Plants, etc., all of great perfection.

Many of our prominent professional and amateur horticulturists were among the visitors. The effect of such exhibitions cannot but be beneficial in developing a taste for the culture of flowers.

PENNSYLVANIA HORTICULTURAL SOCIETY.

The annual Chrysanthemum Exhibition will be held in Horticultural Hall, Philadelphia, from November 10th to 13th. The Premium List is very complete, and the prizes so liberal that an exhibition of extraordinary excellence may be counted upon. Premium Lists may be obtained on application to the Secretary, A. W. Harrison, Horticultural Hall, Philadelphia.

Vegetables.

SEASONABLE HINTS.

To supply the lack of vegetable matter in the soil, there is no readier and cheaper means than the plowing under of some green crop.

Manuring with Rye is an excellent way to ameliorate and enrich a garden. The advantages of this plan outweigh the expense and labor manifold. After the crops have been removed the ground should be plowed or spaded, harrowed or roughly raked with a prong hoe, then seeded to Rye at the rate of two to three bushels per acre and harrowed or raked in.

The seed will soon come up, and the green growth presents a cheerful and pleasing appearance all winter when the ground is bare of snow. In spring, just before the land is to be planted again, the Rye is turned under. It will soon decay and leave the ground in a mellow and friable condition which will be perceptible for several years; but there is no reason why such a system should not be followed every year, at least in alternate parts of the garden.

Celery.—When banking up Celery, it is important that the soil which is drawn around the stalks should be in a mellow condition. This is best accomplished by keeping the ground well cultivated at all times. A prong hoe drawn along each side of the row does the work completely.

Sometimes it is found difficult to keep the soil from working in between the leaves and stalks when banking up. By wrapping a piece of soft oil-cloth around the plants, drawing and pressing the soil against it, and then withdrawing the cloth, the danger of the soil covering up the heart of the plant is avoided.

Selection of Seeds is of far more importance than is generally understood. The earliest ripening seeds are, as a rule, the best; and by selecting systematically the earliest and most perfect seeds for a succession of years, superior strains of vegetables may be produced.

Bushel Boxes of some light wood are in some respects more convenient for digging, marketing and storing Potatoes and various root-crops than baskets or barrels. They should be made of uniform size, so as to fit closely together, and if well made, will last a life time. A box measuring inside 16x13x13 holds, when level full, a good, liberal bushel.

Perennial Vegetables, of which Asparagus and Rhubarb are the most prominent representatives, may be planted now to good advantage, provided the ground is in proper condition. Fall-planting of any kinds of plants or trees is not advisable on heavy, wet land, but where the soil is light, and naturally or artificially under-drained, much may be done in this direction to relieve the pressure of spring work.

SULPHUR AGAINST POTATO BUGS.

Last spring when planting Potatoes, Mr. M. A. Barber of Wyoming Co., N. Y., put a teaspoonful of sulphur in each hill of fourteen rows in the middle of the field. The rows were 25 rods long, and were not attacked by bugs at any time, while those immediately along side of them and all those

not so treated suffered severely and had to be dusted with Paris green. The varieties were Early Sunrise, Beauty of Hebron and Burbank, and the rows of plants that had the sulphur were decidedly the most vigorous of any in the field.

We are not prepared to offer an explanation of this singular result, but as the experiment is not expensive and is easily made, it is well worth extensive trials.

THE TOMATO.

NOTES ON VARIETIES.

Among the more promising varieties of Tomatoes of recent introduction, the Optimus, introduced I believe the present season by Messrs. Ferry & Co., will perhaps take the lead. In form and color it resembles Livingston's Favorite, but with us it ripened its first fruit eleven days earlier. It should be remembered, however, that comparative earliness of different varieties of the Tomato is by no means constant. Plants moderately vigorous, with deep green foliage, fruit borne in clusters of two to four each, distinctly flattened, remarkably smooth and regular in form; bright scarlet; two-and-a-half to three inches in diameter; basin (hollow at the blossom end) very small, or oftener entirely wanting; cavity (hollow about the stem) shallow and scarcely furrowed; cells, three to six. The flesh is firm and of excellent quality.

The Emery (Farquhar) is of rather more vigorous growth, and a little larger in size than the Optimus. In form it is rather less regular; in season about two weeks later.

The Fulton Market of Tillinghast, which seems to be the same as the Essex Round Red Smooth of Gregory, is a vigorous growing variety, with roundish or slightly flattened, very smooth and regular, bright scarlet fruit, two to two-and-a-half inches in diameter; basin very small or wanting, cavity shallow, very little furrowed; cells two to five, flesh firm and of good quality; ripened a week earlier than Optimus.

Early Richmond (Landreth) in our test, bore fruits too much furrowed and too irregular in form to make a desirable variety. In season about the same as the last.

King Humbert. I have been much interested in this variety, because it seems to offer a new type of fruit. So far as I know, this is the first strictly two-celled red Tomato that has been sufficiently large for table use. The two-celled Tomatoes are invariably smooth, and are usually earlier than the many-celled varieties, facts that should not be forgotten by the growers of new varieties of this vegetable.

The plant of the King Humbert is very vigorous and productive. The fruit is oval, slightly flattened longitudinally, and thickish towards the blossom end; very smooth; with neither cavity nor basin, bright scarlet, about one-and-three-fourths inches in longest diameter, and two-and-a-half inches through the axis; borne in clusters of from five to nine. The flesh is remarkably thick and firm; so firm indeed, that fruits picked and placed in a dry room will shrivel like an Apple before decaying.

The French Upright or Tree Tomato, Tomato-de-Laye of the French, possesses one character that if combined with earliness would make it extremely valuable. It is up-

right in habit and usually so strong as to be self-supporting. The fruit is of good quality but so late that it is scarcely worth growing in this climate. Could an early variety with the habit of the Tree Tomato be secured, it would be adapted to culture in frames, and thus would be extremely valuable, and thus would be extremely valuable. We are working in this direction and have growing several hundred plants from the French Upright fertilized with the Acme, Livingston's Favorite and Alpha Tomatoes. Some of these seedlings promise to be at least as early as many of the varieties of the common Tomato.

The Rochester Tomato introduced in 1883 by Messrs. Sibley & Co., bears a few remarkably fine fruits, but unfortunately the majority are quite mal-formed. With us, it rots badly.

Some strains of the Mayflower retain the original good quality of this variety, while others have much degenerated. It is possible that this and the Rochester were sent out prematurely. I find in my experience that it takes at least four generations to fix the character of a Tomato secured by crossing.

The Trophy as grown by us through four years, from seed of our own saving, is evidently deteriorating in quality. How much if any of this retrogression is due to cross-fertilization, I do not know. As the fruits of the Tomato vary so much on the same plant it is very difficult to understand how many distinct varieties we have. It is probable, however, that our list of catalogue names may be considerably reduced.

"ELM."

New York Agricultural Experiment Station.

MANURING IN DRY SEASONS.

How to guard against the evil effects of drought as much as possible, is always one of the leading questions with the gardener and farmer, and the following incident may prove suggestive to some readers of THE AMERICAN GARDEN.

Last year a piece of ground that had been quite liberally enriched with commercial fertilizers yielded but a moderate crop of Dwarf Beans, while an adjoining piece of ground to which manure from the horse-stable had been applied, produced a remarkably good crop of the same kind of Beans. The inference from this was that in the first instance the drought prevented the full action of the fertilizer, which had only been harrowed in on the surface, while in the other piece the stable manure retained sufficient moisture and furnished nourishment for the crop. Taking this as a hint I adopted the following plan.

After plowing and harrowing my ground, I made deep furrows across the field at a distance of five feet from each other. Into these I deposited stable manure to the amount of 12 or 14 loads to the acre. This manure was covered by a light, single-horse plow throwing a furrow on it from each side. On the intervals between the ridges I scattered superphosphate. Then I planted in the shallow furrows each side of the ridges, leaving still space enough between the ridges for the horse and cultivator.

On an acre and a half the work of plowing, manuring and ridging was done last fall, and as soon as the ground would do to work this spring, I used Mypos soil-lifter in

the shallow furrows, not putting on the superphosphate till this spring, and opening the furrows again with a light plow. In this way, with comparatively little labor this spring, I have planted early Peas on one side of the ridges containing the manure, and early Potatoes on the other side. The advantages that I am hoping to secure are:

1. The roots of whatever is planted along the ridges will be at liberty to extend into and under the yard manure, where they will find both moisture and richness in a dry time if it is anywhere. The manure covered with soil serves as a mulch and nourishment.

2. The concentrated fertilizer is as available as ever on the other side of the plants where the cultivator runs.

3. This method gives opportunity for closer planting—the rows averaging two-and-a-half feet apart, two of them being nearer together with a narrow ridge between. If it is not desirable to have them so near the crops can be put in hills farther apart in the rows.

It may be objected to this method that it involves more hard labor in keeping the weeds down on the ridges that the cultivator cannot reach. This is certainly a valid objection where the ground is full of weed seed, and in such cases I would not recommend this method.

Civilization has many conveniences that would be utterly out of place and impossible in savage society. Just so there are many advantageous methods that can be practiced where land is civilized and free from the barbarism of weeds.

I would not question Peter Henderson's wisdom in recommending 75 loads of yard manure to the acre in his circumstances. It is simply a question of what is wise investment. Where manure and labor are abundant, no doubt these are the things to invest in if markets will warrant. But farmers cannot always invest in that way, and with many who have already invested largely in land the problem is, how to make a moderate quantity of manure go the farthest on a large area of land, and it is towards the solution of this problem that I offer the above observations. H. J. SEYMOUR.

FIGHTING SQUASH BUGS.

Of the large number of remedies recommended every year for this obstinate pest, far the greater part will, upon trial, be found of no practical value whatever. In spite of the so-called remedies the bugs will come, and your crop will be lost if you place your dependence in untried remedies.

If one is diligent and careful enough to destroy the first crop of bugs and their eggs from the start he may often save his vines, but no half measures will do. I tried planting between rows of Potatoes as recommended, but while the Perfect Gem was not troubled, the Hubbard and Boston Marrow were entirely destroyed by bugs. I have used ashes, lime, soot, salt, coal-oil, saltpetre, in various ways, with the object of finding out the specific, but whenever plants were saved it seemed only accidentally, as others so treated did not escape.

The only remedy that has proved effective with me so far is "Slug Shot," if properly applied. It must be dusted on the vines every few days, while the dew is out, and

after every heavy shower that washes it away, else it cannot furnish protection.

An experiment was also made in planting seed two weeks after the main crop, with a view to determine whether the bugs prefer the young and tender growth to the older. Another with covering different parts of the stems to induce more root growth and produce proportionate resistance, but all to no avail. I might have saved many of these vines by careful hand-picking, but as I wished to give each remedy an equal trial I had to

A BUNCH OF CHICORY.

sacrifice a good many vines. If anyone has an infallible remedy I wish he would let the readers of THE AMERICAN GARDEN know it. N. J. SHEPHERD.

TWO LITTLE KNOWN VEGETABLES.

SORREL.

Is used for soups and stews and as a flavoring element in other dishes. The small, shiny seeds, shaped like a grain of Buckwheat, are produced upon tall stalks like the Yellow Dock, which the plant somewhat resembles, having a broad, tender, light-green leaf. The leaves, gathered in sufficient quantity, and dropped in boiling water with salt for a few minutes, will make a dish of "sour greens" without the addition of vinegar.

LARGER LEAVED FRENCH SORREL.

The seed of the large-leaved French Sorrel planted in the spring, will continue to grow in the soil for years, will endure the shade and neglect, and can be cut for salad as often as wanted; is perfectly hardy, and can be transplanted with ease.

CHICORY.

Sow the seed early in the spring in rows 15 inches apart, as it has a broad, branching top. This plant is distinct from Endive; in the Chicory the root is the most valuable

part, and in the Endive the top is eaten; but they are so near related that the top of the Chicory can be blanched and eaten also, while the Endive root may be used like Chicory. Its cultivation is similar to that of Carrots, and it may remain in the ground over winter like the Parsnip, without injury. It is largely used as a cheap substitute for Coffee, by scraping, slicing, drying, browning, grinding and mixing with the Coffee. The root is also boiled and prepared for the table, making a palatable dish. I have not tried it after the second season when it goes to seed, though it would seem to be equally as good. The seed stalks resemble Lettuce in manner of growth, but the flowers are more scattered among the branches and are of a most beautiful blue color. In form they resemble the Dandelion, but are much smaller and spring from the axils of the leaf. All parts of the plant have a milky juice.

Where there is a demand it may be grown with considerable profit, but except in the largest cities the market for it is too uncertain and irregular to warrant its cultivation other than as an experiment.

W. H. BULL.

HOW TO TELL A RIPE MELON.

The rinds of Melons when left on the vines to mature, generally become hard and the pulp brittle, and when, under pressure, you hear the inside crack or give way it may be regarded as a sure sign that the Melon is ripe, and has matured well on the vine.

If a melon remains on the vine until properly matured the side that lays on the ground will be found to have changed from white to a pale yellow, and upon close examination numerous small pimples will be noticed on the surface, particularly on the outer edge. These pimples never appear on those that are not ripe or have been prematurely pulled.

Sometimes the desirable pale yellow color is produced prematurely by turning this part of the Melon to the sun for a day or two, but the yellow thus produced is of much deeper shade. This in connection with the absence of pimples will readily tell the experienced eye how the color was produced.

If the skin will readily peel, leaving a hard, shelly appearance, it is a good indication that a Melon is ripe; and also if it has a dull brown appearance. All these signs are rarely seen at the same time, but the presence of any one is sufficient to indicate the ripeness of a Melon.

THOS. D. BAIRD.

FRESH SPROUTS.

Labor is the chief expense in the garden, so it is a great gain to be able to grow good Celery without the laborious trench and banking so long thought necessary.

In our Potato field of eight acres on light, sandy loam, a ton of fertilizer per acre, Pearl of Savoy was the best early sort, Early Rose next, and Vick's Extra Early was a failure. The seed of the two first was first-class, of the last, small and poor.

The Acme Tomato has been more exempt from disease this summer than for several seasons. Last year it rotted so badly with us that we were about to discard it altogether, but it is redeeming itself bravely now. Does season make the difference?

Fruits.

SEASONABLE HINTS.

Fall-Planting.—The question of the advantages of autumn-planting over spring-planting presents itself to many of our readers at this season. With the skillful and careful planter this is merely a matter of expediency. His trees will grow, planted at almost any time, but as at this season there is not so much pressing work, many orchardists prefer fall to spring-planting of trees, vines and plants.

If the ground has been devoted to some hoed crop during summer, it is now in the very best condition for tree planting, and the sooner after the leaves have fallen, the trees are taken up and transplanted, the better. In fact it is a common practice in nurseries to strip the leaves from the trees in order to prepare them for earlier planting, and although this may seem an unnatural procedure, it works well in practice, and is really not more unnatural than pruning roots and branches, or transplanting itself.

In fall-planting great care should be exercised to have the soil come in direct contact with every part of the roots, and to pack it well around every part of them. All the branches should be shortened in at the time of planting, and not allowed to remain till spring, offering additional surface for evaporation.

Planting Nuts.—Most nuts will not sprout after they have become thoroughly dry, and should therefore be planted as soon as ripe. If the ground is in proper condition the best plan is to plant the nuts just where the trees are wanted. A mellow, moderately rich soil, covering the nuts two to three inches deep, and packing the earth firmly over them, is all that is needed.

If it is not practicable to plant in the fall, or where squirrels and field mice abound, which are very apt to steal the nuts, it is better to defer planting till spring. In this case the nuts have to be kept in sand over winter.

To preserve the nuts over winter take a box,—which should not be water tight,—cover the bottom with about three inches of fine sand, spread a layer of nuts over it, cover with sand, and so on, finishing off with a three-inch covering of sand; place out doors and cover with soil. In spring, as early as possible, plant in nursery rows, or in the places where the trees are to remain permanently.

Keeping Grapes.—Only tough, leathery, skinned varieties can be preserved in good condition till winter. It is throwing away time and Grapes to attempt keeping Concord and other varieties with thin skins. Bunches intended for keeping should be gathered when perfectly dry, and handled with utmost care so as not to bruise the berries, wrapped in clean, soft paper, and placed in shallow boxes. The storage room should be dry, and as cool as possible without actual freezing.

STRAWBERRY CULTURE IN CENTRAL NEW YORK.

The most successful growers prefer a good Clover sod, plow it under in the fall, and re-plow in spring, with but little or no manure. The ground is then thoroughly harrowed

and marked out in rows four feet apart. Planting is done with a trowel, the plants being set nine inches apart in the rows, a man planting about 4000 plants—after being trimmed—in a day.

After the plants are set, and before the weeds get a good start, we go twice through a row with a Corn plow and give the plants a thorough but shallow hoeing. In the course of two weeks we repeat the operation, using a cultivator instead of a plow, and again hoe. Plowing and cultivating are then alternated every two weeks from the 1st of June to the 1st of August and as much later as the growth will permit without injury to the young plants; the cleaner they are kept the better. If the season should be favorable, by the last of October the rows will have grown together; then, when cold weather sets in, and the ground remains frozen, we cover with Rye Straw, Henlock boughs or Potato vines.

As soon as danger of severe freezing is past in spring we take off the covering, and plants are dug from between the rows to set another piece. We then go once through between the rows with a Corn plow to mark them out for picking. Nothing more is done to them but to pick and market the crop. The patch is allowed to fruit another season without giving it any care or protection in winter. We then plow under and sow to Buckwheat or fodder Corn; if to Buckwheat, it is plowed under green in the fall and sowed to Rye, and seeded down in grass and Clover. After a year or two it is ready for another planting of berries. Our soil is a gravelly loam with a great many paving stones.

The varieties grown are mostly Wilson and a few Sharpless; of the first we raise about as many bushels per acre as we do of Potatoes. The crop was good this year, prices averaging about six cents per quart.

J. JEANNIN, JR.

THE BLIGHT OF THE PEAR.

Professor Arthur of the New York Experimental Station reports some very interesting investigations upon Pear Blight. The readers of THE AMERICAN GARDEN have already been made acquainted with the theory of the blight in Pear and Apple trees as advanced by Professor Burrill in 1877. Through a long series of microscopic investigations he was convinced that the cause of the blight was due to the presence of minute organisms known as bacteria.

These bacteria are single-celled plants belonging to the order of fungi to which the various moulds, rusts, smuts, toadstools, etc., belong. On account of their smallness bacteria have escaped the notice of all except those who are experts with the higher powers of the compound microscope. Bacteria may be seen by the naked eye *en masse* when they are in large numbers. They develop in all putrefying substances and are now considered as the primary cause of putrefaction. A clear liquid capable of putrefaction may be kept free from decomposition by excluding these germs. The process of canning meats, fruits, etc., is simply one by which the germs of bacteria are killed in the material by high temperature, and afterwards sealed so that germs cannot enter the cans. The germ theory of disease in animals is

based upon the destructive attacks of bacteria. These minute organisms find their way to the animal and if the conditions are favorable the attack is vigorous and death may result. Thus anthrax or splenic fever in cattle is now known to be a well-established case of bacteria disease. The germs can be found in a sick animal. They may be propagated outside of the animal in a glass vessel and afterward introduced into a healthy animal, and in a short time will produce the same disease as was manifest in the first animal. The list of maladies, many of which are most to be dreaded because most contagious, belong to the germ diseases. Some authorities are firm in the belief that all contagious diseases are due to bacteria.

At first thought it may seem to many that this cannot be true. In what better way can the ordinary facts of everyday observation concerning contagious diseases be explained? If a person is exposed to a "catching" disease to what is he exposed? Is it not easiest to think that there are minute germs given off by the sick individual which coming in contact with the well person develop sickness? Why cleanse a room after it has been occupied by a sick person unless to remove the last germ that may be adhering to the wall or other part? Those who know that the germs do exist and in countless numbers, do not need any such argument to convince them. It is to the great mass of people who cannot study these subjects that such thoughts need to be presented.

If the reader can accept the germ theory of disease as illustrated in various fevers, cholera, diphtheria, etc., he is in a position to consider the advanced views regarding the Pear blight. Professor Burrill has proved to his own mind and to many others that this strange disease appearing so suddenly and destructively in the orchard is the result of countless bacteria preying upon the vital juices of the plants. Professor Arthur has taken up the same subject and verified the observations and experiments of Professor Burrill. He found that the disease could be transferred from one tree to another by careful inoculation.

The best results were obtained in the more thrifty parts when growth was rapid. The fruit as well as the leaf and stems were inoculated—those most succulent "taking" the most violent form. Professor Arthur verifies Professor Burrill's conclusion that the blights of the Pear, Apple and Quince are identical. He also found that the June-berry and Thorn were susceptible. Failures to inoculate resulted with the Mountain Ash, Raspberry and Grapes. Professor Arthur thinks it is possible that the trouble is caused by a poisonous principle residing in the fluid surrounding the bacteria or in the dead juices of the plant. It has not been shown that this fluid without the germs will convey the disease or that the bacteria without this fluid will inoculate. The germ theory is not therefore fully proved but so nearly as to be a subject for belief.

Very little that is new regarding remedies is offered. The destruction of all affected parts at the first indications of blight is recommended. Cut off all diseased parts and burn them. It does not seem probable that chemicals applied to the soil will effect any change.

DR. BYRON D. HALSTED.

THE HUCKLEBERRY AND CRANBERRY TRADE.

In the sale of no other kind of fruit is there so much deception practiced as in that of Huckleberries and Cranberries, as there is no standard measure by which the sale can be regulated. In Massachusetts the law requires a bushel to be a thirty-two-quart measure level full, yet as no definite dimensions for such a measure are required, the consequence is that the bushel boxes seen in the markets differ several quarts in their contents.

Some years ago the New Jersey Cranberry-growers' Association had a law passed in which the number of cubic inches a bushel of Cranberries should contain was specified. A New Jersey Standard box contains 2211 cubic inches, a trifle more than the legal standard bushel, which is 2150.42 cubic inches. But unfortunately this law is of little benefit to the growers of the State, for so soon as the packages reach New York, unscrupulous dealers repack the berries into so-called "skin" boxes, which contain from four to seven quarts less than a bushel. A difference of one inch in the width of a standard box will hardly be noticed by the casual buyer, while it will make a difference of four quarts in its contents.

When Huckleberries were first marketed in large quantities, dealers had established regular shipping boxes containing eight and sixteen quarts, but their size did gradually shrink in such a degree that they are hardly recognizable any more. It would be to the material benefit of both growers and honorable dealers if a national standard measure could be adopted for the sale of not only these, but all kinds of fruits and country produce.

C. W. IDELL.

POPULAR GRAPES.

Although no one is ready to drop any of our popular fruits from cultivation and all are enjoyed in their season, it would seem that in none are embodied a greater combination of good and valuable qualities than in the Grape, and if any were to be spared it surely would not be this noble fruit. Comparatively few people realize how easily Grapes may be kept so that a table supply may be at hand through all the winter months.

The Concord is still held in high esteem by many, although we have varieties that in point of flavor are much in advance of it.

Moore's Early, although but a slight improvement in quality, has filled a really long-felt want for a reliable early black Grape. It ripens nearly or quite two weeks before the Concord, the berry is larger and in this locality the bunch averages as large, although I believe this latter point is not generally conceded for it.

The Worden is gaining in favor after standing before the public for several years, but after all does not seem to be much of an improvement on its parent the Concord, which it closely resembles.

Much is claimed for the Early Victor. Though not quite so early as Moore's, it has thus far proven iron-clad so far as mildew

is concerned. The quality is good, not extra. We were promised a fine early variety in the Jessica of Canadian origin. The introducer is candid in admitting that it has shown an inclination to mildew. This should not deter anyone from trying it, however, as it may redeem its character in different localities.

Wonderful claims are made for the Niagara. The introducer of the Jessica, and other fruit growers are authority for stating that in some instances it has mildewed and rotted badly. It is to be hoped, however, that these faults will not prove generally troublesome, as in other respects it possesses highly valuable qualities. It is now being widely disseminated, so that its true character will soon become established. W. H. RAND.

CRANBERRIES ON SANDY LAND.

As a suggestive instance of successful Cranberry culture contrary to the general

of luxuriant vines and great crops of perfect fruit. From this trial-acre, and from other acres since established, an annual yield of 400 bushels of far more perfect fruit than is gathered from the marshes has been harvested. Truly are the "eight acres enough," as Mr. Stillwell enjoys as many of life's luxuries from his little patch as the owners of many large farms.

The sub-irrigating ditches are not over two feet in depth, and the water feebly flowing in them is not over six inches deep, and in parts not three inches. The ditches are never filled except in early spring and in the fall, when danger of frosts—to injure blossoms or fruit—is apprehended. At such times the field can be flooded in about three hours. During the growth of the great crop of fruit the land is as firm and dry on the surface as a cornfield. The supply of water to the roots is from the saturated sand underneath at the level of the water in the ditches.

Above this level the moisture rises by capillary attraction, supplying needed moisture in the natural way. The wonder expressed by all visitors is that such continued crops of even, perfect fruit can be obtained without fertilizers on a sand waste too poor to grow white Beans.

EARLY-BEARING FRUIT TREES.

It is not necessary to wait long for fruit trees to bear, says J. J. Thomas, if early bearers are selected and good cultivation is given them. To adduce instances: In a single garden, Apple trees, the fifth year from setting out, yielded a bushel each; Peach trees, the third summer, bore three pecks; a Bartlett Pear tree gave a peck of superb fruit in two years; although in all these and other equally successful instances the treatment was not better than that which every good farmer gives to his Carrots and Potatoes and other field crops.

SHORT CUTTINGS.

The Strawberry weevil threatens to become a serious obstacle in Strawberry culture. It feeds upon the blossoms in the manner of the Rose beetle. This year its ravages were especially disastrous on Staten Island.

It is stated that in France it is customary to cut off the flower-stalks of Strawberries as they come into bloom, in consequence of which the plants are said to bear a month later. Plants don't behave this way in our country. Cutting off the flowers throws the strength into leaf growth and the production of runners.

It is a notable fact that fruit growers who cultivate but a few acres, usually reap the largest rewards as compared with the extent of their efforts. This, Chas. A. Green thinks, is owing to the fact that they can select the choicest ground, make it exceedingly rich, and give it the best cultivation and protection; whereas large cultivators are compelled to take average land, usually fertilize it sparingly, and cultivate it as they may be able.

THE SWAMP HUCKLEBERRY.

opinion that Cranberries can only be grown on swampy soil—and also of the great advantages of sub-irrigation, Prof. J. L. Budd mentions, in the N. Y. Tribune, the cranberry fields of Mr. O. J. Stillwell, near Sparta, Wis.

The plantation of eight acres, says the professor, is on a level tract of sand, which fifteen years ago was used as a cornfield. The thin deposit of black soil on the surface soon leached into the sand-bed below, leaving a barren sand waste. As the damming of a spring-run near by would permit turning water into ditches running through and across the deserted cornfield, Mr. Stillwell conceived the idea of planting the tract to Cranberries. In the way of trial the water was first turned into ditches about two feet in depth and eight rods apart—both ways—excavated around and across about one acre of the sandy tract. This trial-plot soon astonished owner and visitors with its exhibit

THE CAUSES OF FRUIT-RIPENING.

That great traveller and observer of Nature, Alexander von Humboldt, draws attention to the fact that he found the most delicious fruits at Astrakhan, Tobolsk, and other places in the interior of the Asiatic continent which have an average annual temperature of 48°. This he says is also the average temperature of Ireland and the coast of Normandy, places where the summer barely suffices to bring Apples to maturity, though it permits the growth of so tender a tree as the Myrtle.

To explain this difference Humboldt admits that Ireland and Normandy have the cooler summers, as well as warmer winters, of a coast climate; but he would rather attribute the impeded ripening of fruit in those places to the absence, not of warmth, but of direct sunlight. Two climates may be equally warm, of which one, through prevalent cloudiness, will afford far less sunlight to vegetation; and, he remarks in conclusion, direct sunlight plays a very important part in the maturing of fruits, as the future of agriculture will show.

Humboldt's view is borne out by observation. Some of the celebrated Californian fruit valleys have a summer temperature less intense than ours of New England: but the sunlight pours down from the cloudless sky with steady force, from May to October, losing not a day. I have passed a season without one uncomfortable hour of heat in such a valley, where the landscape showed endless orchards of ripening Peaches, Pears, Figs, Olives, Apriots, Almonds and Nectarines. Other valleys are less temperate.

The experience of wine-makers reveals a similar truth. The vintage of '75 in France was poor in quality: yet in that year the average summer temperature stood high. But it was a season deficient in sunlight, as shown by the actinometer—an instrument for measuring the direct heat of the sun.

Pasteur, the French scientist, who has successfully investigated the causes of cattle disease, was struck by this fact, and attempted to explain it by exposing raw wine in glass jars to direct sunlight, keeping other similar jars in ordinary light for the purpose of comparison. The effect of the sunlight was very manifest. In the exposed jars the acids of the raw wine decreased by oxidation, rapidly improving the quality of the wine; while the other jars showed no change.

It is a reasonable inference from this, that the same process occurs in ripening Grapes and other fruits exposed to sunshine. The direct sunlight causes the acids of the green fruit to combine with oxygen and so disappear, and the fruit thus loses its acidity, at the same time that it is being supplied with sugar from the general food-stores of the plant,—the whole process constituting what we call "ripening." Whether the sunlight is as essential to the increase of sweetness as to the decrease of acidity, is uncertain; though it has been shown that a detached bunch of Grapes will contain more sugar if exposed to the sun for some time. Pears, we know, ripen in a closet.

The above facts show that two studies have great importance for agriculture: first, the study of the effect of direct sunlight on vegetation; second, the study of the distribution of sunlight in various climates. The

last problem cannot be very difficult,—“When the sun shines, it shines; when it doesn't, it doesn't,” someone exclaims. Unfortunately the question is not so simple. Not only do clouds intercept sunshine, but watery vapor in the air—when to the eye the sun seems as bright as ever—can absorb a large quantity of the effective sun rays, and so retard fruit ripening. Hence, an apparently sunny country which has much invisible watery vapor in the air, owing perhaps to a near-lying ocean, will prove defective in fruit-ripening qualities.

This is a further explanation of the fruit-ripening power of the Californian summer; for it is a summer characterized by very dry air. This presence of watery vapor can be revealed only by certain specially constructed instruments; and the French government has thought the subject of sufficient importance to warrant establishing a station for experiments with these instruments.

There is, indeed, one fact in the distribution of sunshine over the earth's surface that seems paradoxical. The farther north we go the more heat does a given area of land receive in a summer's day from the sun.

This is because the summer day lasts 12 hours at the equator, and longer and longer as we go north, until arriving at very high latitudes there is no sunset. Why then the colder northern climate? Because the winter day is as short as the summer day is long; and through the winter vast masses of snow and ice accumulate and chill the whole year. Yet the fact remains, that an acre of Wheat receives more of direct sunlight in a summer's day in Ohio, than in Mexico, and more in Canada than in Ohio. It is also known that Wheat matures in fewer days in Canada than in Ohio, and in Ohio than in Mexico. This shows the influence of sunlight in ripening grain and fruits.

XENOS CLARK.

REVIEW OF THE BERRY MARKET.

Out-door grown Strawberries are offered in the New York markets for about eight months in the year, and during the greater part of this period, in almost unlimited supply. The aggregate quantity received this season was not as large as that of some former years, nor was the average quality as good as usual, caused by the extreme severity of last winter, which injured many plantations, and also by the severe drouth which prevailed over a large area, at a time when moisture was most needed.

Most of the berries from south of Virginia are forwarded in refrigerators, which adds largely to their cost. The first Strawberries shipped in the ordinary way of transportation are generally received from Virginia, but this year Maryland berries were first in the market, and sold for a few days at from 25 to 30 cts. per quart wholesale. With the arrival of larger quantities prices dropped soon to the average standard of 8 to 10 cts. per quart for berries of good quality. Notwithstanding the shortness of the crop, prices ruled uniformly low, which a temporary scarcity for a day or two failed to improve.

Many fine berries are now raised on Staten Island and in Essex Co., N. J., the nearness to New York enabling the growers to bring their fruit to the market the same day it is picked, and, consequently, to receive re-

munerative prices. The crops from the Hudson River counties, although a light one—with the exception of the Catskill district—did not bring as high prices as the small supply should have led to suppose. Western N. Y. berries were of good, medium size, firm and bright, and as a whole sold better than any other.

The experiment to ship Strawberries from Tennessee to New York, in refrigerator cars, which was tried this year for the first time, did not prove a success. The transit required four days, and many of the berries presented a singular appearance upon arrival. Berries that had been bruised or otherwise injured in the picking and handling had evidently commenced and continued to decay until the intense cold in the car arrested decomposition. Thus the other part of the berry remained perfectly sound and almost completely separated from the decayed portion, but the appearance it did not improve much.

With the introduction of the Sharpless a few years ago there sprang up a sudden demand for very large berries; this season, however, a decided reaction from this preference made itself felt, and growers will find that the coming demand will be, not for monstrosities, but for medium-sized, firm, bright berries of fair quality. Extra fine quality—strange as it may appear—adds but little to the market value of a berry.

Not less than two-thirds of all the berries that came to the market were below medium, and most of them very far below, too. These have generally to be sacrificed at any price the purchaser may offer, to the serious injury of better grades.

HARDINESS OF FRUITS.

I am considerably interested in the hardness of fruits. Therefore I often ask myself by what process does a variety become hardy and how is it that we expect hardness in a variety originated north, and do not expect it in a variety originated south. I gain an insight into this subject by considering the similarity between plants and animals. Should I ask you to specify the distinctive difference between the animal and vegetable kingdoms, you would doubtless be puzzled in answering, for there are no functions of animal life differing from the functions of the plant life sufficiently to define definitely the dividing line.

The question of a digestive apparatus does not distinguish animals from plants, as some animals appear to have no digestive apparatus while plants and trees may in a certain sense be said to digest that which nourishes them; neither can the difference between animals and plants be established on the grounds that plants, vines and trees only can be propagated by cuttings, buds and scions, for there are animals that can be cut in pieces, each of which develops into a perfectly formed animal. It has been thought that the distinguishing feature is instinct. It may be that plants and trees are not possessed with instinct, but if they are not, what shall we say of the impulse that leads the vine to throw out its tendrils in the direction of a support, and twine itself about it with the greatest tenacity? Or what shall we say of the roots of a vine that pushes out a long distance in the direction of a supply of food in the shape of a manure heap, or for a

supply of water far beneath it, or to one side? Or what shall we say of a vine planted in a dark cellar which escapes from its prison and rears its head with pride into the sunshine above? If these are not evidences of instinct what shall we call them?

That plants have peculiarities similar to those of animals is apparent from the fact that there are organisms which scientific men are unable to determine whether they are plants or animals. The similarity between the habits of plants and animals teaches me that we may be aided in arriving at conclusions relating to the hardiness of fruits, by considering how animals are improved and made more hardy, also to improvement in other ways, and to treatment of diseases, as we have better physicians for animal than vegetable disorders. Therefore in answer to the question, "Where do the plants come from that are found in the north, and how came they possessed with hardiness?" I ask of whence came man and the beasts from such northern lands, and by what process did they become possessed with hardiness?

The birthplace of man and most animals was in a mild climate. Their march northward has been by slow stages, occupying many thousand years, during which they have accumulated and inherited hardiness enough to withstand the climate of the arctic regions. The birthplace of the majority of fruits was likewise in a mild climate, from whence they have migrated throughout the ages. While plants are deprived of the peculiar methods of locomotion possessed by animals, they make free use of others' wings and legs, and of lakes and streams.

The seeds of fruits will usually remain in the stomachs of birds and beasts several days and finally be deposited several hundred miles distant from their birthplace without loss of vitality. Plants have thus and by other methods migrated north and south. Those plants best adapted to a northern climate that rove south, perish under the scorching sun of the tropics, but such as migrate north become more hardy as they progress northward. The gradual increased exposure is met by the response invariably given by plants and animals when placed in a perilous position, which is to fortify themselves against disaster. Thus the parent accumulates hardiness by gradually increased exposure. The offspring inherits the hardiness of the parent and acquires more hardiness from further exposure, until in the course of ages the hardest varieties are obtained by natural processes.

This natural process is too slow for short-lived man, who seeks to hasten it by long leaps. Instead of occupying ages to remove a seedling from New Jersey to Minnesota, he transports it by express at the rate of 40 miles an hour. The change of climate is too sudden and violent, and the result is that, like many other good things, the petted variety dies young.

Man seeks with more wisdom to import a variety to our northland that through long generations of gradually increased exposure has become hardy in foreign climes. While this meets with partial success we must remember that the inherited peculiarities of member that the inherited peculiarities of such imported varieties are not such as varieties inherit on our own soil. Therefore

from our native stock must we look for our best success.—*C. A. Green before the American Pomological Society.*

FRESH FRUITS ALL THE YEAR.

People at the East know very little about the luxury of gathering fresh fruits from their own grounds every month of the year, says C. H. Lathrop in the Rural Californian, and they will hardly believe that we are able to do it even in sunny California. But let us look at the matter a moment, and see if we cannot convince the most skeptical by giving a few simple facts which can be vouched for by everybody who has spent a year or two in this favored clime.

Let us commence with January, and we find our Orange, Lemon and Lime trees, laden with their golden fruits; during February and March the same tempting fruits are abundant; and in the latter part of March and during April and May we can add the luscious Strawberry, in great profusion, to the list; in June we have Apricots and the earliest Peaches; in July and August, Apricots, Nectarines, Peaches and Blackberries; in September and October, Peaches, Pears, Apples, Plums, Almonds, Figs and Grapes; in November, Peaches, Apples, Pears, Persimmons, Olives, Grapes and English Walnuts; in December, Apples, Pears, the latest Peaches, a few Grapes; and by this time the Oranges are fit to eat again.

Other varieties of fruits might be added, but enough have been mentioned to show your readers that there is not a time during the whole year when the average Californian who has taken the pains and foresight to plant the proper varieties, cannot supply his table with the most wholesome of all human food, fresh, ripe fruits. And we can just as truly say that there is not a time during the whole year when beautiful Roses and flowers of various kinds cannot be found blooming out-of-doors and filling the air with their sweet perfume, even when the mountain tops a few miles distant are covered with their snowy mantle.

PRACTICE WITH SCIENCE.

It has been impossible until within a few years for a youth to obtain in this country any practical education in horticulture except by a sort of apprenticeship to a practical gardener. In England the Kew gardens have served as training schools for some of the best gardeners. In France the horticultural school at Versailles has turned out several generations of skilled horticulturists, and Europe has quite a number of other successful schools. Now some of our agricultural colleges have developed their horticultural departments in the direction of a practical application of the class-room teaching. On a recent visit to Amherst I was greatly pleased to note the improvements in practical horticulture at the Massachusetts Agricultural College. Prof. Maynard, short of funds for his department, was forced to enter the market as a nurseryman and fruit grower. The result has been successful in every way. It has been claimed that the College should not and need not make any attempt at commercial success. Let us see.

Prof. Maynard showed us through a four or five-acre vineyard in full bearing, where the leading varieties are grown for business; a Pear, Peach and Plum and Apple orchard

that is managed as a wise, successful fruit grower would manage it; a plantation of Raspberries and Blackberries that is made to produce a paying crop by the most approved methods; a big Strawberry field that pays, and a three or four-acre nursery that produces choice trees for sale. The greenhouses and propagating pits turn out thousands of flowering, bedding and vegetable plants that find a ready market. The students do most of the work under competent superintendence, and the lessons of a practical business success in horticulture are ever in action before their eyes, which they must learn by absorption if not from interest. And the fact is that some of the recent graduates have entered into immediate successful competition with gardeners, nurserymen and fruit growers of long experience; whereas in former years the class-room teaching and working among the scientific collections produced men who must still serve several years of apprenticeship with commercial horticulturists. Prof. Maynard's department also includes valuable collections for observation and comparison: named lots of all the small fruits, extensive beds of flowering and ornamental plants and trees, and the large greenhouse collection of choice plants. We congratulate Massachusetts on the success of this school of practical horticulture. E. H. L.

A Cherry tree at Chico, Cal., is said to have yielded 1700 pounds of fruit.

The Kieffer Pear does not sustain its reputation for freedom from blight.

It is said that the grasshopper has proportionally 120 times the kicking power of a man. A poor young grasshopper never goes to see a rich Miss Grasshopper when old man Grasshopper objects.

Thirty-five pounds whale-oil soap and four gallons coal-oil to one hundred gallons of water is recommended by the California Horticultural Commission as the most effective insecticide.

Cousul Griffin says in his report that the demand for American fruits in Australasia has increased to such an extent within the last few years that it is now very much in excess of the supply.

Irrigation can never take the place of cultivation, and western fruit growers are rapidly finding out that to make fruit growing profitable their land needs more cultivation and irrigation.

"Sam, you are not honest. Why did you put all the good Peaches on the top of the measure, and the little ones below?" "Same reason, sah; dat unakes de froot of your house marble and de back gate chiefly slop bar'l, sah."

The Charles Downing is the most popular Strawberry in the Boston Market, said a prominent dealer. It is of fine quality, desirable size, good color and a fair keeper. For all purposes it seems to best suit the popular demand.

Flowers.

SUMMER FRIENDS.

Written for The American Garden.

BY E. A. MATTERS.

The birds have gone, all gone away,
And never said "good bye;"
It makes me feel so sad to-day
That I could almost cry.

When did they go, at morn or night?
And were they all together?
The wren, and robin, bluebirds bright,
And birds of every feather?

Is there some sign the birds all know,
A blossom or a star,
That warns them of the coming snow,
And bids them fly afar?

Oh, Mamma! will they come again,
The very same next year?
"Aye, they will come, in spring's glad train
You'll find them all, my dear.

"There's not a sparrow of the band
Unmarked by God may fall.
Within the hollow of his hand
He holds them, great and small."

OCTOBER IN THE FLOWER GARDEN.

In all horticultural pursuits we have to live in some degree in the future; to-day we have to plant for pleasures to be enjoyed six months hence. The beautiful beds of flowers now soon passing away, had to be arranged and planted last spring. So it is all through the year, the work done is for future enjoyments.

HERBACEOUS PLANTS.

Gather all seeds of deserving herbaceous plants, such as Campanulas, Foxgloves, Poppies, Delphiniums, etc., and sow immediately in some well-drained, well-manured border or bed. More and more every year are these hardy perennial and biennial plants being cultivated. In the neighborhood of Boston—that center of Aesthetic Gardening—this summer I saw some of the finest displays of herbaceous plants I ever had the good fortune to behold anywhere.

I do not advise the planting of herbaceous plants in beds where a constant glare of color in flower and foliage is wanted during the summer, but everyone should have a bed or border for just such plants as are hardy, and give a plentiful supply of flowers during their season.

By judicious care in selecting successive kinds, some may be had in blossom from the time the beautiful Snowdrop, *Galanthus nivalis*, and many-colored Crocuses appear on the first approach of spring, until November frosts have nipped the last Phlox and Aster.

CAMPANELAS.

Some kinds of Campanula growing in the Botanic Gardens, Cambridge, and also in the private garden of Miss Dore, Andover, Mass., were most beautiful objects, rivalling even the Gloxinia in color and beauty of form. Mr. Weston, the gardener, says they are of the easiest culture and for some kinds of floral work are remarkably well adapted, enduring for a long time after being cut and producing their flowers in the greatest abundance. By sowing the seeds early in the fall they form large, strong plants for next summer's blooming.

LILIES.

Often the question is asked, "Why is it my Lilies flower so sparingly after being transplanted in a well-manured and otherwise well-cared-for bed in the fall?"

Just because they were not planted early enough in the fall! All Lilies that make an autumn growth should be planted not later than the first of October in order that they get sufficient time before the ground freezes to make their necessary amount of growth. This is especially applicable to *Lilium candidum*.

The soil best adapted for Lilies of all kinds is a good, friable loam, having thoroughly incorporated with it a good quantity of rich, decomposed cow-manure. See that it is well rotted, as nothing is more injurious to bulbs than fresh manure of any kind coming in contact with them. Also perfect drainage is necessary for their successful growth. When too much water remains in the soil, decay of the bulbs is the result.

Plant the bulbs about six inches deep and have the surface of the bed so rounded that no surface water can remain upon it. Before hard frosts are felt give the bed a good covering with manure or leaves; this greatly helps in making them start stronger in the spring and produce flowers more profusely.

SPRING FLOWERS.

For early spring-flowering sow seeds of *Phlox Drummondii*, Pansy, Double Daisy and Forget-me-not. Sow in a sheltered spot where they can be watered and shaded until large enough to have a good start. The smallness of the seeds of the Daisy and Forget-me-not requires to have the soil raked very fine and then sown on the surface and but slightly covered. Sow thin enough to allow the plants room to get a good size before frost sets in.

It is the better way to let them remain in the seed bed over winter; then just as soon as the frost gets out of the ground, plant where they are to flower, giving good, rich soil and a dry position.

They all require winter protection of some kind which has to be put on with caution. With too much of it, or if it lie too close on the plants, they are apt to be smothered. Have some material which shall shelter them from the cold winds and the direct rays of the sun, but sufficiently porous to allow a free circulation of air around the plants.

DAHLIAS.

Examine all the Dahlias and see that each plant is properly labelled. Nothing is more annoying than when spring comes, and time for propagation arrives, to find the Dahlias all mixed up without a label to designate one kind from another. **

THE AGERATUM.

The Ageratum is a Mexican flower. It is not a showy plant, but it is a very beautiful one, for all that, and any lover of real beauty will prize it much more than he will many of the more brilliant garden favorites. The flowers are made up of fine, thread-like petals, which gives it a brush-like appearance. They are borne in compact clusters, and are very freely produced all through the season. It is much used by florists in cut-flower work, and in the garden it is one of our best plants for use as a border for beds, especially the dwarf varieties.

A. Mexicanum, the best known variety, is a rich blue in color. It grows to the height of a foot, and branches freely.

Tom Thomb is of a lighter blue, so much so as to be almost a lavender. This com-

paet, dwarf-growing kind, producing its flowers on short stems, is the best kind to use for edging beds, the best, indeed, for any use, except where the plant is grown exclusively for bouquet work. It makes a most charming house-plant if care is taken to keep off the red spider. To prevent this, the foliage must be sprinkled, or syringed, daily. As the foliage forms a dense mass, completely covering the surface of the soil in the pot, an ordinary sprinkling will not answer, and I find the most effective way to get plenty of moisture to the under side of leaves, where it is most needed, is to dip the plant in a pail of water. Then you are sure to get to the spider's lurking places, and he will soon vacate them, if this treatment is kept up. Unless you do this, your plants will soon be ruined.

On account of its soft, rich color,—one seldom met with among flowers,—it is very useful for bouquets. The delicate shades combine and harmonize delightfully with almost all other colors, forming a fine contrast, and thus heightening the effect.

A. Sasseaurii is pink, a compact grower, and a good bloomer, but hardly as fine as the two other varieties named.

It is a good plan to start the seed in the house, quite early in the season. For ribbon-gardening, where stripes or masses of solid color are desirable, it is one of the best annual flowers we have. E. E. REXFORD.

FAILURES WITH LILY OF THE VALLEY.

A frequent cause of failure with this charming plant is that the roots are planted too deep. The crowns should be just level with or but very little below the surface of the ground. Another cause of failure is having them too crowded, in which case leaf growth takes the place of flowers. Transplanting or thinning out is the remedy in the latter case. A liberal dressing of yard manure in the fall does them a world of good. It grows almost anywhere in the shade, but usually does not flower till it has become well established. It spreads rapidly, and the roots love to be let alone.

MILLA BIFLORA.

In all descriptions of this beautiful Mexican bulbous plant we have seen, it is stated that "the flowers are in pairs," as also the botanical name would indicate. This is evidently a misnomer, as among many hundreds of plants we have seen this summer, the majority of flower-stalks had more than two, many from five to seven blossoms. This does fortunately not detract from its beauty. It is a charming plant, with pure white flowers of delicate fragrance, and slender, rush-like leaves. The bulbs have to be planted in spring, taken up in autumn before heavy frosts occur, and generally treated similar to Tigridias. When better known this plant will, no doubt, enjoy great popularity.

Tigridias, Tuberoses, Colocasias and all tender bulbs have to be taken up after the first frost. They have to be thoroughly dried and stored in a place not below 40°.

Lily stems, after the flowers have faded, do not present a very attractive appearance, nevertheless they should not be cut off until they are entirely dry, as the foliage assists the bulb in perfecting its maturity.

OUR NATIVE GOODYERAS.

Goodyera pubescens and *G. repens*, popularly known as Rattlesnake Plantain, are the Orchidaceous plants. They differ but little from each other, and intermediate forms between the two occur, so that some botanists consider them only varieties of one species. Both are found throughout damp, shady woods of the Northern States, where their beautiful, blue-green, velvety leaves, veined with silken threads, attract frequent attention. The flowers are small, greenish white, and borne on a one-sided scape varying from six to twelve inches in height; roots thick and fibrous, attached to a somewhat fleshy, creeping rootstock. On account of their strikingly showy leaves the plants are great favorites for florists for hanging-baskets and rockeries. For the accompanying illustration, from Henry Baldwin's Orchids of New England, we are indebted to the publishers, John Wiley & Sons, New York.

LILIES.

Lilies are among the oldest inmates of the garden, and our love and admiration are pretty equally divided between them, the Rose, and the Carnation. Our love for other flowers is often fluctuating, but for this triad it is constant and enduring. It is not their beauty alone which fascinates us, but an added and characteristic fragrance, which always holds a place of its own in the memory.

The Lily, it is sometimes said, is easily grown; and this is true when it is placed under proper conditions. These conditions, unhappily, are not always met, and failure is the result. All kinds of Lilies will not grow equally well in the same soil or bed. An intelligent and successful amateur friend, suffering from a craze for Lilies, told me he had spent upwards of a hundred dollars in trying to establish a large bed. He had bought everything advertised, and put them all in a bed made excessively rich with half-rotted manure. More than fifty per cent died. Grouping the kinds in three small beds with different soils, he was more successful.

Lilium candidum, the common White Lily, also called Easter Lily, will grow and flower well in any good garden soil. In the end of a bed, composed of about eighty per cent of sand and twenty per cent leaf mould, they live and grow, and at intervals of a couple of years produce a flower or two about the size of a Daisy. On the contrary, in the same place *L. superbum*, a beautiful native Lily, flowers very well, but does much better in a better soil. *L. candidum* has been much used for forcing for Easter flowers, but is now mostly superseded by *L. longiflorum*.

L. Thunbergianum and its varieties do best in a heavy loam, with leaf mould added. It is not generally known that this Lily is a native of Japan. *L. speciosum* and its varieties, commonly called Japan Lilies, and the most beautiful of all Lilies, I find do best in a light loam rich in vegetable matter. *L. auratum*, the Golden-banded Lily, and the

most deliciously fragrant of all, does well under the same conditions, but seems to crave shade more than most others.

L. longiflorum, with a long list of aliases as well as long flowers, is generally supposed not to be hardy, probably because it is so largely grown under glass for winter forcing; but this is a mistake, so far, at least, as the latitude of New York is concerned. I have grown it in the open air for more than thirty years, and have never known it to be winter-killed. It will do best in a rich loam, but flowers well in the ordinary soil of the garden. *L. Harrisii* or *L. floribundum* is a varietal form of *L. longiflorum*, but is much to be preferred to the old form, being larger and more prolific, and repeats itself two or three times at that.

all good, reasonable in price, and quite enough for a beginning. I must mention, however, the California Lilies, such as *L. Californicum*, *L. Washingtonianum*, *L. Humboldtii*, *L. pardalinum*, *L. Parryi*, all of which are very handsome, and some of which require peculiar treatment. I find they do best in a sandy loam rich in vegetable matter, but without manure, unless it be old and thoroughly rotted. The soil may be enriched with manure after the bulbs have become established, and this is a good plan for all Lilies. I have known *L. Washingtonianum*, when planted in the spring, to remain dormant till the following spring, when it has started strongly.

A bed of Lilies is a very pretty sight, but I would advise the novice to grow his Lilies in the garden border, where he will be more likely to meet with success than in a bed. Planted among the small shrubs and herbaceous plants, they will get at the roots all the shade they need, and produce some charming effects in color and form. Lilies should be staked, and the stakes should be put in the ground when the bulbs are planted, and not afterward. They may be planted in the fall or in the spring; but if in the fall, it is just as well to throw a little coarse litter over them for the first winter. When doing the annual digging in the border, do not stir the soil around the Lilies more than two inches in depth. The bulbs should not be disturbed or divided more than once in four or five years.

If you can grow only a few kinds, begin with *L. speciosum* and its varieties, *L. longiflorum*, *L. candidum*, *L. tigrinum*, *L. superbum*, *L. bulbiferum*, and *L. auratum*; and if you do not succeed with the last on the first trial, keep on trying till you find some home-grown bulbs that will give you great golden-banded flowers that fill the air with the most grateful fragrance of the whole Lily family. P. B. MEAD.

OUR FLOWER BASKET.

Forest leaves held down with branches of evergreen trees make as good a covering as any for all kinds of plants. Now is the time to get them.

The watering-place and sea-shore season this year has been a remarkable one for the extent and amount of floral decorations used.

There is no more favorable season in the year for laying out new flower-beds, walks, and garden improvements in general than the late autumn months.

Gladioluses bear considerable frost, if they are planted deep, yet it is not prudent to run too much risk. They may be wintered in any dry, frost-proof place.

Chrysanthemums may be lifted and removed to their blooming quarters, or to replace summer bedding plants, or to nooks where they can be protected from frost, rain and wind by sheeting or matting. In this way their flowers may be preserved till the end of November.

GOODYERA PUBESCENS.....G. REPENS.

L. longiflorum is also known as Easter Lily, Bermuda Easter Lily, Trumpet Lily, and by other names.

The beautiful little *L. tenuifolium* deserves a place in the border, where it will produce its tiny recurved flowers in the greatest abundance. *L. excelsum*, a tall-growing plant, dance. *L. excelsum*, a tall-growing plant, bearing nankeen yellow flowers, is also easily grown in any good garden soil, but is impatient of much moisture at the root. *L. tigrinum* is an old favorite, common to almost every garden, and blooms freely in any ordinary border. The double form is very desirable, and is just as easily grown as the single, while the flower lasts much longer.

There are many other beautiful Lilies, more or less expensive; but the above are

The Window Garden AND GREENHOUSE.

THE WINDOW GARDEN FOR OCTOBER.

Brackets and shelves should be properly fixed and in place, and plant stands painted or cleaned or held in readiness for use. Growing plants should be thoroughly cleansed from insects, and those that need it, staked and securely but loosely tied, and the pots they are growing in washed clean.

Lift and pot as soon as possible all plants required for winter decoration; we should endeavor to have them well-rooted in their pots before introducing them to our windows. Such plants as old Geraniums, Fuchsias and the like, that we merely wish to keep over winter for next summer's garden, we may allow to remain undisturbed till there is danger from frost, then lift, cut them well back, and pot them in small pots or put them thickly into boxes. But remember, frost does not benefit window plants, therefore we should guard them against a temperature under 40°; at the same time, so long as we can safely shelter them out-of-doors, in a cold-frame, or on the piazza, they are better there than coddled up inside of windows. I can do no better than tell you what I am doing with my own plants.

SWEET ALYSSUM.

Some plants of the doubled flowered in four or five-inch pots, still outside, will bloom all winter long.

ANARYLLISES

Were plunged outside all summer and have grown rankly. I shall soon bring them in doors and dry them off gradually, not wholly, to start in January to March for early flowers.

GALLAS.

I have lifted and repotted these in very open, turfy, rich soil; they are now standing in a warm, sheltered place outside. Water lightly at first.

EPHYLLUMS AND CACTISES

Of all sorts are under cover, as wet rusts or rots them. The piazza is a good place for them a week or two.

PARIS DAISES

Are still plunged out-of-doors and shall remain there for some weeks. I prefer throwing a sheet over them to protect them from slight frost, to taking them in-doors before November.

POINSETTIAS

Are also under cover. A warm, sunny spot on the piazza is a good place for them. Cold, and cold rains defoliate the plants and rot the roots; and without leaves or roots you cannot reasonably expect "flowers."

HELIOTROPES

For winter flowers are established in six-inch pots. It is no use depending on plants lifted now; they take so long to recover from the shock of moving.

VIOLETS.

These have been planted in frames and for a few days a lattice-shading placed over them. I will not cover them with sashes at any time except to protect them from sharp

frost. Our out-door bed was planted so thickly that I shall leave and cover it up without disturbing the plants. I expect a good crop from it in spring.

CALCEOLARIAS, CINERARIAS, CYCLAMENS AND CHINESE PRIMROSES

Are in two-and-a-half to five-inch pots and in cold-frames, where I can keep them cool, moist, slightly shaded from sunshine, and in vigorous growth.

FUCHSIA SPECIOSA

Is started and ready for winter. The others were planted out, and are now cut back, lifted and potted into as small pots as I could get their roots.

GERANIUMS.

Scarlet Geraniums, established in five and six-inch pots, are now stocky plants full of flower-buds; they are still plunged outside, but I shall soon bring them into a frame where I can cover them at night and from

STAPELIA LENTIGINOSA.

rain. Lady Washington Geraniums were planted out in summer and are now cut back, lifted and potted and standing outside till they begin to start a little. The prunings are used as cuttings, as my best blooming plants are usually only six to nine months old when in their prime.

GLOXINIAS

In frames are about past. In a few days I shall cut them over, lift the "roots" and lay them one-deep and thickly in flats, which shall be kept inside and perfectly dry, and in a minimum temperature of 50°-55°. Pot-grown plants are still in their pots and quite dry.

BEGONIAS

I have in a cold-frame, and some in-doors, for wet as well as cold hurts them. The Rex sorts I shall keep a little dry to discourage growth, but the *rubra*, *odorata*, *fuchsioides* and others of that class, I encourage to grow and bloom in their own beautiful way.

HYACINTHS

And other Dutch Bulbs for winter flowers are potted, and placed thickly together out-of-doors under a bed of coal-ashes.

HYDRANGEAS

In pots shall be kept outside till defoliated, then placed in a cold-pit, there to remain till later on for forcing.

LIBONIAS

Are stocky plants in five and six-inch pots, now set in an uncovered frame. They were planted out during summer.

OUR FERNS

Have been cut so much all summer long that I cannot afford to let them all go to rest now. I am repotting the most vigorous ones, also the young stock; these will keep growing all winter long. Of course we only treat the evergreen sorts in this way. Some are outside, some inside, but it is now time that all of them were in-doors for the winter.

METEOR MARIGOLDS

Are in 5 and 6-inch pots, established, and full of buds. They will remain plunged outside till the end of the month. Slight frost won't hurt them.

MIGNONETTE

In pots and boxes and frames are in various stages of growth from germinating to blooming. Keep outside and exposed for nearly a month yet. Mile's Hybrid Spiral is excellent for winter use, being of a neat habit.

ROSES.

The Teas and Hybrids that were planted out have been lifted, potted, stood aside in a sheltered place, and well watered to get them well rooted before winter sets in.

STEVIAS

Are still plunged outside. They have been staked and repeatedly pinched. We feed them liberally with manure water.

STOCKS AND WALLFLOWERS

Are in four to six-inch pots and plunged outside. Those for flowering in pots shall be shifted again; those for out-door spring-blooming shall be turned out of their pots and planted thickly in a cold-frame. We will not cover them till November.

STREPTOSOLEN JAMESONI

Has made stout, fine plants. Each plant is tied to a stout stake. It needs lots of water and I give it weak manure water. It blooms in February till May.

CARNATIONS.

Most of these have been lifted, potted, staked, and placed in a warm sheltering place and freely watered; there they will make good roots before being brought in-doors. I don't like housing them before the end of this or beginning of next month. I am rooting a lot of cuttings now. These I shall keep over in a cold-frame, and plant out in spring for summer flowers.

SMILAX

Was rested a little in summer and is now cut over and some of it starting afresh. It now needs moisture and warmth to push it, but if we are not in a hurry about it, it will come along slowly for awhile, but fast enough after a month or two. It likes plenty of water and a good shower-bath.

WM. FALCONER.

THE CARRION FLOWER.

Stapelia.

In general appearance these odd-looking plants resemble some species of Cactus, but in their botanical position they have no relationship with them, and belong to the *Asclepiadaceæ* or Milk-weeds. All the species of *Stapelia* are natives of the Cape of Good Hope from whence they have been introduced since 1710.

The entire plant is very succulent, and requires treatment similar to Cactaceous or Crassulaceous plants. While growing vigorously they should be watered copiously, but at other seasons frequent watering will surely cause rot. They are propagated by cuttings placed in dry sand.

The flowers are interesting and showy. The bulbs are of a roundish shape, and starting in most species from the base of the plant; they are star-like in shape, and of a peculiar brownish or yellowish color not frequent in other flowers; they smell very much like carrion so that flies are attracted and will sometimes lay their eggs upon them.

THE JACOBÆAN LILY.

Sprekelia formosissima.

The scarlet Jacobæan Lily, or as it is termed in some catalogues, *Amaryllis formosissima*, is a very beautiful bulbous plant belonging to the Natural Order Amaryllidaceæ. It is a native of South America, from whence it was introduced in 1658, and it is to be regretted that it is so seldom seen in cultivation at the present day. The bright green leaves are about half an inch wide, from 10 to 12 inches long, and the brilliant, scarlet, velvety flowers are produced on single flowered scapes from nine inches to one foot in height. Each bulb generally produces two stems one after the other, each stem being surmounted by a single flower, nodding on one side, thus presenting a very graceful appearance. The flower is composed of six petals, three hanging down and three being erect and recurved. The time of flowering depends upon the manner in which the plants are grown.

As generally cultivated the *Sprekelia* flowers in June or July; the bulbs being planted in the open ground early in May. The border should be well enriched and the bulbs placed about six inches apart. The bulbs ripen off by fall when they can be taken up, dried, packed in sand, and stored in a dry, frost-proof cellar until they are wanted for planting again. To cultivating the plant in this manner there are these objections, that blooming at a season when there are so many other flowers, their superb beauty is too little appreciated, then again storms and changes of the weather soon destroy the flowers, so that I think on the whole it is far better to have them bloom during the winter and early spring months.

This can be accomplished by potting the bulbs about the middle of October and then placing them in a cool, dark cellar until it is desired to start them into growth. A four-

inch pot will answer for a single bulb and if larger pots or pans are used two or more bulbs can be placed in them. Care should also be taken to drain the pots well and to use a compost composed of two-thirds light, loamy soil and one-third well-decayed manure.

During their seasons of growth water should be freely given and after flowering it should be gradually withheld. When all the foliage has decayed, turn the plants out of the pots and treat the bulbs as advised for outside grown plants. A light, sunny situation, with an average temperature of 58°, is the most suitable for the successful cultivation of this beautiful bulbous plant, whether grown in the greenhouse or window garden, for either of which it is equally adapted.

STAPELIA ASTERIEÆ.

The popular name Jacobæan Lily has been given on account of the brilliant scarlet color of its flowers, which the Spaniards in Peru thought resembled the scarlet swords worn by the Knights of the order of St. James (Jacobæus). The generic name *Sprekelia* (Jacobæus). The generic name *Sprekelia* was given in honor of Dr. Sprekel, a German botanist.

CHAS. E. PARNELL.

STEAMER FLOWERS.

A horticulturist who recently made the trip from here to Liverpool, writes that in a mixed bouquet comprising choice varieties of Roses, Geraniums, and many well-selected blossoms, the Chrysanthemums, Daisies, Pyrethrums, and other flowers belonging to the order *Compositæ*, kept the entire voyage of eight days, almost as fresh

as when first cut from the plants, while the Roses and nearly all other kinds withered. This information should be noted by those who wish to send European friends American flowers.

The floral souvenirs carried away by the steamers have been very handsome this summer. Large satin boots of different colors with a cord and tassel at the ankle to tie the flowers, have been fashionable for bouquet-holders. Convenient cases for toilet articles to be used in the cabin have been filled for parting gifts with blossoms. What is known as a "Steamer bag," containing many pockets, was beautifully arranged with Corn flowers, for a farewell present.

OUR WINDOW BOX.

Always give ventilation at the top of windows, not at the bottom.

Geraniums, Fred Dorner and Freddie Heinel are by some of our readers considered the best "perpetual blooming" varieties.

Cork dust, such in which Spanish Grapes are packed, has been recommended for drainage of flower-pots, as retaining a more uniform moisture, and lessening the weight of the pots.

Cleanliness cannot be too scrupulously observed with house plants. Thick-leaved plants should be washed with tepid water and a sponge, and others sprayed whenever practicable.

One of the old, exploded notions is that plants in living-rooms are unhealthy. Strong-scented flowers may be so, but a single lamp burning in a sleeping-room vitates the air more than a window full of plants.

It is not worth the trouble to dig up old plants that have bloomed all summer, and pot them in the expectation of having them bloom all winter too. Young, thrifty plants are best for winter-blooming.

Dielytra or Bleeding Heart is an excellent plant for winter-forcing. Small clumps should be taken up after frost, potted, and kept in a cool place until they show signs of growth, when they may be removed to a warmer position. When growing they require an abundance of water.

Palms, Dracænas, Pandanus, Nepenthes, Agaves, Ferns and similar plants are largely used in house decorations now, and some florists make a specialty of renting such plants for an evening, or day, or any time desired. Sometimes the plants are insured against fire, just like furniture.

A plant, or a stand of flowers, says E. S. Rand, is a constant source of pleasure in a room; it is a spring of sunshine, and its silent influence makes all the household more cheerful and better. We would have flowers in every house, for their sunny light, for their cheerful teaching, for their insensibly ennobling influence.

Exhibitions & Societies.

AMERICAN POMOLOGICAL SOCIETY.

Editorial Correspondence of The American Garden.

One of the most interesting and valuable meetings in the history of the Society was that held in Grand Rapids from September 9th to 11th. No more appropriate place as to location could have been selected, and certainly none where the residents were more in accord with the cause of the Society, and more anxious to make the stay of the members and delegates as pleasant and agreeable as lay within their power. The Universalist Church, where the meetings were held, is a large, commodious building, situated on a quiet street, and was excellently adapted for the purpose; a large floral monogram of the Society's initial letters, arranged against the organ in the front center, and some large, beautifully arranged varieties of flowers offered a bright greeting of welcome.

The exhibition of fruits was in a large, tastefully decorated hall, a few blocks distant. The Michigan exhibit was by far the largest, comprising about 1000 plates of fruits, and representing every section of the State. Ohio and Missouri had the next largest. The collection of 140 varieties of Pears from Ellwanger & Barry, Rochester, N. Y.; 100 varieties of Pears from President Wilder, Boston; 61 varieties of Pears from B. G. Smith, Cambridge, Mass.; 28 varieties Crab Apples from P. M. Gideon, Excelsior, Minn., and the exhibit of Cocoanuts grown in Florida by Field & Osborn were especially meritorious and were awarded Silver Wilder Medals. The number of new and promising new fruits was very large. One of the most interesting exhibits, collected by Prof. L. H. Bailey of the Michigan Agricultural College, consisted of some seventy-five kinds of berries, nuts and other native fruits, some of which are probably adapted to improvement, and may in time find their places among our cultivated fruits.

The announcement of President Wilder's inability to be present was a great disappointment to the members, and 1st Vice-President P. J. Berckmans being also obliged to be absent on account of illness, Patrick Barry of Rochester, N. Y., was unanimously chosen chairman. Addresses of welcome were delivered by T. T. Lyon, president of the Michigan Horticultural Society, for his society, Mayor J. L. Curtiss for the city of Grand Rapids, and President Angell of the University for the State: for all of which President Barry, in his usual graceful and felicitous manner, returned the thanks of the Society. The appointment of the various committees, and other routine work followed, after which President Wilder's invitation to meet in 1887 in Boston was accepted by a unanimous rising vote. The following officers were then elected: President, Hon. Marshall P. Wilder; First Vice-President, Patrick Barry; Treasurer, Benj. G. Smith; Secretary, Chas. W. Garfield; and a Vice-President for each State.

President Wilder's address was then read by Prof. Beal. It is a beautifully written, clear account of what the Society has already accomplished, and what is its future mis-

sion; we only regret that our limited space does not permit our publishing it in full.

"When we reflect on the unsettled and chaotic condition of pomology in our country when our Society was established, the narrow limits to which fruit culture was confined, and the few engaged in it, and compare it with the immense territory now occupied for this purpose, and its importance as a great industry of our country," says the President, "I think it may be well to take a retrospective view and see what our Society has accomplished.

"Its formation opened a new era of enterprise in the annals of American Pomology, which has no parallel in those of other lands. It was the first great national pomological society, embracing in its organization the largest arena for fruit culture in the world, where almost every fruit of every zone may be grown in perfection.

"It has brought into close communion of interest, and concert of action, the most experienced and skillful pomologists of our country; and by its proceedings and publications has furnished examples and methods of work which have been adopted by other pomological and horticultural societies, all working harmoniously together, and thus has become the acknowledged authority of our land.

"It is truly an AMERICAN Society, having, through all the vicissitudes of the past, held in the bonds of friendly intercourse for the promotion of our cause, the North, East, West and the South, and every region where fruits can be grown on this continent.

"It has raised the standard of excellence by which our fruits are judged, discouraged the cultivation of inferior sorts, and thus educated the taste of the public for those of better quality, so that kinds once common in our markets have become obsolete, and are now considered unworthy of propagation. In doing this portion of its work it has discarded by general consent more than 600 varieties, either worthless or superseded by better sorts.

"It has established a uniform system of rules, by which fruits are to be shown and judged. But, what is of the highest importance, it has instituted a much-needed reform in the nomenclature of fruits, by which all long, unpronounceable, indelicate, inappropriate, and superfluous words are to be suppressed in the dedication of our fruits.

"One of the grandest achievements of the Society is its Catalogue of Fruits, published biennially, with isothermal divisions and columns for fifty States, Territories, and districts, in which are recorded the fruits which may successfully be grown in those divisions, with stars to designate the merits and seasons of each. This is a work of great merit, and not attempted by any other society.

"Few things in the history and progress of American Pomology have been more effective in the past and more promising of valuable results in the future than our system of State Reports. They embrace correct information from trustworthy persons, having special reference to the varieties most successfully grown; new kinds worthy of special notice; the chief obstacles to successful fruit culture in each district; and correct information in regard to the extent and progress of fruit culture in each section of our

country, and are published under the supervision of the chairman of the General Fruit Committee of our Society, and contain a vast fund of information not elsewhere to be found.

"These reports constitute a mine of pomological wealth, and contain not only all the modifications and changes which may have been made in collecting information concerning the culture of fruits, but also in the naming of them, and the synonymes by which they are known; the most desirable varieties being designated in our catalogue by stars, according to their several merits. Had it done nothing else, this alone would entitle our Society to the universal approval which it now receives, and the gratitude of the generations which are to succeed us.

"Before the organization of the Society, while we had around us an immense region ready for the cultivation of the finest fruits, great profusion prevailed in nomenclature, and the difference between good and bad sorts was very dimly appreciated. At that time, pomologists experienced great difficulty in obtaining varieties true to name; and sometimes, after repeatedly procuring fruits, and losing years in waiting for them to bear, found themselves where they started. The American Pomological Society has performed an immense labor through its meetings and its committees, in correcting this confusion, and it is wonderful to contrast the early condition of pomology with its present mature state. Its future labor will be continuous and of vital moment, in introducing new and valuable varieties; and what will be of the greatest importance, maintaining an accurate nomenclature. It will inform fruit-growers, in every State and Territory, what fruits they are to look to for successful culture. But most important of all, its business will be to give American Pomology a high character as a science; to prevent the appearance of mere money-making and petty attempts to impart undue prominence to new favorites by laudatory names. The continued aim of the Society will be to maintain a position of dignity, integrity, and impartial usefulness.

"To record all the good the American Pomological Society has accomplished would be equivalent to writing the history of American Pomology during the period of the Society's existence. Its PROCEEDINGS are not only a record of the events of the time, but they clearly show that the Society has been preëminently instrumental in shaping and directing the pomological destinies of our continent. It has organized and systematized everything pertaining to fruit culture, and has developed and elevated American Pomology. The Fruit Catalogue is a grand and glorious work, but far greater is the educational and refining influence which the Society exerts over its members. No one, unless he be irredeemably depraved, could attend its meetings without becoming not only a better pomologist, but also a better man and Christian.

"The work which our Society assumed was immense. It required a great society to carry it on. A great amount of time, labor, and treasure has been expended in bringing it to its present flourishing condition; but however great the labors performed, and the sacrifices made in behalf of our Society, not

one regrets them, but all rejoice that they have had a share in promoting a work so beneficent in its design, and in perpetuating it for the comfort and happiness of mankind.

"That the Society's mission for the future will be not less beneficial is hardly to be doubted, built upon so solid a foundation as it is. It will continue and complete the reform in nomenclature just commenced. As the laws that govern cross-fertilization become better and better understood, it is not improbable that the most desirable types and strains of fruits will become more firmly established, resulting in the diminution of the number of varieties, and the perpetuation of only those best adapted to our various climates and soils. The special aim of the Society should be to enlist in its active membership all the best elements of our country, and to form, as far as possible, a closer relation with all existing State Pomological or Fruit Growers' Societies."

[TO BE CONTINUED.]

SOCIETY OF AMERICAN FLORISTS.

THE MEAT OF THE MEETING.

Special Correspondence of *The American Garden*.

(CONTINUED FROM SEPTEMBER ISSUE.)

A committee was instructed to draft resolutions in regard to the more careful handling of flowers by express companies. In a paper on THE PROPAGATION OF TEA ROSES,

Their treatment, and originating new varieties, Jno. May of Summit, N. J., said that the Teas were not only the most favored, but commercially the most valued of all Roses. To propagate them, take thrifty cuttings in January, cutting just below a bud; give a moderate, steady bottom heat, and keep them shaded from a hot sun. When rooted, pot off in two-and-a-half-inch pots in a compost of two parts decayed cow manure to three of rotted turf, and shade from the hot sun for a day or two. Give a night temperature of 50° to 55°; water sparingly and syringe every other day. In six weeks repot into four or five-inch pots, being sure to have the ball of earth thoroughly moistened through, but wet enough to be muddy. When the roots have filled the pots, shift into seven-inch pots and then into larger ones as necessary.

Near the close of summer prepare benches; cover with thin sods, grass down, and fill in with eight or nine inches of compost. Set the plants in this 15 to 18 inches apart; water as needed and when the night temperature falls below 56°, cease syringing late in the day. About Oct. 1 mulch with two parts of cow manure to one of rotten turf, one and one-half inches thick, and as the season advances, water with liquid manure made of one peck cow manure to fifty gallons of water. Hen manure may also be used, in which case one-third less will make a solution of sufficient strength. For mealy bugs and red spiders, paint the heating pipes with sour milk and sulphur. Rose houses should have movable roofs, to be taken off in summer. In September let the beds get dry and do not apply heat until thoroughly frozen. Then cut out dead and immature wood and mulch with cow manure. As soon as the frost is out, water thoroughly and gradually increase the heat.

To originate new Roses, select parents that possess desirable qualities. Bon Silene

is a good example of what such qualities should be. Remove stamens from the mother flowers and fertilize by hand. If the operation is successful let the seed pods remain until thoroughly ripe or yellow. Gather in October and pack in sand until January, when the seed may be sown. The chances for success are many blanks to one prize. Our climate is favorable, however, and perseverance will sooner or later be rewarded. There is no reason why we should go to Europe for our new Roses. If you ask, What would be desirable in a new Rose? I may answer: A bright scarlet, the color of the General Grant Geranium.

Robt. Craig, of Philadelphia, said the cause of disease in Roses deserves careful investigation, but as newly imported Roses are healthy for a year or two, this seems to point to a way out of our difficulty. If we import our plants we are always sure to have them healthy. Our hot summers do not give the Rose a chance to rest, and thus its constitution is weakened.

John Henderson of Flushing, L. I., thinks Roses are more healthy when grown in beds than on benches.

I. H. Taylor of New York, considered pit-grown Roses more healthy, but they refuse to bloom in January and February when flowers are most desirable. He prefers the benches, and has run one house continuously with success.

Secretary E. G. Hill, Richmond, Ind., has imported many Roses, but in thus escaping one disease has got another. He has been successful with benches having plenty of space (three-quarters of an inch) between the bottom boards.

Jas. Hendricks, Albany, N. Y., prefers pits. He has tried benches and failed. He nearly lost all his plants in one house last winter from a new fungoid disease that baffled every remedy tried.

C. L. Allen thinks that plants like animals have certain limitations. The faster the pace the sooner the end. If we force production under unnatural conditions we can only expect disease and speedy death. There are in the world about 142,000 known species of plants, each filling its appropriate place, and consuming its peculiar food. When that food is exhausted there is no farther place in the economy of nature for that plant, and it perishes.

If this theory is true, then it explains why we must constantly renew our old collections with new plants containing different combinations. The originator of such a Rose as "Her Majesty"—measuring nearly seven inches in diameter—has not lived in vain.

Mr. Jordan said the West has long, hot, dry summers and sudden winter changes that make plant-growing a different business that make respects from that at the East. Up in some respects from that at the East. Up to this time plant literature has been written and talked only from Eastern experience. The production of Roses during summer is a matter of importance, as the demand then is rapidly increasing, and florists will be obliged to meet it.

WHAT SHALL WE GROW FOR EARLY SPRING AND SUMMER CUT FLOWERS?

A paper by Henry Michel of St. Louis, was read by Mr. Armstrong of the same city. Mr. Michel has been long in the florists' business, in which he is considered successful, but he

signally failed in telling what florists so much wish to know, i. e., something new about flowers for May and June. He lengthened the list until it included everything from the Crocus to the latest Chrysanthemum, without giving any really new information, except the fact that a new, single Tuberosa had originated in his grounds that was liable to throw up three or four flower stems from a single bulb and prove an acquisition on account of being two weeks earlier than the common kind.

President Thorpe read the following list from his note book: *Anemone Japonica* and *alba*, where they succeed; *Helleborus multiflorus*, var. *filipendula plena*; *Müller's Tritoma*, a Mexican plant that in its native state only throws up two flower stems, but in this country under good cultivation it will send up seven; *Lychnis coronata alba*; *Spiraea filipendula flore plena*, not entirely hardy at New York; *Asparagus tenuissimus*, the new bouquet queen plant which fills a long-felt want and has come to stay.

Mr. Hamilton considered the *Freesia refracta alba* one of the most valuable flowers for forcing. In form it is something like a Gladiolus with the fragrance of a La France Rose or a bed of Violets. Its season is the latter part of winter. L. B. PIERCE.

[TO BE CONTINUED.]

TEXAS TO THE FRONT.

The following named nurserymen met in Dallas, Sept. 7, 1885, and organized the Texas State Nurserymen's Association:

J. W. Brice, Terrell; Robert Worth, Fort Drum; J. F. Emerson, Mineola; J. B. Baker, Fort Worth; A. W. Kerr, Sherman; E. W. Kirkpatrick, McKinney; J. R. Johnson, Dallas; J. S. Boyd, Bedford; E. I. Kennedy, Terrell; H. K. Harris, Duck Creek; D. J. Eddleman, Denton; Wesley Love, Jacksonville; L. K. Egerton, Denton; John H. Stone, Weatherford; E. N. Williams, Terrell; S. A. Mahon, Dallas; J. M. Howell, Dallas.

The officers for the ensuing year are: President, E. W. Kirkpatrick; 1st vice-pres't., J. W. Brice; 2d vice-pres't., A. W. Kerr; executive committee, E. W. Kirkpatrick, J. W. Brice, J. F. Emerson; secretary and treasurer, J. M. Howell. The next annual meeting will be held at Denton, on the second Wednesday in August, 1886.

J. M. HOWELL, Secretary.

AMERICAN INSTITUTE FAIR.

The annual Fairs of the American Institute of New York are among the chief attractions of the city at this season. Extraordinary efforts have been made to make this year's Exhibition more interesting than any previous one, and the great Exhibition Hall occupying the whole square bounded by 3d and 2d Avenues and 63d and 64th Streets has been put in complete repair. The Fair will continue from September 30th to December 5th, and will open with an Exhibition of plants, flowers, floral decorations, etc., continuing till the 3d of October. The Exhibition of fruits and vegetables will be held on Wednesday, the 7th of October, and continue one week. An Exhibition of Coniferous Plants will commence on Friday, October 16th, and continue one month, and an Exhibition of Chrysanthemums will be held some time in November. Liberal Premiums are offered, and no entry fee is required in these classes. Premium List may be obtained by addressing the Secretary, John W. Chambers, American Institute, New York.

WOMEN WORKERS

IN THE GARDEN AND FIELD.

A well-known doctor asserts that barbarous garments alone have incapacitated more women than over-study and over-work of all kinds.

The city engineer of Montreal has found a woman who for sixteen months has been engineer in a boot-heel factory, has a perfect knowledge of her business, and never met with an accident.

Susan Power writes of several women who have been very successful as florists and gardeners. We would like to have full accounts of any such successes. Many lady readers of THE AMERICAN GARDEN are practical horticulturists, to their honor be it said.

A woman driving about the country, with a little brother or son to hold the reins, is a common sight. But such a woman is not one of the sort who believes it part of her life to help and care for herself. The woman who can do and who loves to do these little things for herself is the one whose name will have an honorable record in the pages of life.

A woman may have no carriage, but she can hang delicate vine leaves along her porch, so exquisite in delicacy that no sculptor's art can equal it; no conservatories with their wonders, yet she and the sun can build up a coppice of blooming things in her dooryard of which every floral leaflet is a wonder of beauty and pleasure.

The kitchen garden would usually suffer but for the attention and thoughtfulness of the housewife. She need not do the hard work, but it will do her good to spend an hour there every morning superintending the work, and planning improvements; even pruning and weeding a little herself.

France has agricultural schools for girls. One of the chief is near Rouen, which has 300 girls from 6 to 18. The farm has over 400 acres. Twenty-five sisters are the teachers. The pupils are in great demand on account of their skill, as stewards, gardeners, farm managers, dairy women and laundresses. Each girl has, on leaving, an outfit and a small sum of money, earned in spare hours. If they want a home, they can always return to Darnetel, which they are taught to regard as home.

Marriage is not the chief end of every woman. A Dakota girl says: There is no love-making in my half section. It's nothing but number 2 Wheat from May to August. That's what we are out there for. Now, I own and manage a farm of 320 acres, and this year I took out a crop of eighteen bushels to the acre and sold it, got the cash, put it in the bank, discharged all my men but one, who will look after things this winter, and I'm off for a little fun down east. Marriage? that's what all the good-for-nothing cranks of men that I see from plowing time to harvest can talk about. What do I want to get married for? There are over 300 of us girl farmers in Dakota, and we will hold a convention some time. I never saw a man yet that I would have around.

ANSWERS TO CORRESPONDENTS.

Gloxinias.—Mrs. M. C. P., Ohio.—Seed may be sown at any time, but spring is best. Being extremely fine it must be covered but very lightly, and kept constantly damp; the soil should be light and rich. The seedlings will generally vary in many shades and colors. Gloxinias may also be propagated by dividing the roots in spring, but the usual method of propagating plants is by their leaves which root readily in an ordinary propagating bed.

Hibiscuses are about as hardy as Geraniums. Snuff has little effect on black aphid, but Tobacco tea or Tobacco soap not very satisfactorily.

Tulip Seedlings, White Fringo.—H. G. M., Ind.—There is no difficulty in raising Tulips from seed. Sow as soon as the seed is ripe. When the seedlings first bloom they generally produce flowers without stripes, and it may be several years before they "break," after which they retain this special character.

The White Fringo Tree, *Chionanthus Virginiana*, may be propagated by seeds or cuttings. It is also frequently grafted on common Ash, which makes it grow more vigorously.

Irish Juniper and Golden Retinospora are generally hardy in latitude 41, unless planted in very exposed positions.

California Fuchsia.—R. L., New York.—There is no true Fuchsia indigenous to California. This name has been suggested, we believe for *Zauschneria Californica*, a very pretty plant resembling somewhat a Fuchsia in general appearance.

Cure for Flies.—Mrs. L., Seabright, N. J.—Yes, there is a complete and easily applied remedy for flies, and this is Buhach. We would not be without Buhach in the house for a good deal. Close all the doors and windows, and dust the powder against the ceiling and walls, with the little bellows made for the purpose; keep the room closed for half an hour, then come with a broom and dust-pan, and sweep up the flies from the floor by the shovelful. By keeping the room dark when not used, flies will not trouble you any more that day. Mosquitoes may be killed in the same way, and more effectively still by burning a small teaspoonful of Buhach on a tin plate, or a piece of paper.

The questions about Roses were fully answered in our August number.

Plants for a Small Greenhouse.—A much greater variety of plants may be grown in an ordinary greenhouse with a temperature of about 50° than is generally supposed, provided proper care is given to watering, ventilation and cleanliness. The following will be a good collection to begin with: Azaleas, Camellias, Daphnes, Heliotropes, Acacias, Stevias, Abutilons, Chorizemas, Jessamines, Fuchsias, Mahernias, Geraniums, Verbenas, Cupheas, Sulfias, Calceolarias, Cinerarias, Carnations, Callas, Primulas, Roses, Violets, Bouvardias and many others.

TRADE NOTES.

ITEMS OF GENERAL INTEREST FROM THE SEED, NURSERY AND FLOWER TRADE ARE SOLICITED.

Chas. V. Mapes, friend of gardeners, takes his rest in beguiling the gentle blue fish into his stew pan.

W. Alice Burpee has been spending his vacation in the mountains. No doubt he comes back full of strength and ideas for the work of the coming campaign.

P. M. Angur & Sons report a rousing fall trade in Strawberry and other small fruit plants. It ought to be so, for they have a Jewel in that new Strawberry.

The Hudson river fruit growers have a fine prospect for a big Grape crop, and so may perhaps retrieve the losses caused by drought to the Strawberry and other early crops.

Mr. Hitchings, head of the well-known firm of Hitchings & Co., New York, manufacturers of greenhouse heaters, is dead. He was a successful and honored merchant.

The florists hope to gain greatly by the influence of their recent meeting at Chelmsford, and we believe they will. The nurserymen and fruit growers, as well as the dairymen and breeders, have helped their business greatly by similar meetings and organizations.

C. M. Hovey & Co., 21 South Market St., Boston, announce their succession to the late firm of Hovey & Co. Mr. C. M. Hovey was long connected with the latter firm, of which it seems a pity to change the name. The Hoveys have a well-known and honored name in the seed and plant trade.

Our genial friend, Joseph Harris of Rochester, N. Y., writes that his seed crops this year are remarkably good, especially of Onion, Mangold, Beet and Celery, but the frequent rains he fears (Sept. 9) may interfere with the proper curing of the Onion seed.

The A. C. Nellis Company, is the style of a corporation recently formed by A. C. Nellis, *pres.*, F. E. Simons, *vice pres.*, C. F. Wheelock, *treas.*, W. H. Fincham, *sec'y.*, and T. A. Howland. The new corporation will carry on the late seed business of A. C. Nellis at Canajoharie, N. Y. Capital stock, \$50,000. We suppose that "Mohawk Valley Seeds" will now be boomed.

W. W. Rawson, Boston, though a seedsman now, is still a shrewd market gardener. He lately showed us a sample of four Montreal Musk Melons averaging 15 lbs. each, which took first prize at the Massachusetts Horticultural exhibition, and then he sold the lot in Quincy market for \$10. A good strain that, to get stock seed from.

GOOD WATER.

The Wankesha Glenn water advertised in this issue is one of the very finest of all table waters, and is fast becoming known as a specific for many diseases of the stomach and bowels. It seems like "carrying coals to Newcastle" to bring spring water from the West to the East, but the Wankesha Glenn is gaining many converts to its virtues in all sections.

THE FLORAL WORLD.

This superb, illustrated magazine is now recognized as the best Floral Monthly published in America. It specializes the curiosities and beauties of the Vegetable Kingdom. Correspondence from all parts of the world. Specimen copy and packet Finest Mixed Pansy seed mailed on receipt of three 2-cent stamps. Address Floral World, Highland Park, Chicago, Ill. THE AMERICAN GARDEN and the Floral World one year for \$1.25.—*Adv*

The Largest Cabbage Growers in the World. (W. M. Johnson & Co. of Chicago.) use upwards of five thousand acres of land for growing Cabbages. Last season they manufactured nineteen thousand six hundred barrels of sauerkraut, besides shipping four hundred and sixty-seven carloads of Cabbages to eastern cities. They use and recommend Tillinghast's Puget Sound Cabbage Seeds. The disseminator of this renowned brand of seeds, Isaac F. Tillinghast, of La Plume, Pa., in order to introduce them into every county in the Union, has organized a Seed and Plant Growers' Association. One reliable party in each town in the Union is being enrolled as special agent, and is supplied with seeds in trade-marked packages and also instruction books which will enable anyone to grow Cabbage plants successfully anywhere. Parties desiring seeds or plants, will, upon application to Mr. Tillinghast, be furnished with the addresses of agents nearest them from whom they may be obtained. Purchasers are thus saved unnecessary express charges and assured of obtaining the best strain of Cabbage seeds or plants which can be procured.

This association thus furnishes one man in each town—the appointed agent—a good cash-paying business in selling seeds and growing and supplying plants. There are still many excellent localities unoccupied, and anyone so situated as to act as agent for this association should address Mr. Tillinghast as above, for particulars in regard to it.

Mr. Tillinghast has also just put upon the market a "Cabbage Pest Powder" which is entirely harmless to the plant at any stage of its growth, and also harmless to persons eating them, yet the most effective destroyer of lice, fleas and worms which has ever been compounded. It retails at 24 cents per pound.—*Adv.*

What kind of cattle do they have at Zanesville, Ohio? A man advertises that he wants a woman "to wash, iron and milk one or two cows."

**COLGATE & CO'S
CASHMERE BOUQUET PERFUME.**

This is one of the richest, most lasting, and refined of all handkerchief perfumes. The name and trade-mark of

COLGATE & COMPANY

on every bottle assure purchasers of superior and uniform quality.

J. STEVENS & CO.

Rifles, Hunters' Pets, Pocket Rifles & Shot Guns.
**BEST SHOOTING! MOST CONVENIENT!
LIGHTEST ARMS Made in the World.**

SINGLE BREECH-LOADING SHOT GUNS.
Steel, \$12 50 Twist, \$15 50 Laminated, \$17 00

RIFLES.

24 in.	20 in.	23 in.	30 in.
22 Calibre, \$20 00	\$23 00	\$24 00	\$26 00
22, 28 or 44 Cal. 20 00	21 00	23 00	23 00

NEW MODEL POCKET RIFLES.

10 in.	12 in.	15 in.	18 in.
22 or 22 Cal. \$13 25	\$13 25	\$15 00	\$16 50

Pocket Shot Guns, 28 or 44 Calibre, same sizes and prices as above.

FIVE SUCCESSIVE SHOTS,
103 feet.

HUNTERS' PET

WEIGHT ABOUT 5 1/2 lbs.
May be carried in a carpet-bag. A sure shot at 220 yds.

The strongest point about all the Stevens' arms is their great accuracy, the next is their lightness and portability. Mr. R. P. Cory, of Consecoon, Canada West, says: "I have used for three years a Stevens' 22-cal. Pocket Rifle, have shot it about 15,000 times, can kill all sorts of small game with it a great deal farther than with the best Shot Gnn." Of course, the Hunters' Pets and Rifles will shoot still better. Mr. R. B. FULLER says he used a Stevens' Rifle in his gallery, 172 Clark St., Chicago, every week-day for eight years, shooting it over five hundred thousand times, and then sold it for only two dollars less than it cost him. This Target is not exceptionally fine, but gives a fair idea of what every Arm is expected to do before it can leave the factory. These Arms are sold by all Dealers, also by the General Agent, CHARLES FOLSOM, 106 Chambers St., New York City.

The American Garden Prizes of \$1,000.

For New Fruits, Flowers and Vegetables.

For the promotion of horticulture, THE AMERICAN GARDEN offers the following prizes of \$100 each, or silver plate of equal value.

(a.) The varieties put in competition are to be shown at three or more State, National, or other equally important exhibitions, in 1885 and in 1886, under the rules of the societies where exhibited.

(1) For the best Grape which shall combine territorial adaptability with superior shipping and table qualities.

(2) For the best Strawberry which shall combine territorial adaptability with superior shipping and table qualities.

(3) For the best Raspberry which shall combine hardiness, productiveness and superior shipping and table qualities.

Conditions as for (2). To be exhibited as above (a). \$100 or plate.

(4) For the best Gooseberry which shall combine large size, productiveness and freedom from mildew.

(5) For the best Blackberry which shall combine large size, good quality, hardiness and productiveness.

(6) For the best New Fruit (a new species is required) to thrive north of Virginia and Kansas.

(7) For the best new Potato which shall combine superior quality, productiveness, and freedom from disease.

(8) For the best new Vegetable other than Potato (either a new variety or species), table and shipping qualities and profitableness of culture to be considered.

(9) For the best new flowering Shrub which shall be hardy in the Northern States east of the Rocky Mountains.

(10) For the best new herbaceous Perennial flowering plant which shall be hardy in the Northern States east of the Rocky Mountains.

We shall make no claims or conditions whatsoever that would influence the naming or disposition of the prize-winning varieties.

The competition is open to North America.

The committee for the award of the Fruit prizes are:

J. L. Budd, Ames, Ia., professor of horticulture in the Iowa Agricultural College. Chas. W. Garfield, Grand Rapids, Mich., Sec'y Mich. Hort. Society. P. T. Quinn, Newark, N. J., Sec'y N. J. State Board of Agriculture. William Saunders, London, Ont. E. Williams, Montclair, N. J., Sec'y N. J. Hort. Society.

The committee for the award of the prizes for Flowering Plants are:

John Thorpe, Queens, N. Y., president Society of American Florists. Robt. Craig, Philadelphia, Pa. Robt. Halliday, Baltimore, Md. E. G. Hill, Richmond, Ind., Sec'y Society of American Florists. Harry Sunderbruch, Cincinnati, O.

Parties intending to compete are requested to inform the undersigned, for record.

Reports of judges on any new fruits, flowers, or vegetables at any exhibition in America are solicited. (Signed) E. H. LIBBY, Greenfield, Mass., May 1, 1885.

WEBSTER'S PRACTICAL

Probably all of our readers have occasion to use a dictionary every day. In some cases words cannot be correctly spelled; in others, the pronunciation is difficult; while in still other cases the meaning is not understood. This is true, not only of children and of the uneducated, but of many of the more intelligent as well; and every one who attempts to do without Webster's Practical Dictionary attempts to do without one-half of his opportunities for intellectual improvement.

Webster's Practical is an entirely new work by the editors and publishers of Webster's Unabridged and contains more than twice the amount of matter and illustrations ever before offered for the price.

Horse.
1, ears; 2, forelock; 3, forehead; 4, eye; 5, eye-lids; 6, nose; 7, nostril; 8, point of nose; 9, lips; 10, upper jaw; 11, cheek; 12, poll; 13, mane; 14, withers; 15, parotid glands; 16, throat; 17, neck; 18, jugular vein; 19, shoulder; 20, chest; 21, ribs; 22, back; 23, loins; 24, hip; 25, flank; 26, belly; 27, haunch; 28, thigh; 29, hock; 30, stifle; 31, leg; 32, tail; 33, back; 34, cannon or shank-bone; 35, arm; 36, knee; 37, passage for the girths; 38, elbow; 39, shank; 40, ball; 41, pastern; 42, coronary; 43, foot; 44, hoof; 45, fetlock.

It also embodies several entirely new features which render it pre-eminent to such a degree that for general reference in every household, it will not pay to use even the best of the older works any more than it would pay to journey across the continent in a lumbering old stage-coach while the numerous advantages of a lightning express are available.

The price is only \$1.00, but by arrangement with the sole agent, S. S. Wood, 134 1/2 West 33d St., New York, we are enabled to make this remarkable offer.

It will be sent with THE AMERICAN GARDEN, for only \$1.35 (add 10 cts. for postage). Send orders only to the publisher of THE AMERICAN GARDEN.

Nearly 1,500 First-Class Illustrations in Webster's Practical.

USE THE ONLY PURE WAUKESHA WATER.

WAUKESHA GLENN,

"QUEEN OF WATERS."

HIGHEST AWARDS OVER ALL OTHER WATERS, NATURAL OR ARTIFICIAL, AS A CURE FOR TROUBLES OF THE LIVER, KIDNEYS, BLADDER, ETC.

"PURE WATER is only to be obtained from NATURAL SOURCES."—Vide Lancet, July 7, 1853.

The dangerous qualities of contaminated drinking water are not obviated by the addition of wines or spirits.—Medical Officer Privy Council, England.

Pure water is even more important than pure milk.—New York Herald. The drink of the future.—Moody.

Helped more than two years' skillful treatment.—Samuel Stevens.

I am a living advertisement for this excellent Water.—W. Wilson.

Cured of Bright's Disease.—W. Hathaway.

The best merits all praise.—Hon. Geo. H. Peabody.

May the Glenn Spring continue to run Pure Water for ever and ever.—D. W. C. House.

"WAUKESHA GLENN" reigns alone among Natural Dietetic Table Waters. Its numerous competitors appear to have, one after another, fallen away until it has no rival.

With ladies, gentlemen, and ban vivants everywhere it has become the standard of dietary exponents, fortifying the digestive functions, and enabling free livers to indulge with impunity at the table. The world of wealth, intelligence and refinement testifies to its sparkling, naturally pure and delightful qualities, as the beverage incomparable, and accredits it with being the surest and speediest source of clear complexion, high health and exuberant spirits. Endorsed by the Medical fraternity. It has been tested by thousands, whose unsolicited testimonials are open to the public, and furnished to all who desire. **MAILED FREE.**

ADDRESS

T. H. BRYANT, WAUKESHA, WIS.

Waukesha is a delightful Summer Resort, on the Chicago, Milwaukee and St. Paul, and Chicago and Northwestern Railways.

THE AMERICAN GARDEN,

1886.

Owned, Edited and Written by Practical Men, for Practical People.

SOME NEW FEATURES.

LANDSCAPE GARDENING.

Illustrations of Country Places, with descriptions of their interesting points, to be begun at once, will be continued through the year. The series will include through the best adapted to show the proper way to plan and beautify the home grounds, not only for the very wealthy, but also for the family of moderate means.

OUT-DOOR DECORATION

Of the Village, suburban and country homes of working men and women, how by the means Nature provides in Vines, Ornamental Plants and Flowers, will be preached in five-minute sermons by lay workers.

LARGE PROFITS.

Profitable fruit growing and gardening is the great object of horticulture: profit in money, profit in health, profit in comfort, profit in beauty and profit in happiness. THE AMERICAN GARDEN seeks to promote all of these profitable phases of the science

and practice of horticulture, and we have arranged with some of the men who have made the unusual but quite possible profits of \$500 to \$1000 and more per acre, to tell our readers how they have accomplished these interesting results, so that others may follow their example. This will be a prominent feature of THE GARDEN through 1886.

WOMEN IN HORTICULTURE.

There are many noble women in America who have bravely decided that the consumptive needle, the humiliating paint-brush, the low wash-tub, the leveling shop, the low-pay office work, and the school room are not the only means of livelihood for their sex; that the culture of flowers, fruits and vegetables is quite as appropriate for women as for men, and many of them have won great success in the industry. We shall give the experience of some of these women gardeners, and point the way for others to follow them.

BOYS AND GIRLS

Who are so inclined shall be led along in the pleasant paths of gardening, and taught how to make many a dime and dollar, and at the same time store up health and experience. Many a youth has made himself independent, and a blessed help to tired mother and toiling father, all by pleasant work in the garden. See our special offer to Boy and Girl and Women gardeners.

NEW VARIETIES

Of fruits, flowers and vegetables, or "Novelties," will be duly chronicled each month, as begun in our last September issue.

THE MARKETS

Are the ultimate goal of the great majority of fruit growers and gardeners. We shall give a monthly review of the Metropolitan Markets, paying special attention to the uncommon fruits and vegetables, so that our readers may be able to judge somewhat of the advisability of their culture.

THE OLD FEATURES

That THE AMERICAN GARDEN readers know and like will be retained and improved upon so far as money and talent can improve them.

THE AMERICAN GARDEN has been and now is what may be briefly called a series of HOW PAPERS,

And described as follows:

- HOW—to Select Land,—to Choose what to Grow,—
HOW—to Cultivate all Fruit, Flower and Garden Crops,—
HOW—to Start and Run a Greenhouse,—to Begin with Fruits,—
HOW—to Begin with Flowers,—to Plant a Lawn,—
HOW—to Lay Out Grounds,—to Make the Homestead Beautiful,—
HOW—to Run a Market Garden,—to Market the Products,—
HOW—to Work a Kitchen Garden,—to Manage House Plants,—
HOW—to Manage the Window Garden,—the Private Conservatory,—
HOW—to Do Everything in Orchard, Vineyard, Garden, Conservatory, Lawn, Market Garden, etc.—
HOW—to Do Each Month in Fruit, Flower and Vegetable Culture, In-doors and Out-doors,—
HOW—to find Large Profit, and Full Health and Gentle Pleasure in gardening.

OUR CONTRIBUTORS

Number many of the best, most successful, most practical, most progressive Fruit Growers, Florists, Gardeners, Landscape Gardeners and Investigators in All Sections of North America, in South America and in Europe. We enumerate some of them as follows:

SOME OF OUR CONTRIBUTORS:

- P. M. Augur, Conn., State Pomologist.
Henry E. Alvord, N. Y., Manager Houghton Farm.
L. H. Bailey, Jr., Professor of Horticulture in Michigan Agricultural College.
J. T. Baird, Ky., market gardener.
W. C. Barry, N. Y., Fruit Committee American Pomological Society, etc.
Edward L. Beard, Mass., Committee on Plants, etc., Mass. Hort. Society.
P. J. Berekunans, Ga., Vice-President American Pomological Society.
W. M. Bowron, Tenn., amateur horticulturist.
W. D. Boynton, Wis., practical horticulturist.
J. L. Budd, Iowa, Professor of Horticulture in Iowa Agricultural College.
W. H. Bull, Mass., market gardener and florist.
Xenos Clark, Mass., scientist.
F. D. Curtis, N. Y., State statistician for U. S. Agricultural Department and farmer.
H. M. Engle, O., Vice-President State Horticultural Association.
Wm. Falconer, N. Y., gardener and florist.
A. S. Fuller, N. J., author and horticulturist.
Charles W. Garfield, Meh., Secretary American Pomological Society.
H. Gillette, Ill., editor Floral World and florist.
E. S. Goff, "Elm," N. Y., horticulturist to N. Y. Experiment Station.
Dr. E. H. C. Goodwin, U. S. A.
Chas. A. Green, N. Y., fruit grower, nurseryman, and editor "Fruit Grower."
J. H. Hale, Conn., fruit grower and nurseryman.
B. D. Hulsted, Ia., Professor of Botany in Iowa Agricultural College.
Dr. Sam. Hape, Ga., Vice-President American Pomological Society.
Peter Henderson, N. J., florist and seed grower.
Josiah Hoopes, Pa., State Pomologist.
Dr. T. H. Hoskins, Vt., fruit grower and nurseryman.
Gerald Howatt, N. Y., practical farmer and gardener.
J. Jenklus, O., nurseryman.
Mrs. S. O. Johnson, "Daisy Eyobright," N. H.
J. T. Lovett, N. J., fruit grower and nurseryman.

- H. H. Lyman, Va., President State Horticultural Society.
J. W. Manning, Mass., Landscape Gardener and Nurseryman.
Mansfield Milton, O., nurseryman and florist.
T. V. Munson, Tex., nurseryman and fruit grower.
W. F. Massey, Md., horticulturist.
P. B. Mead, N. Y., landscape architect and horticulturist.
A. Oemler, Ga., truck farmer and President Horticultural Society.
N. Olmer, O., President State Horticultural Society.
Chas. E. Parnell, L. I., horticulturist.
S. Parsons, N. Y., Superintendent of Central Park.
L. B. Pierce, O., florist and landscape gardener.
Susan Power, Mass., author.
P. T. Quinn, N. J., fruit grower and Secretary State Board of Agriculture.
E. S. Rand, Brazil, author and collector.
W. H. Rand, Vt., practical farmer and gardener.
E. E. Rexford, Wis., florist.
E. P. Roe, N. Y., author of "Success with Small Fruits," etc.
J. B. Rogers, N. J., Chairman State Fruit Committee.
Wm. Saunders, D. C., Superintendent Public Grounds.
H. J. Seymour, N. Y., Superintendent Oneida Community.
N. J. Shepard, Mo., practical farmer and gardener.
Chas. H. Shinn, Cal., author and amateur horticulturist.
Jean Sisley, France, florist.
J. M. Stahl, Ill., practical farmer and gardener.
W. E. Stone, Mass., chemist State Experiment Station.
E. D. Sturtevant, N. J., florist.
M. C. Weld, N. J., practical agriculturist and horticulturist.
Mrs. J. S. R. Thomson, S. C., amateur horticulturist.
John Thorpe, L. I., President Society American Florists.
Marshall P. Wilder, Mass., President American Pomological Society.
E. Williams, N. J., Secretary State Horticultural Society.

HORTICULTURE FOR ALL SECTIONS.

A JOURNAL OF HORTICULTURE FOR ALL SECTIONS. That THE AMERICAN GARDEN is essentially well adapted to the needs of nearly all sections of the country, and of interest and value to horticulturists of any country, the above prospectus and list of contributors proves beyond discussion.

Prospectus continued on next page.

THE AMERICAN GARDEN.

PROSPECTUS FOR 1886.—CONTINUED.—

AN INCREASE IN SIZE

Of THE AMERICAN GARDEN to 32 pages, besides the cover, is made with this issue, which will be permanent. The increase in size will give room for the improvement of the old, and addition of the new features above mentioned.

RISE IN PRICE TO \$2.00 A YEAR.

The increase in size and expensive improvements we are making in this magazine compel a corresponding increase in the subscription price from \$1.00 to \$2.00 a year, a step which we are sure many of our readers will endorse because it will bring greatly increased value in return. However,

THE PRICE TO JAN. 1 IS \$1.00,

And any of our present subscribers may now send in their subscriptions for 1, 2, 3 or 5 years in advance at \$1.00 a year, to continue on from the time that their present subscriptions expire, whether that is before or after Jan. 1.

TERMS FOR SUBSCRIPTIONS.

\$1.00 a year to Jan. 1, '86: 10 cts. a copy; 60 cts. for 6 months; 30 cts. for 3 months.

\$2.00 a year after Jan. 1, '86: 18 cts. a copy; \$1.00 for 6 months; 60 cts. for 3 months.

Subscriptions will be received before Jan. 1, for 1 to 5 years, at \$1.00 a year.

FOREIGN SUBSCRIBERS will add 24 cts. to the subscription price, for postage.

WOMEN, BOYS AND GIRLS.

SPECIAL REDUCTION IN PRICE TO THE YOUNG GARDENERS.

Any woman and any youth under 21 years of age who is actually engaged in gardening may receive THE AMERICAN GARDEN for one year at 25 per cent reduction from the regular price.

E. H. LIBBY, PUBLISHER,

GREENFIELD, MASS., No. 47 Dey St., NEW YORK, No. 94 Dearborn St., CHICAGO.

Ten " " "	- - - - -	7.50.
One copy, 1 year, to any person sending us 3 new subscriptions	- - - - -	at \$1.00 each.

PREMIUM COMBINATIONS, SEE PAGES 275 AND 279.

ADVERTISEMENTS.

All advertisements are measured in agate type, that is, at the rate of 14 lines to the inch.

RATES.

25 cts. per line, each insertion; for orders aggregating 150 lines, 20 cts. per line; for orders aggregating 1,000 lines for consecutive insertions within one year, 15 cts. per line.

CIRCULATION 15,000,

wholly among gardeners, fruit growers, florists, nurserymen and amateurs interested in fruits, flowers and gardening.

SEE PREMIUM COMBINATIONS ON PAGES 275 AND 279.

SAMPLES OF WHAT MANY THINK AND SAY.

I have carefully read your most valuable paper and consider it the best I have ever seen of its kind, and cheap enough without a premium.—John Jeannin, Jr., Rens. Co., N. Y.

It is the best horticultural Journal published, and I wish you and it much prosperity.—G. Klarner, Quincy, Ill.

I find THE GARDEN growing in interest. That picture on the title page for June was fine. I see you take great pains in editing all the matter you present and I find it quite helpful. You are making a good magazine and you ought to be encouraged in your work.—W. H. Bull, Market Gardener, Hampden Co., Mass.

I would not be without THE AMERICAN GARDEN on any condition. A handsome paper certainly.—W. E. Abbs, Florist, Fond du Lac, Wis.

I have been a subscriber a number of years and enjoy its contents very much.—C. O. Giers, Providence, R. I.

It is of much more value to me than Journals costing twice as much.—Horace G. Munson, Lincoln, Ind.

I consider THE AMERICAN GARDEN a thoroughly practical and useful journal.—E. M. Van Aken, Elmira, N. Y.

I have taken THE AMERICAN GARDEN for a number of years. It fills a place long needed in horticultural publications. I am very glad to see it improved.—Geo. J. Streater, Garrettsville, Ohio.

I would not exchange THE AMERICAN GARDEN for any other horticultural Journal in the country, and you may rely on me to be one of your regular subscribers.—R. H. Arming, Hampden, Md.

The September number more than any previous one of my acquaintance, is artistic and practical, and although not the paper for the professional horticulturist or florist, yet a paper I suspect we cannot do without.—H. B. Orinsey, Nurseryman & Florist, Fredonia, N. Y.

I could no more do without THE AMERICAN GARDEN than I could without a daily newspaper.—Mrs. E. H. Hesse, Utah.

THIS MAGAZINE IS SENT

this month to many people who were formerly subscribers, and to many who have seen only a few numbers. Please examine this copy carefully, and think twice before laying it aside.

You will be a welcome addition to our family of subscribers.

MEN AND WOMEN

BOYS AND GIRLS

Can make good pay by getting subscriptions for

THE AMERICAN GARDEN.

1518 E. Main St., Richmond, Va.,
July 25, 1885.

MR. BENJ. HAMMOND, Fishkill-on-Hudson, N. Y.:

DEAR SIR—This is the second year I have used "Hammond's Slug Shot" on Cabbages, Potatoes, etc., and beg to testify to its efficacy in quickly clearing out Cabbage Worms, Potato Bugs, etc. It is the cheapest and best preparation I have ever tried, and should be universally used as a cheap exterminator of insects preying upon vegetable products.

I have sold a quantity of it which has given universal satisfaction.

Yours truly,

T. W. WOOD.

EARLY NEW ZEALAND POTATO.

Ten days earlier than Early Rose. Not excelled in cooking qualities and for Table use. A wonderful yielder. I control the entire stock of this new potato. Price \$1.00 per lb. prepaid. INDIAN SUMMER DAYS.

The autumn fires, so late alight,
Far up the mountain sides,
While slapping from the falling leaves
Adornings meet for brides,
Are changing now to ashen hues,
And dying slowly down,
Shining, purpling, flocking, fading
To a dusky brown.

The Queen of Morn unbars her doors,
In fir-off eastern skies,
Her presence-chamber seeks anew,
Where richest Persian dyes
Lie thick in forest and on field,
While all around is calm,
And low-voiced wind-harps softly chant
In restful, rhythmic psalm.

Cerulean heavens stretch away
Above a lustrous haze,
Rich autumn fragrance fills the air—
Too brief the hours and days.
And yet, when twilight shadows fall,
There comes, in swelling wave,
Quick grief that all this loveliness
Hangs o'er an open grave,—

A grave that hath not victory,—
Death without all its sting.
For rolling years have treasures yet
Which they will surely bring
To us when winter's reign is o'er.
In springtime's opening day,
When leaf and flower shall come again,
And new life lead the way.

—Clark W. Bryan.

A GROWL.

How we do get "taken in," occasionally, by the florists of whom we purchase plants! I don't mean by that that they charge too much for plants, or send out worthless plants, or do not fill the orders. Nothing of the kind. Most dealers, in my experience, have proved to be fair-dealing men, liberal and prompt, and having a pride in the reputation they have established for honesty and square-dealing, which is not only justifiable, but commendable. Where we get "taken in" is the general confusion that exists in their catalogues regarding the names of varieties of plants. For illustration let me give some of my experience this last year.

I ordered a Champion of the World Fuchsia from one dealer, and a Phenomenal from another. When the plants bloomed, they were exactly alike. I ordered a Safrano Rose from one dealer, and a Sunset from another. Both proved to be the same in all respects. Here there was a chance for dishonesty, since these two Roses resemble each other so much that the man who sent the Safrano might have thought he could pass it off on me as a Sunset. I ordered a Victor Hugo from one florist, and a Mad. Blauvelt from another, and no one can detect any difference in them. This is something that happens every year. If you order from the same firm all the time, it is not likely that you get the same plant, or variety, under two names, but if you order from some other firm, you do. Do florists buy up stocks of plants and give them a new name in their catalogues in order to make us think they have varieties that other dealers do not have? It certainly looks so.

Now I protest against this. It is not fair. It is not honest. I very often name a desirable variety in my floral articles, and often persons who read those articles send to a florist for a plant of that kind. If they happen to send to the florist my plant came from, they get one like mine, but if they

send to another dealer, three times out of four they receive an entirely different variety. This is very provoking. It makes it necessary, in describing a variety, to say that it came from a certain florist. There is no dependence to be put in the nomenclature of the catalogues.

EBEN E. REXFORD.

NOVEMBER FLOWER STYLES.

The fashions of the late autumn are extremely rich and elegant: they are remarkable for simplicity, naturalness and grace, as they have been thus far since fall set in. Until Jack Frost nipped the wild flowers these were preferred to cultivated blossoms for personal decoration. Golden-Rod and Ox-eyed Daisies were worn in bouquets de corsage and brides selected the unaffected Michaelmas Daisies for the garniture of their robes. These flowers, by the way, bid fair to be very fashionable another season, for gardeners are bringing them under cultivation.

The blue and purple fringed ones are exceedingly pretty. At a very stylish morning wedding lately where the bride wore a travelling gown of mauve Irish poplin, her flowers were Golden Rod, Ox-eyed Daisies and purple Michaelmas Daisies.

CHRYSANTHEMUMS.

Single Dablias have been very favorite this fall, but at present the flower that rules is the Chrysanthemum, which appears to hold the hearts of the community as firmly as heretofore. The largest decorations are made with Chrysanthemums; they are used for ornamenting the table, they are worn on the person, and carried in bouquets. Even their peculiar, frosty fragrance is esteemed delightful. There is a certain woody spice to them that is refreshing; and it is a reminder of the paths in the thicket which were odorous all summer of the same scents—a mixture of moss and marsh and tree-bark. The curious Japanese varieties of Chrysanthemums of crimson, gold, yellow and purple, many of them looking like tassels of fringe, are prepared for the corsage bunch. These are also arranged in the hair to be highly effective. Blondes choose the golden pompons, and brunettes wear those of deep red.

There are 700 varieties of this flower for sale in New York this season. Decorations made of the many shades and forms of yellow Chrysanthemums are superb. While those with the quilled petals are used for massing, the Japanese sorts are worked into the most gorgeous golden fringing. Church altars are magnificently embellished with Chrysanthemums. The tall standard plants are placed in the background, while the dwarf, bushy ones, spangled with their yellow balls, stand below. The railing of the chancel is cushioned with cut flowers.

DINNER TABLE DECORATIONS.

A very pretty and economical style of ornamenting dinner tables, is with grasses, either fresh or dried. Some species of *Agrostis* can be so arranged that they will look charmingly fanciful. Everlasting flowers (*Hamphrena*), with their rich colors of red, purple and creamy-white, are very suitable for mixing with light grasses. The center piece when these flowers are employed should be composed of Coxcomb's and Prince's Feather, which, when unssed in a round or oval center basket, and fringed

with greens or grasses, is unique and elegant.

ROSES.

Greenhouses are hardly in full blast as yet, although we are getting a handsome crop of the new Roses, Wm. Francis Bennett, and American Beauty. Never before have we had a large, red, fragrant Rose in autumn; the little Douglas, with its loose petals, has always been insignificant, and the Duke of Connaught, heretofore the earliest of winter-blooming Roses, is odorless. Our new red Roses are highly appreciated; it is prophesied that the Jacqueminot will never again be watched and waited for with so much eagerness as formerly, although neither the "Bennett" nor "Beauty" can compare with it in the velvet finish of its petals.

LILIES OF THE VALLEY.

Lily of the Valley was brought in very early from the greenhouses this fall and it has been the choicest white flower in the market. The wedding bouquets made of it are all flat in form, the sprays being so laid on the foliage as to radiate from the center. *Asparagus tenuissimus* combined with these Lilies is a light and lovely relief of green.

GARDENIAS.

The wax-like, sweet-scented flowers of Cape Jasmine are very fashionable for wearing in the hair. From three to five of these blossoms are placed in the coil of hair twisted on the top of the head; the effect is one of dignified grace. Gardenias continue to be the favorite flower for boutonieres.

DRESS GARNITURES.

All the ingenuity of modistes and florists is agitated to invent tasteful styles in dress garniture with natural flowers. The little Mignonette Rose and Carnations will be employed extensively for berthes and bretelles on account of their shape and size. Hinsdale Carnations, and the charming, rose-colored "Grace Wilder" Pink are quite the rage for edging the low or square-neck and short sleeves of ball dresses; in fact, the entire short sleeve is made of these flowers.

Lace evening gowns trimmed with long-stem Carnations are exquisite: these flowers are easily tacked on to lace with fine sewing silk, and the effect of stem, foliage and flower on the filmy fabric is lovely. A pink silk tulle dress garlanded on the over skirt and corsage with *Asparagus tenuissimus* is beautiful and fairy-like. The foliage of this *Asparagus* is durable and has a lacy elegance on tulle and light net material that is indescribably fascinating.

Croens produce a charming effect when planted in small clumps in the lawn near the dwelling. All that is necessary is to lift here and there pieces of sod about a foot square, place about half a dozen bulbs on the soil, and replace the sod. When each one of these little clumps consists of but one color, the effect is far more pleasing than when all colors are mixed.

Hyacinths, Tulips, Narcissus, and all kinds of spring-flowering bulbs may still be planted at any time before the ground freezes, but the sooner it is done the better. There is nothing more pleasing and cheering in a garden than the bright spring greeting that a blooming bulb bed gives. When the soil remains frozen in dry lime, cover the bed with leaves and evergreen boughs.

AQUATIC HOUSES.

In conservatory building as in other branches of horticulture, new styles and devices supersede old and familiar ways. The latest development in this direction is the aquatic house; and soon all who can afford such a charming luxury will connect a miniature Lily lake with their greenhouses and conservatories.

Our illustration represents the aquatic house of Mr. J. M. Hodgson which stands among a group of grand greenhouses on the corner of Bellevue and Leroy avenues, Newport, R. I. The house is 120 feet long by 30 feet in width, and the tank which extends through its center is 100 feet long, by 20 in width, and is three and one-half feet in depth. In this tank many beautiful and curious species and varieties of day and night blooming water plants are cultivated; from

is surrounded by specimen *Dracaenas*. The side benches are covered with *Gloxinias*, the large, velvet-lined cups of which have made a gorgeous cushioning to these shelves. Tropical growth is distributed throughout the house as shown in our illustration.

There are three fountains in the tank, and it is illuminated from the top with green-hooded lamps, which shed a light peculiarly soft,—like moonlight,—and bestow a fantastic effect on this graceful scene, where the rich scents of night-blooming flowers and the sounds of "trickling waters" add to the fairy-like surroundings.

Heretofore, those fond of water-plants have grown them in tubs, which are unsightly, and too contracted for any satisfactory collection. Mr. Louis H. Meyer of Staten Island, in two pools before his dwelling has grown a modest collection of *Nymphaeas*. Mr.

aquatic houses will be among the delightful resorts of American gardens, where the night-blooming, as well as other interesting water-plants, may be studied.

Adjoining the Palm house in the new range of greenhouses of Ex-Governor Samuel J. Tilden, at Greystone, Yonkers-on-the-Hudson, is an aquatic house where the tank is to be sunk in the ground, and its margin embellished with water growth. All around the sides of the pool will be rock-work, which will provide ample opportunity for an extensive collection of mosses and other interesting plants that will flourish under like conditions.

South of New York many of the choicest water plants may be grown out-doors in summer. In the sunken parterre in front of the large Palm house in Fairmount Park, Philadelphia, are two large basins in which

THE AQUATIC HOUSE OF J. M. HODGSON, ESQ., OF NEWPORT, R. I.

the ordinary White Pond-Lilies, to those superb pink and blue natives of the eastern continents. The specimens of white, night-blooming Water-Lilies from Brazil, *Victoria regia*, the flowers of which are 12 inches in diameter, have attracted marked attention this summer. The Sacred Lotus of India, *Nelumbium speciosum*, the leaves of which are, some of them, over two feet in diameter, also blossomed in this tank, as did *N. luteum*, the Yellow Nelumbo, or water Clingupain.

There are but three aquatic houses in operation in the United States, although there are some in course of erection. Mr. Hodgson's house is a delightful exposition of how water and rock plants in connection with a chain of greenhouses. At the right hand side of the front of the picture is a pyramid of rock work, among which are growing Ferns and Lycopodiums, Grasses, Cyperus, water vines, and blooming plants that thrive where there is moisture. This rocky mass

Jay Gould in his Mosque Palm house, has a fountain where a few aquatic plants thrive. Mr. Charles J. Osborn has a small pool, which is fringed by water-growth, and a rockwork bank surrounding it. This is formed of peculiar rocks found in New York State, which are admirably suited for rockeries in aquatic houses. This is placed opposite an end of the building where the wall is entirely upholstered by Lycopodium, which is studded with groups of grasses, Begonias and Adiantums.

Aquatic houses, where they are lighted, so that Lilies that open in the evening may be watched and enjoyed, are excellently adapted for many night-blooming flowers, like the Jasmine and *Cereus* that are in their glory about midnight, when they throw out the most delicious fragrance. There are many persons who would appreciate the privilege of viewing the expansion of these magnificent blossoms under such charming conditions. The time is not far distant when

the beautiful lavender blue *Nymphaea scutifolia*, the pink *N. stellata rosea*, the bright red *N. rubra*, together with our native *N. odorata*, the dwarf Chinese *N. Pygmaea*, and many other charming aquatics thrive and bloom in luxuriance. The hardier kinds remain in their positions the year round, the basins being covered with boards in winter. The freezing of the surface of the water does not injure them, all that is necessary is to prevent the roots from becoming frozen. Very tender species are taken up in the fall with their roots entire, planted in tubs and wintered in a greenhouse. At Bordentown, N. J., Mr. E. D. Startevant has grown *Victoria regia* in an out-door tank, treating it like a tender annual.

The establishment of aquatic houses, and the awakening of an interest in the fanciful growth that is suitable for proximity to water, will undoubtedly lead to the beautifying of many much neglected brook-sides and water courses on estates otherwise finely cultivated.

Newport.

Fruits.

SEASONABLE HINTS.

During the mild days of early November, trees and shrubs may still be planted where the soil is dry, and there is no danger of water standing during winter. The later in the season a tree is planted the more carefully should the work be performed; in exposed situations the stems should be tied to stakes to prevent their becoming bent or blown over by winter storms.

Heeling-in.—Being aware of the frequent delays in obtaining nursery stock ordered in spring in time for planting before the rush of work begins, many fruit growers prefer to order what trees may be wanted, in the fall, and to heel them in carefully, so as to have them at hand in good season next spring. This is a good plan, which not only saves time and vexation but insures better success. The holes in which the trees are to be planted may be dry at any time before the ground freezes: the frost will pulverize the soil thrown out, and in spring the trees may be planted at the earliest opportunity, without exposing their roots more than a few minutes.

Raspberries and Blackberries should, whenever feasible, be planted in autumn, the canes be cut off to within a few inches from the ground, and some coarse manure be scattered along the rows.

Grape Seed may be sown at any time before the ground freezes. Only seeds from the ripest and most perfect bunches and berries should be selected. The seed bed should be made rich and mellow; the seed be covered with about one inch of soil, and in winter be lightly mulched with leaves. Or the seed may be washed out, dried, kept in moist soil during winter, and planted as early in spring as possible. The seed should be sown thin enough that the young plants may not crowd each other. When a year old the seedlings have to be taken up and transplanted in rows, allowing them sufficient space for full development.

Cleaning Cider Barrels.—The best time for cleaning a cider barrel is immediately after its contents have been drawn off. When the sediment has once become dry and hard, and has formed a crust in the barrel, it is exceedingly difficult, and often impossible, to so thoroughly clean a barrel as to make it suitable for first-class cider. The most effectual way to clean a barrel is to take out one of the heads, and scrub all the inner side of the barrel thoroughly with boiling water, and after the head is replaced to burn some sulphur tape in it. With rusty rasks it is of no use to spend any time: they can never be completely cleaned again, and will spoil vinegar even. The best use to make of them is for swill or fire wood.

From the returns to the Agricultural Department it appears that the Apple crop is little, if any, above that of an average "off" year. The exceptions to this are those orchards where from spring frosts or other causes, the yield of last year was deficient. This was the case in New England, especially in Connecticut and Rhode Island, and as a consequence a full, medium crop was gathered there this year.

STANDARD CURRANTS.

To many persons Currant bushes appear as fit companions only to brambles and weeds in neglected fence corners, and the suggestion to grow them for ornament may seem somewhat startling. Yet well trained Currants and Gooseberries are highly ornamental and useful as well, and form beautiful objects in the mixed borders.

Training Currants in tree form should begin with the planting of the cutting, by removing every bud but the upper one, so as to throw all the strength into the terminal shoot. If a low heading tree is desired this

A STANDARD CURRANT.

shoot is cut off the second year, at a height where all the branches are to form the head. Not more than four upper side shoots should be allowed to grow. The following year these are also cut back, and each succeeding year the strongest shoots have to be shortened in, the superfluous ones and old wood cut out altogether so as to maintain an open, well-shaped head. If a higher stem is desired, the terminal growth has to be encouraged for two or three years, cutting off all side branches every year from time to time until the proper height is reached. Somewhat more care is necessary to train

Currants in tree form than in a bush, but the principal reason why it is not more frequently practiced is that when the Currant borer gets into the stem the whole tree is lost, while in the bush the loss of one or more shoots is of comparatively little consequence, as others will soon take their places. Some of the hardier species, however, *Ribes aureum*, the Missouri Currant, especially, are almost entirely exempt from the attacks of the borer, and by using these as stocks for grafting the improved varieties upon them—similar to the methods employed in producing standard Roses—the danger from borers is reduced to a minimum. To amateur fruit growers who have never seen Currants trained in this manner, experiments in this direction will afford much interest and fascination.

LARGE PROFITS.

How \$1,295 net Profit per acre of Strawberries were made by P. M. Augur & Sons.

Within a stone's throw from the Middlefield Center, Conn., Station on the "Air Line" Railroad lies the now famous "Jewell" Strawberry patch of Messrs. P. M. Augur & Sons. Having visited the place the past season, just before the general picking commenced, and having then and there beheld the most abundant crop of Strawberries we thought we had ever seen, we became much interested to learn the details of cultivation and the amount of the profits derived from the plantation, which information was cheerfully given by the proprietors.

The bed measured one twenty-second part of an acre—as we know from actual measurement. In 1882 it was in grass, and yielded at the rate of half a ton of hay per acre; in the spring of 1883 it was turned over smoothly, and about two cords of good stable manure spread and harrowed in with a La Dow harrow; then planted as a kitchen garden. In the spring of 1884 another cord of fine stable manure was spread, and the ground sowed with Peas; a dressing of about four bushels of ashes was applied to the soil at the same time.

After the Peas had been harvested the ground was well plowed and planted with Jewell Strawberry plants, twenty-six rows two feet apart, each row containing twenty-six plants 18 inches apart. Every fifth row was a bi-sexual variety not included in the matured area, nor was their yield counted with the Jewells. The plants' ordinary layers were set out the first week in August. Ashes, hen manure and a compost of leaf mould, lime and ashes were scattered between the rows and hoed in.

The plants were hoed eight times before winter and the runners cut at each hoeing. When the ground froze the plants were mulched with coarse hay. About May 1st the mulch was removed and the ground skim hoed; after blooming and when the first fruit had fully set, the mulch, or a part of it, was replaced between the rows.

The yield was 678 quarts of large, beautiful berries, exclusive of those sampled by hundreds of visitors, and the many quarts given away to various persons and exhibited at fairs. Now as the average price received for the berries was sixteen cents per quart (some sold for twenty-five cents), the to-

tal amount would be \$108.48 for one twenty-second of an acre. The figures are as follows:

Gross returns,		\$108.48
Picking,		
Marketing,	\$13.50	
Setting plants,	5.00	
Plowing and hoeing,	1.50	
Stable manure chargeable,	4.50	
To Strawberries,		
10 bush. ashes,	10.00	
10 bush. bon manure,	2.50	
Leaf mould, ashes and lime,	3.00	
Compost,		
Interest on land,	3.00	
Total expenditure,	.55	
Net profit 1-22 acre,	49.61	
Rate of profit per acre,	58.87	
	1295.14	

No charge was made for the plants set out, as the young plants produced this season far more than compensated for the original stock; and the prospect for a crop another year from the old plants is excellent.

COCONUT CULTURE IN THE UNITED STATES.

When visiting Southern Florida three years ago I found among the Keys and along the Atlantic Coast a number of Cocoa Palms growing vigorously, and producing a full

the manufacture of cordage, rope, hags, and matting, and for upholstering mattresses, etc., while many of the brushes now in common use are made of fiber obtained from the leaf and husk. The shell is used for making cups, dippers and vessels of like uses, a vegetable charcoal can be made from it, and it is also ground and sold under the name of spice mixture. The kernel supplies food to many of the human race. In the tropics it is generally used while in the soft or jelly state, eaten with a spoon. The milk or water is transparent until the kernel is formed, and hard when it becomes white or milky in color. While this transparent state exists the water is used for drinking to a great extent, taking the place of spring water. Oil is extracted in large quantities and forms not a small item of the world's commerce. The spathes are tapped and the juice of the tree drawn and manufactured into jaggery and arrack.

The entire area devoted to the growth of Coconuts in tropical America, Asia and Africa is estimated at over three million

currents of water. The bearing age commences at from four to seven years on a coral sand along the sea, while in the same country a short distance inland, a tree requires double the time to arrive at the producing age. The number of nuts per tree varies from forty to 200 annually; one hundred to the tree is a fair yield. In favorable locations cultivation is not needed, as the young plant likes partial shade, which native growth readily supplies. All that is required is to plant the nuts where the trees are to remain, as they do not bear transplanting. The seed nuts should be large, fully matured, and be planted in the natural state, that is with the husk undisturbed, and covered with about three inches of soil.

The first attempt at Coconut planting in Florida was made during my visit there, three years since. The following winter one hundred thousand were planted, last winter a still greater number, and another large planting will be made during the coming winter. The success so far has been all that can reasonably be expected; and although the area

FLORIDA COCONUTS. THE BEGINNING OF A GREAT INDUSTRY.

crop of fruit. These trees have undoubtedly sprung up from nuts that have been washed ashore. The largest ones, shown in our illustration, are twenty-five to thirty years old, and stand about seven miles north of Cape Florida. The habitation under the trees was built by Mr. Lum, formerly of Sandusky, O., from drift lumber found on the beach, and thatched with Palmetto leaves. The fact that these and other trees in this region and in Key West are succeeding so well without any care whatever, suggested the thought of the feasibility of Coconut culture in the United States, and the desire to investigate the subject more closely.

There is hardly a tree or plant more extensively and variously useful than the Coconut Palm. The wood is used in some parts of the world for building purposes, for furniture, and ornaments. It is known in commerce as poreupine wood, and is susceptible of a high polish; the leaves are used for thatching, habitations and other buildings. The husk contains twenty-five per cent fiber, which when separated is used in

acres, with an annual product of about ten thousand millions of nuts. Along the coast of Brazil are Cocoa Palm groves 300 miles in length, whence eight millions of Coconuts are annually sent to the United States, while large quantities come from the West Indies and other countries.

A temperature of from 65° to 90° is required for the best growth of the tree, but it will grow successfully at considerably lower and higher temperature occasionally. It thrives best in porous coral sand, and the more decayed vegetation there is on it the better; the coral or lime soil contains all the requirements needed, and when another is chosen the deficiencies must be supplied. To a clayey soil sand and ashes or lime must be added in large quantities, and even then the trees will not grow nearly so fast, nor will they commence bearing so young or so well as in naturally adapted soil. A location well as in naturally adapted soil. A location along salt water is proved to be the best, the closer the water's edge the better. The most successful groves are in coral formations, situated in or along the track of warm

suitable for Coconut culture in Florida is comparatively small, its favorable soil and location make it as desirable for the purpose as the most favored spots of the tropics, with the additional and inestimable advantage of as healthy a climate as exists in that latitude.

E. T. FIELD.

PACKING AND SHIPMENT OF FRUITS.

BY PARKER EARLE.

In commercial fruit growing the preparation of fruit for the market is of great importance. If we grow merely Apples, Pears and Peaches, it matters little what kind of crates or barrels we ship them in. Suppose, though, that our fruits have been allowed to ripen, have been kept from worms and bugs. In that event the man nearest to a good market is the happiest by far. Any kind of crate will do in such cases. To this class very little need be said. To those, however, who grow fruits at a distance, as the tender berries grown in the South and sent North in February and March, we in the North receive such fruits. These berries are sent

from Florida to New York, Chicago and even to distant Winnipeg. How is this? Such fruit had never been heated; it had been kept in refrigerators all the time from Florida to New York in artificial contrivances, while the natural climate from there on is cold enough to keep what in hot weather would not keep over night.

So, also, with fruits from California. Apricots, Nectarines and Peaches, which are very tender and perishable, come through sound and in good condition. I have seen them as far east as New York and Boston. In the first place the fruits grown in California were carefully cultivated. Owing to climatic causes, they have received no attacks from insects. When nearly ripe they are carefully gathered, wrapped in paper and sent with great care on the journey in various directions. Hence, many fruits which we despair of growing are shipped all over the country from California. Surely we are not making use of transportation and this method of marketing our goods.

A good deal of care must be exerted in packing. The half-bushel drawer used in our country, Ohio and Indiana, is a bad arrangement. No box could be more ingeniously contrived to spoil berries than this one. The boxes are rolled over and over and the berries made to leak. The quart box or baskets packed in an open crate are the best contrivances I know of, especially for good weather or refrigerator cars. I don't mean the Michigan quart box; that is too deep. The measure is accurate, but it don't carry berries as well. When placed in the crates the aggregate box is so nearly square that one cannot tell when it is upside down or right side up. A better crate is one built so as to obviate this trouble.

Raspberries should be shipped in pint boxes packed in cases containing 24 boxes. I have no difficulty in shipping tenderest varieties 600 miles and having them arrive in fairly good shape. This could not be done in large packages.

The crate used in the Eastern States for Peaches is improper. It is ingeniously adapted to spoil fruit. The Delaware Peach basket is too large for shipping ripe Peaches. The Michigan Peach basket is a receptacle of great merit, but is not quite the thing. I would prefer an oblong package like the Michigan Grape basket. This will do for markets near and far.

The so-called "Ripe Fruit Carrier" is the best contrivance for that purpose that I have ever seen. A few days ago I received one of these carriers filled with Peaches picked three days before they reached me. On opening the box and removing the fruit, I found them to be in a state of remarkable preservation. On one or two were slight bruises, which by examination I readily recognized as being made by falling from the tree on which they were grown. On one or two others some traces of earth were visible, showing that they had been picked off the ground. We all admired the Peaches at home, and I have brought three of them over here for the inspection of the gentlemen present. Of course I chose the finest among the smallest Peaches. You see that they are almost perfect. They were picked eleven days ago. (The fruit was examined and found to be remarkably well preserved.)

The box is filled with perforated pasteboard trays, so arranged by divisions that each Peach is in a little cell and entirely separated from contact with the others. The box holds 100 Peaches. The patent is on the ventilation, since the arrangement of trays is not unlike that in the well-known egg carrier. By packing in this way I believe that Peaches could be transported as far as from Michigan to England, and there is no reason why even more remote distances cannot be reached by packing still more securely, as in tissue paper or cotton. The crates cost about 30 cents each.

It seems desirable to me in shipping fruit to avoid express companies, not wholly to save expense, but to avoid the almost universal rough handling and confinement in hot cars. The result of a long experience on my point is to avoid express companies. The Illinois Central R. R. has furnished us with good, well-ventilated cars. I believe they are the best ventilated fruit cars I ever saw. But still it is very hard for us to ship successfully during hot weather. Fruits must be kept cool, not cold, a temperature of about 50°. I have never had any failure in using refrigerator cars. The following conditions are worthy of notice. Don't have your fruit hot when it is put in the car. Have it cool either before or see that it is cooled after put in, but before it goes.—*Read before the American Pomological Society.*

FRUIT GROWING NOT DESIRABLE FOR EVERYBODY.

It is a wise provision that each member of the human family is peculiarly fitted for some specialty. Some of our fellows take pleasure in running engines over iron rails, others in mining coal or iron, others in sailing ships, and others in figuring in offices. There are more who have a taste for horticultural pursuits than for any other calling, but horticulture is divided into many departments, each of which is adapted to the different tastes and peculiarities of individuals. Fruit growing is as different from ordinary farming, as one kind of business in the city is from another. Fruit growing calls into use different abilities than those required for ordinary farming; it requires more business ability, more tact, greater promptness in action, more patience, more perseverance, and a wider range of information.

There has been too much indiscriminate advice to undertake fruit growing, and many who own large farms have attempted to add general fruit growing to their business of farming, dividing their attention between the two pursuits. My experience would not lead me to take such a course as this, for fruit growing demands prompt attention, and either the farming or the fruit growing would in most cases be neglected, perhaps both. More especially is this the case with small fruits, for Strawberries and Raspberries are ready for harvesting at just the time when the grain harvest and haying commences. If you have several acres of Strawberries and Raspberries to market, you have little time to watch the hay fields, or the ripening grain, both of which are exacting upon your time and attention. If the farmer has a son, who will take the entire charge of the fruit department, leaving the father's

hands free to attend to the farming, fruit growing may be conducted successfully on the same farm. Farm work is exacting and demands great attention and diligence, but fruit growing demands far more.

Few farmers are aware of the amount of experience required in farming. They have been born and bred on the farm, and have accumulated information gradually on the subject of the requirements of ordinary crops, the application of fertilizers, and the gathering and storing; and they do not realize how ignorant they would have been on these subjects if called on to manage a farm without having had any experience whatever. Therefore, such men do not appreciate the amount of knowledge necessary in fruit culture. It is a fact, that the experience one has secured in farming is of the greatest help in fruit growing. A good farmer may be said to have about one-half enough experience with which to begin fruit growing. That is, he would have that advantage over a novice who has had no experience in rural affairs. But the best farmer has much to learn before he can grow fruit successfully and without danger of failure.

The first mistake a farmer would make in attempting fruit culture would naturally be in the selection of varieties. It requires the largest experience to know just what to plant in certain localities. If the farmer had some experienced friend in his immediate locality, on whose advice he could rely with confidence, he might be aided in this regard, but usually he does not appreciate his ignorance on the subject, and, relying upon his own judgment, makes serious blunders. It requires considerable experience to be able to decide which field of the farm to devote to certain kinds of fruits. The novice is almost certain to select the wrong field. While an elevated site can almost always be recommended for fruits, the novice will be pretty certain to select low, moist, dark-colored soil in preference to the upland.

It is difficult for the novice to see the importance of giving his plants and trees plenty of room. In planting, he marks out his ground perhaps with an ordinary corn-marker, and as he sets his Raspberries and Blackberries in these rows, it appears to him that three feet and one-half may be ample space. He is not able to look forward in his imagination to the time when each Blackberry and Raspberry row will cover an expanse of four or five feet, thus demanding seven or eight feet space between the rows. It is the same with Grapes, and with fruit trees generally, most beginners planting these too closely together. When I began fruit growing I made the same blunders. I remember in planting black Raspberries seven feet apart, it seemed to me that there was too much waste ground between the rows, and having some Pear stock which I desired to feed, I foolishly planted them between the rows of Raspberries. All went very well the first year, but the second I could scarcely see my Pear seedlings. By great perseverance in shortening in the Raspberries, I succeeded in getting a fair stand of Pears, but it was a foolish operation. The wiser course would have been to have left the vacant row between the Raspberries unplanted, or planted to early Potatoes or a similar crop. Small fruit growing is specially desirable

for the man who has only a few acres of ground. There are many people who have only from one to ten acres; and who have no money to buy more land, but who have made the most of what they have. Such persons cannot do better than to occupy the ground entirely with Strawberries, Raspberries or Blackberries, making the land very rich. Usually there are children to help gather the fruit, and the labor can be largely performed by the owner, if he has no other business to occupy his attention. The best success is usually seen by persons of this class, all the proceeds appearing to count as profit, as they incur no outside expenditure. Not having a large amount of any species of fruit they dispose of it all, they can pick in the best possible condition, and get the highest prices, thus competing successfully with the large grower, and often making more money than the latter. Strawberries especially I consider the poor man's berry, from the fact that any poor man who has from a quarter to an acre of soil, may by industry and skill grow enough fruit to assist materially in maintaining himself and family.

CHARLES A. GREEN.

Rochester, N. Y.

UNDERDRAINAGE.

Underdrainage may be a good thing for the market gardener, but it is of doubtful value to the fruit grower; and notwithstanding the claims made for it, the natural drainage of a high, rolling spot should always be preferred.

Underdrainage equalizes the amount of moisture in the ground. If there is an excess, the drains carry it off; while they have such an effect upon the soil that it retains more moisture in a dry time. Hence underdrainage indirectly reduces drought and directly reduces excessive moisture. It follows that it makes more equable the temperature of the soil. Water is of a more equable temperature than earth, receiving heat more slowly and giving it off less readily. Hence whatever equalizes the water in the ground also makes more equable the temperature of the ground. So far underdrainage is beneficial to plant growth. It is beneficial, also, by reason of the effect it has upon the soil—deepening it and fining it, thus increasing the amount of plant food and making it more readily available. The well-known effect of underdrainage upon the season of growth—to begin earlier in the spring and continue later in the fall, and caused by the change made in the texture, temperature and humidity of the ground and therefore in the temperature and humidity of the air above this ground—is also favorable to greater yields.

Taking up the effects of underdrainage one by one, it is easy to see that they may be of benefit to the gardener, and impossible to reasonably suppose that, save in exceptional cases, they would do him hurt. A respectable part of the profit of gardening depends upon early growth, since the vegetables first in the market are the ones which bring the highest prices; and the ability to prolong the growing season is of scarcely less advantage. Other conditions being the same, the gardener who has underdrained his land will make more money than the one who has not, for he can not only grow more,

but he can get his early vegetables earlier to market, and keep the market supplied to a later date in the fall. Though the gardener have high ground, the natural drainage of which is excellent, he will very likely find underdrainage profitable; for it will deepen the soil and improve its texture, lengthen the growing season and make it productive of better results, and mitigate drought, though there is no need of it to carry off an excess of water. The gardener should never forget that underdrainage mitigates drought as well as flood. This fact is too often overlooked by many who suppose that the effect of drains upon the soil is only to carry off a surplus. They retain moisture in a droughty period as well.

But it is certain that underdrainage does not do so much for the fruit grower as it does for the gardener, and it may well be doubted if it is of any real benefit to the pomologist at all. In so much as it improves the condition of the soil and makes its plant food more readily available, and so far as it makes the seasons more favorable to growth, it is of undoubted benefit; and, unless the matter were considered in all its phases, a person would be led to suppose that its effect upon the temperature and humidity of the soil and air would be a great benefit to the fruit grower. But a little investigation will show that instead of this being a benefit it is a positive injury. We see that one result of it is to lengthen the growing season by making it begin earlier in the spring and continue till later in the fall. It affects to a certain extent the temperature locally, keeping off frosts later, but it cannot have any appreciable effect upon strong tendencies to change on the part of the air, nor can it ward off those cold waves which lower the temperature 30° or 50° in a few hours.

What is the result? The fruit trees, berry canes, and Grape vines are coaxed to grow till late in the fall; they are full of sap, and tender; and they are caught by a cold wave and injured far more than they would have been had their growth declined earlier. In all parts of the country great damage is done to fruit trees, shrubs and vines, by the growing season being terminated by sudden and severe cold. In the West, at least, this destroys more fruit trees than all other causes combined. There is so much sap in the trees that its expansion by freezing bursts the bark loose from the trunk and larger branches, and in some cases splits the trunk. Underdrainage, by coaxing the trees to grow later in the fall and yet being unable to ward off cold waves, increases the evil; and this alone would make underdrainage of doubtful value in many localities.

Again, our fruit crops are frequently destroyed by hard frosts after the leaf and fruit buds have swelled and perhaps opened. The local temperature has been warm enough to coax the buds to expand and then a cold wave destroys them. Underdrainage by coaxing the buds to waken earlier in the spring, would increase the chances of the loss of the fruit crop. Underdrainage not only threatens the trees, but their fruitfulness also after they have passed through the winter. And because of this I think the fruit grower (for this applies to vines and shrubs as well as to trees) would better depend upon the natural drainage of high land.

Such land will be more free from frost than low land well underdrained; and upon it the trees are not led to grow too late in the fall or to begin growth too early in the spring.

JOHN M. STAHL.

THE LARGEST GRAPEVINE.

Though the largest Grapevine in the world is claimed to be at Hampton Court, England (a *vitis* variety), and another is claimed by Santa Barbara, Cal. (a Mission Grapevine), yet I believe the farm of Jesse Tarlton, seven miles from Lexington, Ky., has the best right to the honor of possessing the largest Grapevine, at least in size of body. I measured it at six feet from the ground and found it 66 inches in circumference. It is of the *cordifolia* (Frost or Winter Grape) species, and is probably 200 or more years old. It is supported by an Elm nearly three feet in diameter, which it entirely covers, and shows vigorous growth in many branches, though partly dead on one side near the ground, caused by exposure to the sun and trampling of stock.

A vine of the same species, reported in newspapers of Fla. a few years ago, having a circumference of 69 inches, has always been regarded by botanists as a "fish story," so Kentucky must now bear the palm till good authority from elsewhere shows a circumference of body over 66 inches, six feet or more from the ground.

T. V. MUNSON.

NORTHERN EXTENSION OF VITIS AESTIVALIS.

During my recent visit to Kentucky and Michigan, writes Prof. T. V. Munson of Denison, Texas, I found that the *aestivalis* species of Grapes—of which Norton's Virginia is an example—extends to about 45° in Michigan, which is some 3° or 4° further north than in any other section known, and hence the early ripening varieties of this species, of which several fine ones have recently been found, are likely to succeed well in Michigan.

It also appears that in a limited section near Lake Michigan, in Michigan, the *Labrusca* species has been found native, the only place west of the Alleghanies.

SHORT CUTTINGS.

Rot has destroyed the greater part of the Kelly Island Grape crop this year.

Cranberries are a short crop this year. In Burlington and Ocean Counties, the great Cranberry center of New Jersey, the fruit is badly scalded, and the yield will not be over twenty per cent of the average.

The largest Orange trees found in Florida are in Hillsborough, and are said to have been planted by settlers who took advantage of what was known as the "armed occupation" laws. Some of these trees have for years produced 10,000 Oranges.

The climate of Washington Territory offers excellent facilities for fruit growing. Some specimens of Early Crawford Peaches received from C. W. Shane, Toledo, Wash. T., were as fine as any we ever saw of this variety.

Vegetables.

SEASONABLE HINTS.

Harvesting crops that may still be in the ground, gathering decaying vines and rubbish, raking up leaves, bringing under shelter Bean poles and Pea brush, and cleaning and tidying the grounds generally, are now in order. But nothing adds so much to the neat appearance of a garden during winter than to have it plowed or spaded up before the ground freezes.

Fall Plowing not only improves the appearance of a garden, but it ameliorates the ground materially, and fits it for earlier cultivation in spring. For the amount of labor and expense devoted to it, hardly anything brings so great a return as fall plowing or spading, especially on heavy or wet soils.

No implement can mellow and pulverize the earth nearly as thoroughly as frost does; and if the plowing is done in narrow lands, with deep, open, intervening furrows running with the slope of the land—as it should be whenever practicable—the additional benefit derived from surface drainage is of no small account.

Parsnips and *Salsify* not required for winter use may be left in the ground without injury, yet in the Northern States a light covering of leaves or stalks will generally preserve them in better condition. Where no suitable winter storage can be had, a part of the row or bed may be covered thick enough to exclude frost, thus enabling one to dig the roots at any time.

Improving Varieties.—"Plant the most mature and perfect seeds of the most hardy, vigorous, and valuable varieties," has been President Marshall P. Wilder's injunction for many years, in regard to the improvement of fruits. It applies with equal force to the improvement of vegetables, as instanced by the following experiment:

Last fall we selected seed of Caseknife Beans from pods having six or more seeds in each pod. This year the crop showed a marked improvement, six, seven and eight-seeded pods being common. The selection has now been made from pods having not less than eight seeds, nine-seeded pods appearing frequently.

Keeping Onions.—The principal requisition for keeping Onions in good condition during winter is dryness. If kept in a dry place, they are not easily injured by frost, provided they are not handled while frozen. Packed in barrels with any kind of chaff, or finely cut straw, they will winter safely in a barn or any out-building. Ordinary cellars are too damp for Onions.

Asparagus stalks should now be cut off and burned, and a liberal coat of manure be spread over the rows. Manuring at this season has a much better effect upon next year's crop than if deferred till spring. The same applies to Rhubarb.

Cold-frames should be covered only during freezing weather. The principal cause of non-success with cold-frames lies in their being kept too much closed.

Cabbages keep better if not pulled till cold weather sets in, but care should be taken to prevent their becoming frozen hard, as this injures their keeping quality considerably. Market gardeners keep them out-doors, covered with soil.

MARKET GARDENING IN THE SOUTH.

History.—Social Questions Involved.—Growth.—Locations.—Soils.—Methods.—How to Grow the Different Crops.—Some Great Successes.—Causes of Failure.

BY DR. A. OEMLER.

PRESIDENT CHATHAM COUNTY TRUCK FARMERS' ASSOCIATION.

First Paper.

About the year 1840, the Hon. Mark A. Cooper and Dr. W. C. Daniell of Savannah, imported each a German to manage their private gardens. As soon as the latter (George Ott and Nicholas Wolff) learned to appreciate their capabilities and the opportunities presented by their new surroundings, they left their employers, located in the immediate vicinity of Savannah, and engaged in the cultivation of vegetables for the local market. In so far as Savannah is concerned they were the pioneers in truck farming. Both acquired competencies. The former died in Savannah years after he had retired from active work, while the latter still lives in comfort at Wiesbaden, Germany.

Previous to 1856, when, abandoning the practice of medicine, the writer commenced truck farming, no crops except Watermelons were exclusively planted for the northern markets. Small shipments were made, however, of the surplus of the local market crops. Nor had any large consignments of Melons ever been made, nor a crop ever been grown in Georgia, nor probably elsewhere at the South, expressly for northern markets prior to 1852. A few may occasionally have been sent to New York by fruit dealers, to fill orders.

In 1851, Mr. E. B. Barstow of Wilmington Island, placed on board the packet barque, Isaac Mead, about fifty fine Melons for the consumption of a party of our relatives during the voyage to New York. Only a few of them having been used during the quick trip, the balance were presented to the captain, who sold them at such high prices, that Mr. Barstow, induced by the evident demand, planted the first crop for shipment in 1852. Notwithstanding many drawbacks, the venture resulted so satisfactorily that two other Sea Island Cotton planters, R. T. Gibson and W. R. Pritchard, of the neighboring islands of Whitmarsh and Skidaway, respectively, were tempted to follow suit the next season. Outrageous stealages in transit (not yet even completely abated on some transportation lines) made it advisable to entrust the shipments to the care and custody of captains, or persons who disposed of them for one-half the net proceeds. When communication with the North was interrupted at the commencement of the war, W. R. Pritchard had 60 acres in Melons.

General shipment of vegetables increased annually, but the truck interest could never have reached its present importance, but for the result of the war. Emancipation, or the death of slavery, has certainly been, so to say, the birth of truck farming on an extensive scale along the South-Atlantic and Gulf coasts.

Under the old order of things large truck crops would have been impossible, as one of the chief requisites to the successful pursuit of this industry, is proximity to the point of shipment and source of manure supply, or the vicinity of the larger coast cities. Several

farmers near Savannah employ one or two hundred hands during the picking season. J. R. Young had 150 acres in Strawberries near Norfolk, Va., in 1879 and employed about 1000 hands during the harvest. He put in an additional 100 acres the following year. From 4000 to 5000 bushels were then being daily picked in the neighborhood of Norfolk, and as each picker averaged about one bushel, it follows that a force of from 4000 to 5000 hands was required to gather the fruit.

The only plantations in the vicinity of Savannah with large labor forces, were those of the River Rice planters and none of the negroes could ever have been hired. I was the largest slave-owner engaged in vegetable growing, and at no time could I have made available for field labor more than twenty-six adults, the remaining forty being children or mechanics and house servants. Ex-Governor Hammond's prediction, that "in case of emancipation the negroes would seek the towns, and rapidly accumulate in groups upon their outskirts," has certainly been verified, and it is the better element of this population which is willing to do some work, and supplies the truck farmers with the necessary labor during the busy season of gathering their crops.

This industry has gradually developed into astonishing proportions, especially in the vicinity of the larger seaport cities of the South. Where favorable conditions are wanting it is pursued less successfully, and with a more limited variety of products, as is the case inland along railroads and in Florida. Market gardening affords support, and in not a few cases more than a mere competency, to many farmers along the South-Atlantic and Gulf coasts from Norfolk to Mobile, and furnishes sustenance to a population that would otherwise either starve or starve.

During that period of the year when the planter is often without ready cash, many of those along the railroads, who cultivate Melons, or other truck, as an adjunct to their cotton crops, rejoice over the net proceeds of their shipments, although these would be quite unsatisfactory to the special truck farmer. During the season of business stagnation at the South, the movement of their truck crops, and the inflow of money in return, tends in the early spring and summer to enliven southern coast cities. Finally the income resulting therefrom to the various transportation companies, on land and sea, is of very great importance at a season when other freight would not pay the expenses of their northward trips.

Chatham Co., Georgia.

A SECOND CROP OF PEAS.

My American Wonder Peas have excelled themselves this year, yielding two very good crops. I have often noticed—as I suppose others have done—that soon after picking the green pods from the vines, a new growth would start from near the roots, produce blossoms, but seldom pods fit for use. The plant becomes so exhausted in the effort to produce another crop that, unless special stimulants are given, it dies in the effort. This suggested the idea that under favorable conditions and proper care a second crop might be grown profitably, and this year's experience confirmed the correctness of the supposition, to our great pleasure.

Early in spring American Wonder Peas had been sown along side of a furrow in which a good quantity of yard manure was buried. Soon after the first crop had been gathered, which was a very good one, we had abundant showers; new, vigorous branches appeared almost immediately and produced an abundance of blossoms and Peas, more I thought than the first crop. The pods were generally smaller, and the number of seeds in them less than in the first picking, nevertheless I harvested three bushels of good seed Peas from this second growth. In this case all conditions seemed to have been favorable, and new roots have probably pushed forth into the near-by manure, but I have no doubt that even under ordinary circumstances, liberal applications of liquid manure at the proper time would produce similar results.

I. I. SEYMOUR.

EARLY NEW ZEALAND POTATO.

The specimens of this new Potato sent us, and from the most characteristic of which our illustration was drawn, were large, handsome tubers of oblong-oval, flattened shape; skin light pink, roughish; eyes even with the surface, or slightly raised, never deepened. Even the largest specimens were solid to the core and of the best cooking quality.

This variety, the introducer states, originated on the island of New Zealand and was introduced into the United States in 1882; its growth of vines is strong and vigorous, foliage large and dark green; blossoms abundant; season extra early, keeping quality unexcelled, and its yield immense. He lays special stress upon the importance of planting single eye sets.

THE DEACON LETTUCE.

In the August number of THE AMERICAN GARDEN, "Elm" of the New York Experiment Station gives a very interesting account of the experiments made at the Station with 150 varieties of Lettuce. At the head of the list he places "The Deacon."

"All in all," he says, "this is the finest heading variety we have grown. Introduced by Joseph Harris. This is one of the dark-green, thick-leaved sorts. Nearly all of them are of good quality. Head compact, rounded or a little flattened when of full size and in some plats measuring full five inches in diameter. Outer leaves few in number, which with the perfectly defined head, give the plant a very distinct appearance."

This is an accurate description of the Lettuce under consideration.

"I have been surprised," he adds, "that this superior variety has not appeared under any other name."

The history of this Lettuce is as follows:

Living near me on a small farm is Mrs. Müller. For many years she and her husband were successful market gardeners in the Irondequoit, southeast of Rochester. The family moved into my neighborhood. The husband died, and my good friend and next door neighbor, Deacon Bushnell, was

able to aid the widow in settling up affairs and saving the farm.

Mrs. Müller was grateful.

She had a variety of Lettuce the seed of which she would neither sell nor give away. As she passed by the deacon's farm on her way to the city with vegetables, she would leave him a head of this Lettuce and finally gave him some seed.

There is nothing that pleases the deacon better than to beat me and then laugh at people who write for the papers.

The deacon often told me about the wonderful Lettuce that Mrs. Müller grew. I confess to have had little faith in it. It did not seem probable, I thought, that a woman living out here in the country on a cross-road, working her small farm and garden with her own hands and taking her vegetables to market and peddling them out in the city, should have a variety of Lettuce better than could be got from Vilmorin of Paris, Benary of Erfurt or the Carters of London. We had the best varieties of the best seed houses in the world, and it was not likely that Mrs. Müller could have anything that was superior.

"Well," said the deacon. "have it your own say."

EARLY NEW ZEALAND POTATO.

I had my own say. We sowed many different varieties of Lettuce,—French, German, English and American, but the deacon beat me every time. Finally Mrs. Müller let me have a few ounces of seed, and then, by the aid of plats of manure and superphosphate, sowing in rows 21 inches apart, and thinning out the plants six or seven inches apart in the row, I beat the deacon.

I have grown this Lettuce and sold the seed for several years. But so far as I can remember, the article by "Elm" in THE AMERICAN GARDEN is the first notice it has received from any agricultural or horticultural paper.

I have just been to see Mrs. Müller. I found her and her daughter digging Potatoes. I told her that the New York Experiment Station had tried her Lettuce, and out of 150 varieties with 700 different names, her Lettuce proved to be the best, and I wanted her to tell me all about it.

Ques. How long have you grown it?

Ans. Over forty years. I am an old woman, I shall soon be seventy. I want to make a good deal of money out of this Lettuce, but I cannot get about as I used to.

Ques. Where did you get it from?

Ans. A French lady from the place where I came from, near Strassburg, brought me some seed. Strassburg is in Germany now; but I do not care. This is my country.

Ques. And you sowed the seed and found it good?

Ans. Yes.

Ques. Why is it so good?

Ans. Because it is.

Ques. I mean, why is it better than other Lettuce?

Ans. It is sweet and tender and always makes a head even on poor soil. But the richer the soil the better, and you do not sow it too thick and you should sow it early.

"Yes," said the daughter, "last year mother was cleaning the seed in the water and threw the chaff on the snow, and in the spring when the snow went off the Lettuce plants came up."

Ques. Cannot you tell me something more about it? Did the French lady tell you its name?

Ans. No. I have told you all there is to tell about it.

Ques. You have grown this same Lettuce ever since the French lady gave it you forty years ago. How did you manage to keep it?

Ans. (Smiling at my simplicity.) I raised seed myself. I left some of the very best heads every year for seed. And the people in Irondequoit wanted us to try some other kind. I saved the seed in another part of the garden. You know Lettuce will mix. I never found any other Lettuce as good as mine and I always grow the seed apart by itself.

Ques. How do you manage to grow the seed? I can't make it go to seed.

Ans. Some seasons you can't get any seed. But it will keep for many years and the old seed is just as good.

Ques. Do you do anything to make it go to seed?

Ans. Nothing except to select the best heads and then break off the lower leaves and open out the head.

I imagine that this last suggestion is valuable for general adoption.

1st.—It seems clear that this so-called "Deacon Lettuce" was a good variety to start with, or the French lady would not have thought it worth while to have brought it to this country.

2d.—That Mrs. Müller by keeping it firm and by continuing selecting the best heads has made it what it is.

3d.—It is not any better than it should be. It is good, or as "Elm" says, "the finest heading variety we have grown," because nearly all our Lettuces are so poor. I have often said that they are a disgrace to seed growers and seed sellers. And they will continue to be so till we adopt Mrs. Müller's method of selecting the best heads for seed.

JOSEPH HARRIS.

The Sweet Potato crop has suffered from drought in many localities, especially in the Southwestern and some Western States, while in parts of New Jersey it is reported as the best in ten years.

PRESERVING WATERMELONS AND SQUASHES.

It is not generally known that Watermelons may be kept in good condition until near Christmas; yet it can easily be done. I have often kept them until after Thanksgiving day, and had I started with a sufficient quantity, or had I been more frugal in their use, could, I am confident, have carried them up to Christmas. The trouble was, that they kept so well that we couldn't keep them long enough. It is as hard to keep Melons—from being eaten—as it is to keep a row of Peas for seed from the earliest ripened patch.

The method of preserving Melons is very simple indeed. A big box or bin in a cool corner of the woodshed, or in a tolerably dry cellar, is the first requirement; a plentiful supply of Oats, bran, sawdust or some such dry, light substance, the next; a layer of a few inches of this is put in the bottom of the box, and then as many Melons laid in as can be without bringing them any nearer together than three or four inches, keeping them away from the sides of the box about the same distance. The bran or other material used must then be sprinkled in among the Melons until all the spaces are filled, and another layer of three or four inches spread over the whole. This is continued until the box is filled.

The Melons should be picked for this purpose before they are fairly ripe. Late in the Melon season when frost threatens, the greener ones may be treated in this way, and thus saved from destruction and to serve as an unaccustomed luxury in wintry weather.

Squashes for late keeping must not be bruised in handling. Too often they are pitched into the wagon-box or rack at a good, long throw, so that every one of them is badly bruised. Wherever bruised they will rot, and that quickly. Freezing, however slight, is also fatal to them. Some growers leave their Squashes on the vines until frost cuts down the top leaves so that they can readily be seen and gathered, but such frost is pretty likely to touch the top sides of the Squashes also, and whenever so touched they will soon rot. They should be gathered as soon as the greater part of them are fairly ripe, and when growing near the cellar where they are to be stored, they may easily be hauled in on a stone-boat with side boards attached. The Squashes if picked and laid carefully on this conveyance will not be in danger of becoming bruised. Small loads must necessarily be taken in this manner, but the time thus consumed will be amply compensated for by the extra keeping quality of the Squashes.

Never should Squashes be piled up in huge heaps in the cellar as is often done, as it is sure to cause early and general decay of the whole mass. It is bad enough to store any vegetables in this way, but to the Squash it is certain destruction. It will require but little more space and a few feet of lumber to change the bin into a number of broad shelves where each Squash will have to bear only its own weight, and decay of one will not materially affect the others. Squashes are usually a salable market article in winter, and even if no better use could be made of them than to feed to stock, they are worth the little care necessary to preserve them.

W. D. BOYNTON.

GARDEN PEPPERS.

The Pepper is one of the most valuable of our garden plants. In our experience, it is seldom that we find filthy plants grown from the same sample of seed that are alike in their foliage and fruit. The flowers are very subject to cross-fertilization, and unless the different varieties are carefully separated, the seeds will not reproduce their kind. But all the variations that occur do not appear to be the result of cross-fertilization. For example, certain plants of a variety often bear their fruit upright, while all the others have pendant fruits, the plants showing no other differences.

During the past four years, several new names have been added to our list of Peppers, but most of these are new in nothing except their names. I will mention a few of these newer synonyms, and append a brief description of the varieties to which they belong, and of a few other sorts.

Monstrous, or Grossum. This does not appear to be an old variety, at least Mr. Burr, who wrote in 1865, does not mention it; yet if the seeds we have planted have been true to their names, we have grown this Pepper under the following appellations: "Monstrous or Grossum" (Thorburn & Co., 1882), "Spanish Mammoth," and "Monstrous" (Vilmorin, 1884). "Ruby King" (Benson Maule & Co., 1884), "Crimson Queen" (Tillinghast, 1885). The plant of this variety is one and a half to two feet high, leaves very large, the larger ones sometimes four inches long, and more than two inches wide. The borders of the leaves are a little undulate, and the edges are usually curved upward. Their surface is generally somewhat blistered. The stem is usually tinged purple at the nodes. The fruits are pendant, irregularly conical, generally a little curved, terminating in an obtuse point, about five inches long, and two inches in their largest diameter. The color when ripe is brilliant coral red. It is a sweet Pepper, and has very little of the true Pepper taste. In season it is rather late.

Sweet Spanish. This old variety was offered by Mr. Everitt last spring under the name "Red Prince." The plant resembles in general appearance that of the one just described. The fruit is shorter, and very blunt at the apex, where it usually ends with three or four rounded protuberances. Sometimes, however, it ends in a blunt point. It is considerably earlier than the Monstrous or Grossum, and is equal to it in sweetness.

Sweet Golden Dawn. This variety we believe was first offered by Messrs. Thorburn & Co. in 1883, and was last spring sold by Mr. Everitt as "Buttercup." As I find no record in the older books of a yellow Pepper answering to the description of this one, I conclude that it is truly a new variety, and it is perhaps the most valuable new Pepper that has been offered in many years. It has the remarkable quality of being so mild in taste, that it may be eaten like an Apple without the slightest inconvenience. Even the seeds are free from any pungent quality. The plant is 12 to 18 inches high, with foliage resembling that of the varieties named above. The stem is a little angular, of the same color as the foliage. The fruits somewhat resemble in form those of the Sweet Spanish, but they are usually rather more

conical, and more ribbed.

Large Bell. This Pepper, which is known also as the Bull-Nose, Sweet Mountain and Mammoth, is one of the oldest and best known of the sweet Peppers. It is early and of excellent quality. I do not know that any of the more recently introduced red varieties are much superior to it. In some seasons I have thought that its fruits rotted worse than those of most of the other sweet Peppers, but this may have been accidental. The plant resembles that of the Monstrous or Grossum, while its fruit is very similar to that of the Sweet Golden Dawn, except in its color, which is glossy, coral red.

Chili Pepper. This variety is quite distinct from all that I have described above. The plant is low and spreading, the leaves are narrow, smooth and very numerous. The fruits, which on some plants are erect and on others pendant, are conical and but two or two and one-half inches long and about one-half an inch in diameter; it is red in color and extremely pungent in taste.

Cherry Pepper. The foliage of this variety is rather intermediate between that of the Chili Pepper and the sorts described above. The fruit is about the size of the largest Cherries, generally round though sometimes pointed and occasionally oblate. It is red and very pungent in taste.

Ox Heart: called also "New Ox Heart." This variety resembles the Cherry Pepper in foliage and fruits except that the latter are about twice as large.

Cranberry Pepper. In habit and foliage this variety resembles the Chili Pepper, but is more dwarf. The fruit, which is round and extremely pungent, is scarcely larger than the common Cranberry.

Cayenne Pepper. I am somewhat perplexed in regard to this variety. Both Vilmorin and Burr expressly state that the Cayenne Pepper of commerce is the product of a plant belonging to a distinct species from that of our garden Pepper, and which will not endure our climate. Yet nearly all our catalogues mention this sort, and often the word "true" is appended to the name. I have grown three different Peppers under the name Cayenne, but surely none of these was sufficiently distinct from our other garden Peppers to belong to a different species.

"ELM."

FRESH SPROUTS.

Sowing Onions in autumn is gaining in favor with gardeners. To meet with success in this way the soil must be dry, and in the very best condition possible, and the bed should receive a light covering during winter.

Celery is becoming one of the leading crops of Michigan. Last season \$165,000 were realized by the growers near Kalamazoo alone, while at Jackson and other localities the area of Celery growing is rapidly increasing.

Parsley is a very convenient thing to have in the house during winter. It makes a pretty garnishing and adds a brisk flavor to many dishes. By planting a few roots in flower pots or boxes, and keeping them in a sunny window, "greens" may be picked from them all winter.

Flowers.

THE FLOWER GARDEN IN NOVEMBER.
WINTER PROTECTION.

Again the leaves begin to fade, foretelling the approach of winter. What a grand protective carpet these leaves make for the comfort of our beautiful native flowers during the severe cold. Many herbaceous plants would succumb to the severity of our winters were it not for the covering of leaves they get in the fall. The herbaceous plants under cultivation in our flower-beds and borders are also much benefited with a similar covering; even the hardiest of them flower better the following season by being so protected. If leaves cannot be had conveniently, use coarse litter instead, and do not put it on until the ground is beginning to harden with frost, which is generally after the middle of the month.

TIDYING.

Remove the dead stems from the herbaceous plants, pull out Geraniums and other tender plants which have been killed by frost, rake up fallen leaves, gather all and place in a heap to decay; when thoroughly decomposed they make an excellent compost for manuring flower-beds, and for topdressing the lawn.

IMPROVING THE SOIL.

Digging up and manuring flower-beds and borders in late autumn, brings them in better condition for the growth of plants the following season, facilitates spring work and makes the surroundings more neat and attractive during winter.

Beds of a stiff and clayey nature are often much benefited by an application of good, sharp sand well mixed with the soil. Sand renders the soil easier to work, makes the plants start into growth quicker and to produce a greater abundance of flowers.

It is not advisable to make flower-beds too rich, as this is apt to encourage a too succulent growth at the expense of flowers. Leaf mould makes the best material for fertilizing flower-beds; when this cannot be had, use thoroughly decayed barnyard manure instead.

PROTECTING ROSES.

All Roses should be protected during winter by giving them as soon as the ground is frozen a good mulching of leaves or any other suitable material. The more tender of the hardy sorts should be wrapped with straw, or sheltered with evergreen boughs. If none of these materials are handy, bend the plants down and cover with two or three inches of soil.

ARRANGEMENT OF ROSES.

Nothing looks more attractive on the lawn than a bed of different kinds of hardy Roses, harmoniously arranged, allowed to make a good start, and then pegged down to the surface of the ground. Under this mode of treatment a more abundant supply of flowers is obtained, the flowers appear to better advantage, and the plants look much better during the winter season. A light covering of leaves, straw or evergreen boughs may easily be placed over them, and in the spring they will start evenly and vigorously.

PREPARING A ROSE BED.

North of New York it is not advisable to plant out a Rose bed in the fall, but fall is

the best time to make the bed ready for spring planting. See that the ground is either naturally or artificially drained, dig it two spadings deep, and to this depth thoroughly incorporate with the soil well-rotted cow manure and a good sprinkling of ground bone. After the bed is finished, cover with about six inches of manure which is to remain until spring.

Planted in spring, a fine display of blossoms may be obtained the first year, if good, strong one or two-year-old plants can be obtained. Some of our choicest kinds are so weak growers that it is necessary to work them on strong stock in order to induce a vigorous growth, but inexperienced growers should plant only Roses that are on their own roots; from them there is no danger of suckers coming up and taking all the strength from the flowering shoots.

COLD FRAMES.

Frames containing Pansies, Daisies, Forget-me-nots, *Phlox Drummondii*, etc., should be banked up and placed in a condition so that in case of a sudden cold snap, the sashes can be put on, and the plants protected against a severe freeze, which often happens this month. If mild weather follows a cold snap, always give all the ventilation possible, as upon this depends to a great extent the safe wintering of such plants.

THE SOUTHERN RED LILY.

Lilium Catesbei.

"Americans pass over with neglect what Europeans seek after eagerly, and pay high prices for," I noticed recently in some journal. This is no doubt true with many of our beautiful native plants, and especially so with our lovely Southern Lily, which until quite lately was not to be found in any of our collections, while in England it is highly prized, and classed with the most expensive kinds, and considered worthy of a prominent place in the choicest collections.

Seeing an illustration of this Lily, and being desirous of obtaining a bulb, I wrote to every name and address I could secure in localities where it was likely to grow. I succeeded beyond my wildest hopes, securing not only many bulbs of it, but hundreds of others, from Maine to California; but my patriotism makes me prouder of this wildling of my fair South-land than all the rest.

Catesby's Lily has deep scarlet open-bell-shaped flowers, borne solitary on upright stems 18 to 20 inches high. The long-elated sepals are wavy on the margin, recurved on the summit, and spotted with dark purple and yellow inside; leaves linear-lanceolate, scattered, the lower ones clustered close to the ground. The bulbs are small but exceedingly floriferous.

The whole appearance of the plant is delicate and pleasing, and although growing wild in the pine-barrens of the South it is highly amenable to cultivation, and will surely please anyone who will give it a place in his collection of Lilies.

Mrs. J. S. R. THOMSON.

South Carolina.

A dry, frost-proof cellar is an excellent place for wintering many large, hard-wooded plants, also Cactuses, Yuccas, Century plants, and nearly all kinds of summer-flowering bulbs.

NEW ROSES.

The vicinity of the city of Lyons in France enjoys one of the most favorable climates for the cultivation of Roses in the world. The seeds ripen completely in the open ground, and furnish therefore the best conditions for the raising of new varieties, for which this locality has long been considered headquarters. Still some excellent varieties have been produced by Lévêque & Margottin near Paris, by George Paul and Wm. Paul near London, and especially by Henry Bennett, the originator of the celebrated Bennett Rose.

After new varieties have been sufficiently tested, and are found worthy of dissemination, they are propagated by budding of dormant buds on the collar of one-year-old seedling briars. They are then cultivated one year in the open ground so as to form strong, healthy plants which will stand transportation well and are suitable for immediate planting out or forcing. The following are the best new Roses raised in Lyons to be sent out 1st November, 1885.

TEAS.

Marquise de Vivens (Dubreuil).—Beautifully shaped large buds, very bright, dark Rose, edged yellowish white; outside of the petals white, slightly yellowish; semi-double; only very fine in buds before expanding.

Comtesse de Friguense (Guillot).—Very fine shape, medium size, nearly full, free bloomer; very bright, pure yellow.

Souvenir de Helene Lambert (Gonod).—Yellowish pink, center darker, medium size, full.

Souvenir de l'Admiral Courbet (Peponet).—Medium size, nearly full, dark Rose, not very vigorous.

Madame David (Pernet).—Flowers large, nearly full, delicate Rose, sometimes shaded light salmon, edged white; vigorous.

Edward de Banzat (Levet).—Flowers large, full, fine globular shape, light, vivid pink.

Claudius Levet (Levet).—Flowers large, carmine rose, edged darker, center slightly yellowish; vigorous.

Marguerite Hamet (Levet).—Flowers large, full, fine shade; very fine, vivid rose, center lighter, slightly shaded, light carmine; vigorous, free bloomer.

HYBRID PERPETUALS.

Rosieriste Chantvy (Gonod).—Flowers large, full, fine globular shape, light, bright crimson.

Souvenir de Victor Hugo (Pernet).—Flowers large, nearly full, globular, brilliant light rose; vigorous; free bloomer.

Clara Cochet (Lacharme).—Flowers extra large, fine, globular shape, full; very brilliant, light rose; center darker.

PERPETUAL POLYANTHA.

Floribunda (Dubreuil).—Dwarf; flower size of those of Anne Marie de Montravel, delicate rose, shaded white; very full, large trusses, abundant bloomer, very hardy.

Max. Singer (Lacharme).—Very vigorous; sarmentose like the type; flowers large for the species; size of those of He Bourbon Hermosa; bright, dark, cherry red or bright, light crimson; very free bloomer. JEAN SISLEY.

Montplaisir, Lyons, France.

Soil for hot-beds to be made early in spring should be thrown in heaps and covered with old boards before the ground freezes too deep. Or if a sufficient quantity can be brought under a shed, this answers the purpose still better.

According to the computation of the botanist of the Ohio Agricultural Experiment Station a "Pusley" plant matures about 400,000 seeds. Moral: Don't let Pusley go to seed. It is quickly killed by piling in heaps.

THE CHRYSANTHEMUM.

Chrysanthemum Sinense.

In the "long ago," when I was a boy, there was a popular plant, grown in almost every garden, and known by the name of the *Artemisia*, and it is still known only by that name by a good many people. I allude to the *Chrysanthemum Sinense* and its many varieties. A good many of our country cousins would not even to-day know what you meant if you should talk to them about Chrysanthemums; and I am very sure, on the other hand, that many of our younger flower lovers would understand just as little what you meant if you should talk to them about the old garden *Artemisias*. It is well to know, therefore, that the *Chrysanthemum* and the old garden *Artemisia* are one and the same plant. Taking all things into consideration, I doubt very much whether the *Chrysanthemum* is to-day more popular than the garden *Artemisia* was forty years ago.

Some marked improvements, however, have been made in the *Chrysanthemum* in a certain direction, and the varieties have been wonderfully increased. Some of the old kinds are still held by connoisseurs to be among the best in their classes, and it would be difficult to find a prize stand at English shows that did not contain such charming old varieties as *Cedo Nulli*, *Bob*, and others I might name. The old kinds are, on the whole, a hardier race than the new generation; a good deal of hardiness having been sacrificed to variety.

The *Chrysanthemum* is now divided primarily into two classes, the Chinese and the Japanese. The Chinese are divided, again, into sub-classes, such as large-flowered, pomponne, (small-flowered,) incurved, anemone-flowered, and so on: and recently the Chinese and the Japanese classes have been crossed, and the result is a "mixture" that sets all laws of classification at defiance.

The typical Japanese varieties are singularly grotesque and unique, yet very beautiful, with long, narrow petals and bright colors, the most characteristic form having been well likened to a pin-wheel in motion. While the Chinese forms are symmetrical, the Japanese make fancy work of symmetry. The accompanying illustrations give a good portrait of each form.

The length allotted to this article will not permit of the details of culture as the *Chrysanthemum* is now grown. To do this in a satisfactory manner would require at least a page. I will therefore give a list of some choice kinds, supplemented with a few hints on treatment. Some of the kinds will be selected with some reference to their hardiness.

The following are larger-flowered Chinese varieties: *Empress of India*, pure white; *Gloria Mundi*, bright yellow; *Madame Roux*, very large peony-formed flowers, amaranth red, reverse of petals pale violet; *Temple of Solonon*, deep, golden yellow; *Dr. Sharp*, fine crimson; *Rifleman*, ruby red, incurved;

Lady Hardinge, pale rose; *Golden Empress of India*, bright yellow; *Venus*, pink; *Faust*, crimson purple; *Countess of Dudley*, deep lilac, incurved; *Emily Dale*, primrose.

Pomponne or small-flowered: *Bob*, deep crimson; *Gen. Canrobert*, deep yellow; *Cedo*

Red Dragon, red; *Erecta superba*, bright rose; *Lady Selbourne*, pure white; *Abd-el-Kader*, crimson maroon; *Parasol*, buff shaded with salmon; *Gold Thread*, gold and bronze; *Père Delaux*, reddish brown. The list could be greatly extended; but the kinds named are all good and can be easily obtained, with the exception of a few, such as *Bob* and *Cedo Nulli*, which are not easy to get true to name.

The *Chrysanthemum* is now largely grown as a pot plant for winter decoration; but under glass it is only seen at its best in a low temperature, and chiefly in glass houses built for the purpose, where they bloom freely till the holidays are past. They may, in fact, be had in bloom all winter, if not all summer. The plants, however, are grown in the open air till frost appears, when they are removed to the house. They are grown as bushes and as standards, and need a good deal of attention to fit them for exhibition purposes. How this is done I may tell at some other time. The plants are also frequently grown in the ground during summer, lifted and potted on the approach of cold weather, and taken into the house to bloom.

In a sitting-room or warm greenhouse the plants soon become covered with the black aphid, which renders the plants unsightly and destroys the bloom. The aphid may be killed with *Buhach* powder or by syringing with a solution of carbolic soap, the latter, however, being apt to disfigure the flowers.

The *Chrysanthemum* is propagated by cuttings and by division of the roots, which is done in the spring. If large plants are wanted, the soil should be rich. Plants bloomed under glass should be removed to a cold-frame or a cool cellar as soon as they have done flowering. P. B. MEAD.

CANNA EHEMANNI.

This new or re-introduced *Canna* is one of the best plants we have for the decoration of the lawn. It is truly a noble variety of this favorite class. A correspondent from Wisconsin writes: I dug a hole as large as a bushel basket, and filled it with the richest compost I could find. In this I planted the tubers. As soon as they began to grow, I gave them a great deal of water. The result is, plants six feet high, with enormous leaves of a rich, shining green. A group of them produces a grand, tropical effect.

OUR FLOWER BASKET.

Light frost does not hurt *Canna* roots, but hard freezing injures their keeping quality seriously. Keep in a dry, moderately warm place.

Petalums, *Mignonette*, *Pansies*, and many other self-sown young plants may still be taken up and potted, and will make charming window plants.

Asclepias tuberosa, our wild Butterfly Weed, is one of the most showy perennial plants cultivated in European gardens, and justly deserves a place in our own.

CURLED JAPANESE CHRYSANTHEMUM.

Nulli, white; *Sanguineum*, dark crimson; *Model of Perfection*, lilac, edged white; *Fanny*, rosy crimson; *Princess Meletia*, white, fringed; *Drin Drin*, yellow; *Cendril-*

of carbolic soap, the latter, however, being apt to disfigure the flowers.

INCURVED CHINESE CHRYSANTHEMUM.

lon, rosy lilac; *Brilliant*, orange red; *Jason*, amaranth; *Madame Donage*, golden yellow.

Japanese: *Elaine*, pure white, and very beautiful; *Golden Dragon*, yellow; *Juvenit*, deep crimson; *Fair Maid of Guernsey*, pure white; *Fimbriatum*, delicate pink, fringed;

The Window Garden AND GREENHOUSE.

SPECIMEN PLANTS.

In growing plants for exhibition, or for the decoration of our rooms and halls, it is of first importance to select such kinds and varieties as are best suited for the purpose. The process of producing symmetrical, well-developed specimens is simple enough, if a little care and attention is given.

There is a good deal of misconception about the necessity of special soils for each class of plants. Good, rather sandy soil taken from the roadside or a pasture, and well mixed with one-fourth of decomposed manure is suitable for nearly all cultivated plants. Whether grown in the window, sitting-room or greenhouse, specimen plants should be turned every few days, that every part of them may be equally exposed to light. Stakes should be given when necessary, and strong shoots pinched back so as to maintain a pleasing and symmetrical shape. The one great rule for watering is, never to give water to a plant until it shows signs of being dry, and then to water freely so that the water may reach the soil in the very bottom of the pot.

COLEUS.

Some of the new kinds of fancy Coleus, though worthless when grown in the open air exposed to the full blaze of the sun and drying winds, are perfectly gorgeous in coloring when grown as window plants where sufficient light can be had to develop the coloring of their leaves. Among the most marked and finest new varieties are: Mary Kemersly, carmine and crimson; Magpie, white and green; Golden Dawn, rich canary yellow; Crimson Bedder, vermilion blended with maroon; Paroquette, vermilion, crimson and gold; Aline, rosy scarlet ground, maroon edge; Corsair, scarlet, black and vermilion; Rosser, crimson, green, yellow and maroon; Splendour, carmine ground, fringed gold; Black Butterfly, dark crimson tinted light scarlet; Chameleon, rose, green, yellow and purple; and finally we have the Unequaled, which is rosy scarlet, fringed with yellow.

GERANIUMS.

Another easily managed class of plants is the double and single varieties of Zonal Geraniums. Six of the finest single and double are embraced in those below named.

Single: King Olga, large rose, white center; Snowflake, pure white; Blaziana, dark crimson; Gurnea, orange scarlet; Hebe, deep pink; Mons. Bellot, dazzling scarlet.

Double: Double Gen. Grant, large scarlet; Alba plena, pure white; Jennie Dolphus, violet; Annie Monde, light rose; Grand Chancellor, dark crimson; and the J. C. Rowland, salmon.

Many of the new double sorts of Ivy or climbing Geraniums introduced within the last two or three years are quite equal in size of truss, fullness of flower and brightness of coloring to the best of the zonal class. No

plant is better fitted for room decoration. It can easily be trained on a trellis to the height of six to eight feet in breadth and height, and may be grown in any ordinary light sitting-room nearly as well as in the greenhouse.

The best double Ivy-leaved Geraniums are: Countess D. Chorsel, salmon rose; Madam Thebant, deep rosy carmine; Elfrida, blue; Madame Chervil, rosy scarlet; Emily Lemoine, light scarlet; and the Eva, which is pure white.

CALADIUMS.

Fancy Caladiums are comparatively little known among amateurs, yet for decorative "foliage" plants they stand almost unrivalled, assuming every style of marking, so strange and varied is the splashing and spotting and marbling on the green leaves, that when first seen it seems more like the work of man

ics they can be grown successfully only during the summer months. Specimen plants of Coleus, Caladiums and Begonias should not be started before the middle of May. When started at that time, and afterwards shifted into larger pots, whenever the pots they are growing in become filled with roots, by the middle of September, Coleus will have reached a height and width of from three to four feet, Caladiums of from two to three feet, and Rex Begonias of from one to two feet, if in the meantime ordinary care has been taken for them. PETER HENDERSON.

WINDOW FOLIAGE PLANTS.

BY JOHN THORPE.

In rooms in which the temperature does not fall below 65°, many of the most beautiful foliage plants may be grown successfully; and when it is considered that the plants require not nearly as much care and attention as the more delicate flowering plants, it is surprising that amateurs do not give more attention to their culture in the house.

CALADIUMS.

The species with many-colored, spotted, striped, and mottled leaves, are very handsome plants for summer, and can be started in small pots in March in the warmest corner, repotted as they grow into pots of four or five inches diameter, and by the time other plants have to be removed out of doors these will be fine objects all through the summer months.

COLEUS AND ACHYRANTHES.

These are splendid plants for very warm rooms. Strong tops can be easily rooted from plants growing outside, by the middle of August, taken inside before any chilly nights come, repotted into necessary-sized pots, and kept well supplied with water. They are among the best plants for winter cultivation indoors, and are not at all costly.

CROTONS.

Although Crotons have not as yet been employed for window plants to the extent they deserve, their richly-marked leaves, elegant forms, and variable shapes are always attractive. They delight in rich soil, a high temperature, and moderate light; should be frequently cleansed, either by sprinkling, bathing, or sponging; they may either be kept inside all summer, or after the 1st of June they may be plunged in some shady, warm corner outside, until September. Any straggling shoots should be pinched or cut off from time to time, thus producing a bushy growth. These are among the most showy ornamental leaved plants that can be grown indoors.

DRACAENAS.

These well-known elegant plants are easily managed. *D. terminalis*, *Guitfoylei*, *Cooperi*, and *amabilis* are grown in great numbers for window plants, and if they are treated as advised for Crotons will give the same satisfactory results.

FERNS.

Numerous species succeed in the shadiest windows, requiring but little attention, and are always graceful and cheering. They must be kept well supplied with water; occa-

CROTON AOREOM MACULATUM.

than of nature. The leaves are mostly heart or arrow-shaped, of varying shades of green, and in some kinds the markings look as if sprinkled with white, scarlet, crimson or pink paint drops; others again are marbled and shaded in every conceivable way.

Perhaps the most distinct six kinds are: Refulgens, Edward Moreau, Borral, Ketele, Bicolor, and Dr. Lindley.

BEGONIAS.

The "Rex" or fancy-leaved Begonias are another class of tropical plants of exceeding beauty, when well grown. The leaves are mostly heart-shaped, eight to ten inches in length and width, curiously marked in different shades of green, black, rose and violet. The surface of the leaves of most of them has a rich, metallic luster, looking in some varieties like beautiful frosted silver. As all these plants are natives of the trop-

sionally bathed or syringed; in the summer time plunged out of doors in some shady, damp spot, and in September, before bringing in again, should be repotted. This is about all the cultivation required. A few beautiful kinds are *Adiantum cuneatum*, *Farleyense*, *gracillimum* and *trapeziforme*, *Davallia tenuifolia*, *Lomaria gibba*, *Microlepia hirta cristata*, *Nephrolepis davallioides furcans* and *Pteris Cretica albo lineata*, not forgetting a few varieties of Selaginellas or Lycopodiums.

THE INDIA-RUBBER TREE.

The *Ficus elastica* or India-rubber tree is well known, and might almost be called the indestructible plant. With its bold and leathery leaves and free and noble carriage it bids defiance to dust and smoke alike, providing always it has plenty to drink, with occasionally stimulants added to the soil in the pot.

PALMS.

Palms are the aristocracy among foliage plants, mostly very easy to manage, requiring a good deal of water and not necessarily very large pots; thriving well in a partially shaded window, to be frequently washed overhead, and can always be placed outside under partial shade in summer time. A few fine kinds are *Areca lutescens*, *Caryota urens*, *Cocos Weddelliana*, *Latania borbonica* and *Oreodoxa regia*. They may be used for various purposes of table decoration, and need not necessarily be taken out of doors if desirable for windows in the summer.—From an address before the N. Y. Hort. Soc.

CROTONS.

In the beautiful colors and varied markings of their leaves, as well as in the number of different shapes found in their numerous varieties, the Crotons are not excelled by any other class of plants. Most species are natives of the East Indies and South Sea Islands, therefore requiring for their perfect development a high, moist temperature, but if too succulent a growth has not been made, they make beautiful lawn objects during the hot summer months. I have also seen them planted out in connection with fancy-leaved Caladiums, forming attractive beds.

For exhibition plants, the adornment of the conservatory, and general decorative purposes, Crotons are best adapted and most suited. No collection of ornamental plants can be considered complete without a few specimens, especially of the more easily grown and hardy kinds.

The soil most suitable for Crotons is a compost of equal parts of fibrous loam and peat, with a good addition of sharp sand. Plenty of drainage must be given, as they require when growing an abundance of water at the roots.

When making their growth they require a strong, moist heat, and, in order to get well-colored leaves, they should be kept close to the glass where they can get plenty of light.

These conditions complied with they are easily grown, their beautiful leaves brightening up the appearance of any collection of plants.

Every year we have introduced by European florists new varieties exhibiting all shades of color and all shapes of leaves, some of which are more peculiar than pretty.

I shall, however, only mention such kinds

CROTON CHALLENGER.

as have been tried and are distinct in color and character and well worth growing.

C. variegatum, one of the oldest but one of the best kinds grown, ground color of the leaves, green, broadly margined and striped with rich golden yellow, fine but compact grower and one of the hardiest.

C. pictum, another old variety, the ground

C. Challenger. The leaves of this plant are large, broad, and beautifully striped and spotted with bright, golden yellow. A fine variety.

C. interruptum makes one of the handsomest of plants, grows naturally pyramidal, the leaves long and narrow, some of them twisted, others narrow in one place, wide in another. The under side of the leaf is a dark red, the upper surface reddish green tinged with yellow. Makes a large specimen in a short time.

C. maximum. A large, broad-leaved kind, color bright golden yellow, on an olive green ground.

C. undulatum. The first specimen I saw of this variety impressed me as being the most beautiful plant I had ever seen. The leaves are undulated at the edges, the ground color is a deep green blotched with yellow and crimson, habit good, and an excellent show plant.

C. Veitchii. Another of the large-leaved sorts, the ground color of which is a rich green, having a broad

band of yellow and red running through the center of the leaf.

C. angustissimum has long, narrow, pendulous leaves which are often twisted in form; the color is a bright, golden yellow, giving it a most handsome appearance.

C. volutum is very distinct; its leaves are curled, and elegantly mottled with yellow on green ground. M. MILTON.

RED SPIDER.

(*Acarus telarius*.)

I have repeatedly called attention in THE AMERICAN GARDEN to this persistent foe to window plants, and urged your readers to deny the pest a footing, writes Wm. Falconer. In your report of the meeting of The American Florists at Cincinnati, page 218, Mr. C. L. Allen says that the red spider "never ate a plant in its life. Microscopic insects come to live upon the plants and the red spider to live upon them. It is a friend, not a foe." Now friend Allen will have his little joke, but whether this was a joke or no I cannot say. But I do know and will assert that the red spider (*Acarus telarius*) lives upon the juices of plants, and is one of the worst, if not the most terrible insect enemy greenhouse gardeners have to contend with. Look for yourselves.

OUR WINDOW BOX.

Ferns should never be allowed to become dry; they do better in partially shaded than in full sunny windows.

Rarely has there been a summer when so many flowers have been sold in the Metropolis; retail dealers have not been idle, which is generally the rule at this season; and wholesale florists have been kept fairly busy supplying the watering-places. The late summer has made flowers unusually cheap.

CROTON VOLUTUM.

color of the leaf of which is a fine crimson, spotted with yellow and green.

C. aureum maculatum is one of the most distinct of the *pictum* type; its leaves are bright green, spotted with golden yellow.

C. spirale. As the name indicates the leaves are spiral in form, much resembling a corkscrew. The ground color is green, spotted and marked with bright yellow.

Forestry.

TREES OF THE UNITED STATES.

There has recently been placed on exhibition, at the New York Museum of Natural History, an almost complete representation of the trees of the United States, between 400 and 500 trunk sections of the different species. These specimens are about five feet eight inches long each, cut in such a manner as to display their bark and the transverse and longitudinal sections of the wood. This is done by cutting away one side of each specimen at the top to the depth of one-half the diameter of the trunk and for one-third of its length. One-half of each exposed portion is polished to illustrate the effect of this treatment of the wood, the remainder being left in the natural condition, with the top of the upper divided part finished by beveling. In the case of trees of commercial importance this form of representation is supplemented by carefully selected planks, or by burls, showing better than the logs the true industrial value of the wood. Among specimens of this kind is a plank of Redwood, *Sequoia sempervirens*, measuring eight-and-a-half feet in width. A species remarkable for slow growth, and which is only 24 inches in diameter, shows an age of 410 years, being the oldest tree in the collection. This is the *Picea Engelmanni*, named for its discoverer, Dr. Engelmann, and known also as Engelmann's Spruce. Another example of slow growth is seen in the *Pinus edulis*, or Edible Pine, from Arizona, called also Nut Pine. The seed of this Pine, which resembles a good-sized Bean, is used by the Indians for food. A tree of this species which is 369 years old, measures only 15 inches in diameter. Another specimen, which is 341 years old, shows a diameter of 37 inches. It is the Western Shell Bark Hickory, *Carya sulcata*, from Allentown, Mo. The same locality is represented by a specimen of the *Tilia Americana*, or Basswood, which is 40 inches in diameter, and 150 years old.

This valuable collection, numerically exceeding that made in connection with the census reports, includes examples of many curious and interesting species, of which probably the complete natural series could never have been viewed in their native soil by any single traveler, however diligent. Among specimens of such interest is that of the *Gleditsia triacanthus*, or Honey Locust from Missonri. This is a tree of singular appearance. Its trunk is covered with thorn clusters, the spikes shooting ray-like in all directions from their growth centers. These thorn formations have their basis in the bark alone, without any source whatever in the wood itself, not even reaching it, and are easily detached. It was, therefore, necessary to suspend the tree from the ceiling of the car in its journey from the West.

Another extraordinary tree is a representative of Texas. This is the *Cereus giganteus*, a Cactus which resembles a fluted column. It is a tree which can be readily taken all to pieces. Its component parts are in the form of vertical sections of twisting curvatures in the line of their circumference, whereby one portion is fitted exactly to another. They can be separated without the slightest diffi-

culty, in the absence of any heart at the center for their attachment. The Washington Palm from Southern California is also curious. The specimen includes the top of the tree, which is severed from the body, and bears its dried and yellow widely-spreading leaves. Its peculiarity is in the ring formations of the trunk, which are almost wholly detached from each other, standing one within another like a succession of forams of bark, which are easily separated.

The Coconut tree from Key West and the finely odorous Nutmeg tree from California are among other specimens of importance. The Catalpa is represented as a species most remarkable for its durability. Some of this wood known to have been buried in the earth for seventy-five years has been brought out in perfectly sound condition. Specimens of beautiful woods are seen in the Holape-sis, the Arbutus, Sweet Bay, *Persea carolinensis*, Alaska Cedar, *Chamaecyparis nutkan-sas*, and the beautifully figured Maple Burl from Missouri.

With only seven unimportant exceptions, the specific gravity, ash, and fuel value of the wood of every indigenous arborescent species of the United States have been scientifically determined. The specific gravity is obtained by weighing carefully measured specimens 100 millimeters long and about 35 millimeters square, previously subjected to a temperature of 100° until their weight became constant. The ash is given in percentages of dry wood, which are determined by burning small blocks of the wood in a muffle furnace at a low temperature. The relative approximate full value of any wood is obtained by deducting its percentage of ash from its specific gravity. The correctness of the result thus found is based upon the hypothesis, first proposed by Count Rumford, that the value of equal weights of all wood for fuel is the same, which is considered to be approximately true.—*Scientific American*.

Sewage.

HOW THE SEWAGE OF PARIS IS DISPOSED OF.

When the publisher of the GARDEN was travelling in Europe, a few years ago, studying various phases of agriculture, none was more interesting than the utilization of the sewage. In France the idea has its greatest development. *La Semaine des Constructeurs* quotes from a pamphlet just published by M. Durand-Claye some definite statistics in regard to the Gennevilliers irrigation and the sewerage of Paris, which are well worth remembering. For some reason, the results of the Gennevilliers experiments have been for a long time obscured by a curious indefiniteness, not to say wildness, of statement on the part of those who had pretended to have examined them, which no impartial person seemed to think it his business to correct; so that the city of Paris has now definitely committed itself to irrigation as a mode of sewage disposal, and it has become necessary to obtain exact statistics of what has been accomplished, for the benefit of the city engineers, and incidentally for that of the rest of the world.

To begin at the beginning, the entire efflux through the sewers of Paris is ascertained to amount, on an average, to 362,000

cubic meters a day, or about 96,000,000 gallons. This is almost exactly three-quarters of the total amount of water furnished by the aqueducts and the rainfall, the other quarter being carried off by evaporation, absorption into the soil, or by flow over the surface directly into the Seine. All the drainage flow, before leaving the city, is collected into three great intercepting sewers, two of which, conveying 318,000 cubic meters a day, join into one at Clichy, just above a pumping station, where engines of 1,100 horse power lift a part of the liquid into the pipes, which convey it to Gennevilliers, while the surplus is allowed to flow into the Seine. The remaining intercepting sewer carries 44,000 meters a day by gravitation to the Seine at Saint Denis, but a branch is taken from this early in its course which conducts a portion of its flow to Gennevilliers, to supplement the main system.

The main irrigation conduit, which leaves the great double intercepting sewer at Clichy, is of rubble and Portland cement, 40 inches in diameter. After reaching the irrigated field, it gradually diminishes in size, throwing off branches, formed of concrete, and varying from 14 to 40 inches in diameter, which serves as an overflow, to carry the surplus liquid of storms into the river. The supplementary irrigation main branches in the same manner over a different portion of the territory, and the filtered effluent is conducted to the Seine by collecting drains. The present area of irrigated land in the Gennevilliers peninsula is 1,430 acres, and the system is continually being extended to new land at the request of the owners. The whole amount of sewage brought to the peninsula by the drains is 18,000,000 of cubic meters a year, or about 12,000 meters annually to the acre—not far from 3,000,000 of gallons per acre—an amount sufficient, if delivered at once, to cover it all about nine feet deep.

Experiments have been made to determine whether a larger flow could be advantageously used, and for growing Beets it seems likely that much more could be absorbed; but for general purposes the present flow is well proportioned to the needs of the ground, and the annual return from the crops is from \$250 to \$800 per acre, and even more where a cultivator has made a fortunate choice of a special product. The rent paid for the land has tripled within a few years, and averages now \$38 an acre; while the population of the place increases constantly by the arrival of farmers anxious to share in the profits of sewage cultivation.

Judging from the results obtained here, the engineers of the city have decided that 10,000 acres of ground will satisfactorily and profitably purify the whole of the sewage of Paris, and have set about inquiring for suitable territory to that amount. The districts of Acheres and Saint Germain, which have already been condemned and taken for the purpose, will furnish only 3,000 acres, in addition to the 2,000 contained in the Gennevilliers, so that 5,000 more must, sooner or later, be found somewhere; but there can be no doubt that, with anything like the high rents paid at Gennevilliers, the returns from the land taken for irrigation would make the expense of taking it a safe and profitable investment for the Parisians.

Lawn and Landscape.

TRUE LANDSCAPE ART.

Donald G. Mitchell, in his work entitled "Out of Town Places," says the true art of landscape gardening lies in such disposition of roadways, plantations, walks and buildings as shall most effectively develop all the natural beauties of the land under treatment, without conflicting with the uses to which such lands may be devoted.

It comes also within the domain of the landscape art to secure an agreeable lookout from the cherished windows of the country homestead, whatever may be its situation. Accident or choice of site may indeed secure this beyond question, but site being established where views are limited or obnoxious objects fret the eye, it is surprising what may be done by judicious planting.

THE YEW AS A LAWN TREE.

A group of Yews, says Josiah Hoopes in the N. Y. Tribune, constitutes one of the prettiest features on a lawn, and though there is an impression that they are not hardy, the contrary will prove the rule, in all sheltered locations in the Middle States. During exceptionally severe winters the young shoots are liable to injury, but although this may disfigure the plant for a time, it will eventually cause a denser growth and more desirable form. An annual pruning is requisite with the entire family, yet merely the tips should be cut, as the growth is slow.

An enumeration of the various kinds is unnecessary here, as our leading nurserymen mostly keep a good assortment in stock, but the following should be included: *Taxus cuspidata*, a very hardy species from Japan. *T. aurea*, the bright Golden Yew so popular in England, and succeeding here in sunny exposures. Our native species, *T. Canadensis*, trailing in a wild state, but forming an erect, bushy plant when pruned regularly. *T. Canadensis variegata*, or *T. Washingtoniana*, a pretty, variegated form of our native plant. There are numerous others, valued mostly on account of difference in outline, growth or color, which show to decided advantage when contrasted in a group.

PRAISE OF SHRUBS.

Ornamental shrubs, judiciously planted and grouped on a lawn or about the dwelling, impart a grace and beauty that nothing else can furnish. Shrubs, said W. C. Strong before the Massachusetts Horticultural Society, are peculiarly adapted to give the best effects at the least cost and with permanent results. There is no danger that they will grow up to shut out the sunlight and views from our dwellings. Many of the coarse-growing kinds are not in keeping with highly cultivated estates, but may be used in less conspicuous positions and for wind-breakers. But there is left a long list of kinds suited to the most cultivated positions; the difficulty will be in making judicious selections.

However much we may prize the flowering quality of shrubs, we must remember that this is shown in most cases for only a week or ten days in the year, and we desire something more than this brief enjoyment. It is true we have some shrubs which flower at periods of scarcity, like the Cletlura and

Hydrangeas in August, and the Altheas in September, and which would therefore be indispensable for that quality alone. The Rose also is an example of such superlative beauty in bloom that it can well afford to stake its reputation upon this one point. Still, it remains true, as a rule, that we must seek for effect in form, and for grace and luxuriance in foliage, as giving more enjoyment in the aggregate than flowers in their brief period. We must study to harmonize and heighten the effect of color, form and size in our lawn planting.

We have a greatly increased range of color, from the white of the Cornus and Altheas, the golden of the Elder and Spiraea, and of evergreens the Retinispora, Arbor Vitae and Yew, the vivid green of the Forsythia, to the dark shades of Berberry and Hazel. What combinations of light and shade may be made with these materials! Again, we have great variety in size and character of growth, from the most delicate evergreens to the rugose vigor of the Japan Rose. What striking effects may be produced when these are used in harmony with each other and with their surroundings! Judicious planting is a great art, but it is an art which insures a great and permanent reward.

LAWNS AND LAWN GRASSES.

Recognizing the paramount importance of a good lawn as an indispensable part of every rural home, we have frequently given directions for the preparation and establishment of lawns, so that but little that is new can be said on the subject. Yet the following suggestions made by Daniel Batchelder at a recent meeting of the Western New York Horticultural Society are so practical and to the point that they may serve as answer to several questions before us:

Comparatively speaking there is very little land in our country that does not require underdraining and thorough amelioration to bring it into a fit condition for good lawns on which the finer grasses will grow and keep verdurous during our almost tropical summers. Of course there are deep, sandy loams, resting on gravel bottoms, where the natural drainage is all sufficient; there are also in some situations, top and sub-soils so light and sandy—leachy—that they do not need a change of texture to the depth of 18 inches before a permanent sod can be maintained.

If a soil is a heavy clay loam it should be brought into the very best condition that draining, deep plowing, trenching, manuring and pulverizing can do; as in our climate we do not obtain the requisite amount of moisture from the air, we must seek it in the ground where, by deep culture, it can be obtained. A still, clay soil is not much better than a dry, sandy one for resisting drought, as the former becomes hard and baked on the surface in dry weather.

One advantage to be derived from deep working and manuring is that the ornamental trees will do so much better on a soil thus well prepared than they would on a poor, stiff sub-soil; but the greatest benefits would be that the grasses will not burn out in dry weather. A course of trenching, either with a spade or a trenching plow, done in autumn, would be the best if the lawn is to be finished the following spring. Ground thus

prepared in autumn will settle well during the winter, and would not require as much rolling to bring it down to a proper condition for seeding or for sodding.

If, however, the soil is to be prepared, and the whole work done before winter, then the land should be thoroughly rolled both before and after seeding or sodding, so as to prevent irregular settling when the whole is completed. After the plowing, manuring, and thorough incorporation has been done, then a top-dressing of lime may be put on, at the rate of about three tons to the acre, and harrowed or forked in. The seed-bed may then be made as smooth as possible by fine raking—seeding and raking being both done at the same time. A good liming at the outset will prevent the excessive increase of grubs and worms; besides, it has been observed by good farmers that the finer grasses thrive much better in pastures after the land has been limed.

In making a lawn on light, sandy soil, where there is but little humus, lime would not be of much use as an ameliorator; for such a soil has but little vegetable or carbonaceous matter on which the lime can act. The lime would soon sink in the soil, and even while it remained at the surface, it would only retard vegetation. The preparation of a sandy soil for a lawn should therefore be different from that of a heavy loam, as the plowing, trenching, and incorporation of manure, together with all other work, would be much easier done; but the manuring should be very heavy, and supplemented with some good loam and black muck, treated with a sprinkling of quick lime. Muck is not only retentive of moisture, but is, when slightly limed, a most valuable fertilizer for light, sandy land, as it brings carbonaceous matter to the soil and gives to it the important capacity of retaining nitrogen.

As to the grasses best adapted to soils and situations, it may first be said that a wet soil is hardly to be considered as a fit situation for a lawn; nevertheless there are places where a wet condition of the soil cannot well be avoided, and for such the best grasses are *Poa trivialis* or Rough-stalk Meadow Grass, *Alopecurus pratensis* or Meadow Fox-tail, and *Agrostis vulgaris* or Red-top. For average good soil I have had the best results from a seeding, in about equal proportions, of *Poa pratensis* or Kentucky Blue Grass, *Festuca duriuscula* or Hard Fescue, *Agrostis canina* or Creeping Bent, *Cynosuroides cristatus* or Crested Dogtail, and the Pacey Dwarf Rye Grass. The two last named are especially adapted to light, dry soils, as they are deep rooted and very fibrous, and will continue green in the driest of weather, even when the Kentucky Blue is apparently dead.

It is a great mistake to stint the seed when making a lawn. Three or four bushels to the acre should be laid on and fairly covered before rolling down. The small granivorous birds, especially the sparrows, will be sure to eat all the seed left on the surface.

If the soil on which a lawn has been established be light and leachy, then it will be necessary to lay on every autumn plenty of rotten stable manure, not only for fertilizing but as a retainer of moisture. If the soil is a clay loam and the lawn has been properly prepared, but little top-dressing will be required, especially of heavy material.

Rural Life.

HOW TO ADORN A COUNTRY HOME.

"Picture to yourself a young married couple just starting on a small farm of their own, having very small means but lots of hope and good sense, with very little actual knowledge of horticulture and landscape gardening. Tell them how by inexpensive methods they may rapidly adorn and make beautiful their premises," wrote Chas. W. Garfield to Ossian C. Simonds, and the following is the latter's reply as given in "A Primer of Horticulture."

It must be encouraging to such to know that every year many wealthy men of our large cities, men who wish to spend their remaining days in enjoying the money earned during previous busy years, go into the country to live, believing they can secure the greatest happiness there. These men find pleasure in their beautiful trees, lawns and flowers, and in various features of nature with which they are surrounded. This pleasure is very pure and refining, and detracts in no way from the pleasure of others. A farmer can watch a sapling, which he can carry in one hand, develop into a noble tree, and can take delight in the natural objects around him during his whole life if he chooses to do so.

It is right for a man to enjoy life to the fullest extent. There is no habit that will give one keener pleasure than that of observing the beauties of nature. It is an inexpensive habit, too, and should last during life. The young farmer has an excellent opportunity to study our native trees and shrubs. He should do this in company with his wife, and should also cultivate his taste by reading what has been written by talented men concerning decorative planting. I remember going through a farming country where fully half the farmers had cut down magnificent old Oaks and Elms, and had planted in their places almost worthless varieties of Willows and Poplars. Here good taste was not shown, although the disposition to enjoy trees was not entirely wanting. Almost every farmer might have made his home the realization of a picture as interesting as that suggested by Milton's lines:

"Hard by a cottage chimney smokes
From between two aged Oaks."

It takes a lifetime for a tree to grow to a size that gives it dignity, and every effort should be made to save old patriarchs.

We should try to make our homes seem cheerful. The windows have much to do in producing this effect, and the more beautiful the views can be made, the more cheerful will the rooms be. Let us suppose a case.

Look out of the window of your living-room and note the various objects. No trees or shrubs have yet been planted; we see a naked yard separated from the street by a fence. Diagonally across the street is a neighbor's house, with his barn and the usual accompaniments just back of it. Turning your eyes toward the right you see another neighbor's house with his barn also in plain sight; still further toward the right there is a dreary expanse of fields surrounded by fences, the view being terminated in the distance by the woods. Finally, at the extreme right the view is cut off sharply by your

own out-buildings in all their native ugliness. The first thing to do here in the planting line is to so place trees and shrubs that the objectionable features will be hidden. Frame the first neighbor's house by planting trees so as to hide the space on each side, thus shutting the barn out of sight, and putting in its place, as far as the view from your window is concerned, a pleasing variety of foliage. Perhaps have only the front porch of the second neighbor's house in sight, with a glimpse of his lawn and ornamental trees.

Next have a view across the fields with the woods in the distance, but break up the monotony by planting groups of trees in the corners of lots or along fences. These may deprive you of the use of a little land, but the comforting shade which they give to your stock and the rest they give to your eyes will fully compensate for this. Hide your own barn next, to still further improve the picture.

Fences are nearly always disagreeable to look at and should only be used where necessary. They suggest a limited space and a sort of confinement. If you are so fortunate as to live in a neighborhood where animals are not allowed to run in the street, you can do away with your front fence altogether. If it is necessary that the fence should remain, plant groups of shrubbery in front of it.

If you do not wish to spend any money you can produce very pleasing effects with trees and shrubs from the woods. Get them from the outskirts and open places, as such will stand transplanting better than those that are shaded. Get such as have made a vigorous growth and are perfectly healthy. Spare no pains in securing a large quantity of roots. Cut the ends of these smoothly before planting, and shorten the branches. Plant in the fall after the leaves have fallen, or in early spring.

In planting a group try to hide all the stems or trunks with foliage by preserving the lower branches, planting the tallest trees in the center, medium size next, and shrubbery graded according to size on the outside. Nature always plants in this way. Plant trees which have beautiful autumn leaves, so that they will be fully exposed to the sun and to your window, but do not plant trees so that they will keep sunshine from your house.

The ground between that which you plant and your house should be covered with a good turf. This can be secured by making the ground mellow, rich, and evenly graded, and sowing Kentucky Blue Grass and Red Top seed in September or in early spring. It may be so shady under the trees that the grass will not grow there, but do not trim them up and spoil them for the sake of the sod. Instead, plant our native Ferns and such flowers as the Liver Leaf, Trillium, Spring Beauty, Blood Root, and Twin Leaf, and you can have a beautiful wild garden with no expense after the first year. Wild Sunflowers and Golden Rod can be planted among the shrubbery and will produce a brilliant effect in autumn.

In conclusion, I will say that there is no calling which can furnish more real enjoyment than that of farming to those "who have lots of hope and sense," and who will avail themselves of every advantage offered. By "farming" is meant all soil culture.

CLEAN CELLARS NECESSARY FOR HEALTHY HOMES.

In city and country alike, it is the dark corners, the neglected and little used places in a house, which most frequently contribute to its unhealthfulness, and in ways which are the more insidious because so often unsuspected. In this respect the cellars of many houses have much to answer for, for they are generally dark and damp, with no direct rays of the sun to kill the mephitic gases which always seek those low levels, and no ventilation to disperse them, even where the cellars themselves are not made the depositories of cast-off rubbish and vegetable refuse.

Therefore the warning cannot be too often given, especially in the spring, when so many families move into new houses, and when the good housewife generally enforces the most thorough cleaning and overhauling of the year, to look to it that the cellar is not neglected. Their ceilings and walls should be plastered and whitewashed or calcimined where possible, to keep them dry and clean, and the occupants should prevent their cellars above all things else from becoming "poke holes" for rubbish; the floors should be well paved or cemented, to keep out emanations from the soil; and where this can be done, they should be ventilated by keeping open in dry weather, windows or doors communicating with the outside air.

Emanations from cellars do not kill in a night; they are but too frequently not noticed at all, although damp and mouldy cellars have undoubtedly done much to undermine the health of many families. The cellar air is taken up through the rooms of a house gradually, and in small doses at a time, but the warmer air of the upper rooms produces an upward current every time the cellar door is opened, and neglect in regard to this matter is sure to entail serious consequences because the real reason is so often overlooked.—*Scientific American*.

RURAL FELICITY.

The Chestnuts they are snapping
On the rosy-tinted fender;
The maid is in the cellar.

Where her papa he did send her
To draw a mug of cider,
To bring some Golden Pippins,
Some doughnuts and some ginger snaps
To fill the eve as chip-ins.

The hired man is greusing
His kipsklus with the tallow,
The while he sneers some taffy
O'er the butter-maker callow;
The little boy is phneling
Poor passy's tall in antle;
The grand dame she is trying
To threat her needle fraule.

The horses they are ridding
Their noses 'gainst the manger.
The cock is softly emtonging
His wives against the stranger;
The shudons on the hillside
Are turning into black;
The young folks they are hurrybug
From emdy froffe buck.

The watchdog he is barking
At the moon above the Maple;
The tramp is softly drawing
The lock out of the staple;
The water wheel is silent,
The pigs he close together;
A most convenient modus
Operandi in cold weather.

Exhibitions & Societies.

AMERICAN POMOLOGICAL SOCIETY.

Ritorial Correspondence of The American Garden.
(CONTINUED FROM OCTOBER ISSUE.)

The discussions of new fruits, Apples and Grapes especially, occupied a large part of the session, and will be printed in full in the Society's Transactions. Several excellent papers, of value to every fruit grower, were read, some of which we shall give in full in future numbers of THE AMERICAN GARDEN. Among the most noteworthy were: Injurious Fungi, by Prof. Chas. E. Bessey, and Prof. J. C. Arthur; Economic Entomology, by Prof. A. J. Cook; Best Method of Prevention or Protection from Frost, by Prof. W. R. Lazenby; Conducting Horticultural Societies, by L. B. Pierce; Lessons of the World's Fair, by L. A. Goodman; Proper Nomenclature of Fruits, by T. T. Lyon; Nomenclature of our Russian Fruits, by Chas. Gibb; The Influence of Pollen, by A. S. Fuller, Prof. W. R. Lazenby, E. Williams, Dr. F. M. Hexamer; Hardiness of Fruits, by C. A. Green; Blackberries, by G. Cowing; Improvement of American Grapes, by Geo. W. Campbell; Classification of American Grapes, by T. V. Munson; Need of Gathering Statistics, by W. I. Chamberlain; Packing and Shipment of Fruits, by Parker Earl; Fruits of the Northwest, by P. M. Gideon; Insects Injurious to Fruits, and Remedies, by Prof. Lazenby; Hard Problems in Pomology, by Prof. J. I. Budd; The Coccoanut and Where to Grow it, by E. S. Field.

Col. Norman J. Colman, Commissioner of Agriculture, who for many years has been a valuable member of the Society, attended the greater part of the session, and, on the motion of Dr. Hexamer, being invited to address the meeting, said that he believed himself to be the first person placed at the head of our agricultural interests who has been a practical horticulturist, and that during his term of office he would be anxious to do for them what he could to promote the interests of Pomology and Horticulture. He had already put machinery to work in aid of the horticulturist, and he thought there ought to be a pomological or horticultural division connected with the Agricultural Department. There never had been a time when more intelligent work was needed to be done by American farmers than now. With insect foes almost innumerable, with blights and mildews and rusts, with over-production staring us in the face, it is only the intelligent, the progressive, the industrious that will succeed. The laggards will be left behind.

The programme of the closing session consisted of three-minute responses to some twenty toasts proposed by Secretary Garfield. This was a happy conception and most successfully carried out.

A pleasing incident on the last day of the session was a drive through the suburbs of the city, in private carriages furnished by some of its public-spirited citizens. This was a most agreeable occasion, affording the guests an excellent opportunity to view the many elegant suburban residences, beautiful gardens and lawns, and picturesque scenery, leaving bright memory recollections of the delightful days spent in this charming city.

AMERICAN FORESTRY CONGRESS.

The annual convention of this association, held at Boston, was one of the most important meetings ever held in the country. It was proposed to secure the appointment of a committee on forest legislation, and to draft effectual laws for the preservation of forests, both national and State. The active cooperation of all interested in these important measures is earnestly to be desired. E. B. Fernow, 13 Burling Slip, New York, is secretary of the congress.

AMERICAN INSTITUTE OF NEW YORK.

The annual exhibition of the Institute, which in reality represents the Agricultural County Fair of New York, opened on Sept. 30th with a grand Floral Display in the upper hall of the exhibition building on Third Avenue and 63d and 64th Streets. This arrangement, by which all the plants and flowers could be seen together, was a decided improvement over that of former years, by which they were scattered on the ground floor among the various departments. The disposition of the exhibits was tasteful and convenient, so that visitors could conveniently examine every plant and flower.

Probably the most valuable exhibit was John Finn's collection of Palms, Ferns, and various stove and greenhouse plants, in all some 200 specimens, and among them many of great beauty and value. Hallock & Thorpe were the largest exhibitors, being represented in almost every department, and as usual taking the lion's share of the prizes. W. C. Wilson exhibited some 300 plants, comprising a very great variety. His Orchids and Nepenthes formed an important center of attraction.

Floral designs, baskets, bouquets, etc., were represented in all imaginable shapes and combinations. The most remarkable feature about this class was that although the exhibits varied widely in taste and conception, there was not a single ugly design on exhibition. In the arrangement of wild flowers especially the skill and taste displayed by the exhibitors was of a high order.

From October 7th to 14th the Exhibition of Fruits and Vegetables was held in the same room. In point of quantity and number of exhibits we have seen better fruit displays at the Institute, but we doubt that at any previous exhibition there were so many perfect and superb specimens on the tables as on this occasion. Ellwanger & Barry, Rochester, N. Y., exhibited 100 varieties of Pears, nearly every one of which was a model of perfection. "Mikado," a Japanese variety, golden yellow with black spots, was declared by everyone the most handsome Pear on the tables. Among other highly attractive ones were Mad. von Siebold, Boussoe, Howell, Superfine, Angouleme, Flemish Beauty, Pound, Anjou, Columbia, Cauandagua, Bose, Fred. Clapp, Diel, etc.

T. S. Force, Newburg, N. Y., showed fifty varieties of Pears, and the same number of Apples of rare excellence. Among other exhibitors in this class we noticed D. Van Alst, J. A. Wagener, Geo. Mathews.

In the Grape division E. & J. C. Williams, Montclair, N. J., were awarded the first honors; T. S. Force, although he had to content himself with a second prize, made a most excellent exhibit; of special interest

was a collection of native, and one of hybrid seedlings raised by Dr. W. A. W. Culbert, some of which are of high promise. Among the choicest specimens we noticed Lady Washington, Jefferson, Moore's Early, Worden, Silver Dawn, Catawba, Brighton, Delaware, etc.

In the Vegetable Department the same excellence of exhibits was notable. Among the principal exhibitors were Geo. Mathews of Great Neck, L. I., R. Brett, gardener to J. R. Pitcher, Short Hills, N. J., F. B. Kelly, Middlehope, Orange Co., N. Y., and others.

An entirely novel feature is the display of Hardy Coniferous and Evergreen Plants, which commenced on October 16th and continues one month. To our taste this is the most attractive and most interesting exhibition of the series, and the exhibitors—S. B. Parsons & Sons, Flushing, N. Y., especially, whose choice and large exhibits are the admiration of every visitor, deserve handsome recognition. It is to be regretted that the schedules for this special exhibition could not have been sent out earlier in the year, so as to afford nurserymen at a distance an opportunity to prepare specimens for exhibition purposes.

As a means for the convenient study of hardy, choice Coniferous trees this exhibition offers an unequalled opportunity, as every specimen is plainly and correctly labeled, and almost every species and variety of Spruces, Pines, Arbor Vitæ, Cedars, Cypress, Junipers, Taxus, Retinisporas, and evergreens of every kind that are hardy and desirable in this latitude is here represented. No landscape gardener, or lover of beautiful shrubs and trees, should neglect to visit this exhibition.

SOCIETY OF AMERICAN FLORISTS.

THE MEAT OF THE MEETING.

Special Correspondence of The American Garden.

(CONTINUED FROM OCTOBER ISSUE.)

In the discussions which continued on from the matter of last issue, considerable study was given to

STEAM VS. HOT WATER.

Pres. Thorpe said the fact that hot water heating of greenhouses has been in successful operation for twenty years, is sometimes used as an argument against any change to steam, and yet the same arguments were used in favor of the flue system when hot water heating was first agitated some thirty years ago. There are many failures in hot water heating and many crude and preposterous ideas are put forth. "It is useless for me to-day to ask which is the best, hot water or flues. Hot water has had to fight for the position it holds. The progress that steam heating has made in the past six years leads many to think that it is the true method of heating and that hot water must go. There is a good deal of truth in the statements made for it, and many establishments are most successfully heated in this manner. We have to admit some failures as great as were the failures of hot water upon its first introduction. It is an established fact that not more than a certain amount of heat can be extracted from a given quantity of fuel, and that in all cases the best is the cheapest, also that the fewer impediments are put in the way of extraction the more satisfactory are the results. It follows that

the more complete the apparatus used and the more capable of the most economical distribution of the heat engendered, the better; the more complete the circulation without friction or other impediments, in proportion will the success or failure of either steam or hot water be."

Messrs. Taylor of New York, Bachman of Pittsburg, Spaulding of Norwich, Ct., and Hamilton of Allegheny spoke in favor of steam. Mr. Bachman claimed to have been the first to apply steam for this purpose. Mr. Spaulding was very enthusiastic in favor of the new system. He would apply it to private as well as commercial houses and claimed a saving of thirty-three per cent in fuel. Steam is especially economical in March and April, as the pipes can be cooled or heated very rapidly and the temperature more easily controlled. Some one urged the objection that rapid cooling was a disadvantage that might work disastrously in very cold weather if the furnace failed from any cause to generate sufficient steam.

Mr. Hendricks formerly used square flues and tile, but is now using hot water, and he advises those who were well fitted up in the hot water apparatus to continue its use. Greenhouses built upon a different plan from those at present in use would be necessary for steam heating. He had little doubt that steam would be the mode of heating at some time in the future.

John Henderson thinks steam more economical than hot water and advised its use in new houses.

Robt. Craig of Philadelphia who runs thirty houses and uses both steam and hot water, sees little difference in the expense of producing the same amount of heat. Hot water apparatus is far from perfect, and were the same efforts made toward perfection in it that are being put forth in introducing steam there would be no need of changing.

HAIL INSURANCE.

Many Western members had been severe losers by hail storms during the past two years and were anxious to have a Protective Association organized to insure members against loss. A circular upon the subject was sent out in the spring, 1600 reports being solicited; 244 answers were received and 102 reported damage. The least number of feet of glass lost in one year by one man was 10, the greatest 7,500. Many of those present were in favor of forming an underwriting association. The subject was referred to a committee to report at the next annual meeting, which is to be held in Philadelphia on the second Wednesday of August, 1886.

An invitation of the C. H. & D. R. R. to visit the soldiers' home at Dayton on the following day (Friday) was accepted, and the next morning about 360 persons took the train for Dayton. A meeting for the election of officers for the coming year resulted as follows: *President*, John Thorpe, Queens, N. Y.; *1st Vice-President*, Robt. Craig, Phila.; *Treasurer*, M. A. Hunt, Wright's Grove, Ill.; *Secretary*, E. G. Hill, Richmond, Ind. As a token of esteem the members presented a valuable gold watch to Pres. Thorpe and a brooch to his wife. Speeches by Allen, Hendricks and Sanders were pertinent and witty.

The report on effecting better security and facilities for the shipment of cut flowers, read by Mr. Long of Buffalo, N. Y., was

adopted, as well as the proposed Trade Mark consisting of a large Rose Leaf with the imprint F. F. (Fresh Flowers.)

After some final resolutions and mutual congratulations upon the success of the occasion the meeting adjourned, all being well pleased with what has been accomplished, and more hopeful still of the future usefulness of the Society.

MASSACHUSETTS HORTICULTURAL SOCIETY.

Boston "Flower Shows" differ essentially from those of other cities. There is an air of enthusiasm and refinement about them which is not found elsewhere. While in New York especially, nearly all the exhibitors are professional growers who make the best possible use of the "shows" as an advertising medium, the principal exhibitors in Boston are amateurs like Hunnewell, Ames, Payson, Pratt, Wilder, Kidder, and many others who take pride and pleasure in thus contributing the treasures of their gardens and greenhouses for the public good. Not that there are not as choice collections of plants elsewhere, but their owners—with but very few praiseworthy exceptions—are not possessed of sufficient liberality and public spirit to allow their gardeners to bring them to public exhibitions.

The annual exhibition held from the 15th to the 18th of September was a grand success in every respect, and might well have challenged comparison with any previous one. The committee of arrangements, under the able chairmanship of E. L. Beard, have fairly outdone themselves in the artistic and effective arrangement of the plants. The upper hall in which the plants and flowers were displayed, certainly was never before so crowded with such a wealth of beauty in flower and foliage, native and foreign, tropical and from the temperate zones. The fruits and vegetables in the lower rooms were perhaps not so abundant as in some years, but any deficiency in this respect was more than made up for in the overflowing riches of the plants and flowers.

A large, magnificent specimen Palm, a *Cocos Bonnetii* from S. R. Payson, occupied the center of the hall, and spreading like a fountain completed the pyramidal outline, forming the crowning beauty to the whole arrangement. Mr. Payson also contributed a large stand of plants, among which was a remarkably fine specimen of *Croton variegatum* and another of *Alocasia Tibourantiana*. The tank of Water-Lilies from E. D. Startevant of Bordentown, N. J., attracted great attention. It was superior to the similar displays which he has made in former years, and contained a great number of beautiful flowers, well worthy of the admiration they received. The tank also contained specimens of *Nymphaeas* from N. Shupkins of Yarmouthport. H. H. Hunnewell contributed two large groups of plants; in the center of one was a superb specimen of *Cissus discolor*, and the other comprised a plant of *Asparagus plumosus scandens*, in flower, the first time it has blossomed here. F. L. Ames also had two large groups, one of which had a large plant of *Anthurium Vetchii* as the crowning feature; the other included two new *Crotons* of remarkably fine color, *C. Montfortiensis* and *Dayspring*. Mr. Ames also contributed a plant of *Ataccia cristata*, or

devil flower, which certainly had rather a diabolical look. But to balance this there were two Orchids, which are always eagerly inquired after, the *Odontoglossum grande*, or baby flower, from D. Allan, and the *Peristeria elata*, or dove plant, sometimes called *Espiritu Santo* or Holy Ghost flower, from H. P. Kidder. Mr. Kidder had a large stand filled with plants, among which were some fine Fuchsias and the rare *Croton illustris*. G. A. Nickerson sent besides other fine plants an excellent specimen of *Croton Queen Victoria*. David Allan, gardener to R. M. Pratt, had three large stands of Ferns and other plants, including two new foliage plants, the *Croton Chelsonii* and *Alocasia Sanderiana*, besides *Ixora Westii*, a new flowering plant. Among the Orchids we noticed a plant of *Saccolabium Blumei*, with a most beautiful spike of flowers, from E. W. Gilmore. John L. Gardner had a fine specimen plant of *Eurya latifolia variegata*, and C. M. Hovey filled the stage with a great variety of fine plants. But time would fail to speak of the Sphero-gynes, Nepenthes and multitudes of others, and we can only allude to the cut flowers of Dahlias, Asters, Gladioluses, Marigolds, Petunias, Pinks, Cockscombs, Nasturtiums, all of which were represented by the best specimens that nature and art in cooperation can produce, or of the wild flowers which loving hands have brought from their native haunts.

The Grapes, both foreign and native, the Plums and the Crab Apples, filled a table in the library room, which represented an exceedingly rich display of color. Of foreign Grapes, David Allan had a superb collection, comprising a bunch of White Syrian weighing six pounds and an ounce, and one of Alwick Seedling weighing five pounds five and a half ounces. Of native Grapes, John B. Moore & Son had fine specimens of Moore's Early and Francis B. Hayes; H. Barker of Lady Washington, and W. C. Strong of Worden. The Apples and Pears were in the Lower Hall. This being the off-year for Apples a large display was not expected, but the specimens were excellent. The Pears also were so uniformly good that it is difficult to particularize, but the Souvenir du Congrès, from their size and beauty, were perhaps the most remarkable.

A very fine exhibition of vegetables was made. Tomatoes were not quite so abundant as usual, but the Celery, Egg Plants and Greenless Melons were plentiful and of excellent quality. The Cauliflowers were not large, but very perfect. Hon. J. J. H. Gregory had an interesting collection of twenty-four varieties of Corn, all planted at the same date to determine their earliness and productiveness.

A pleasing and interesting feature formed the collections of beautiful and rare evergreen trees from W. C. Strong and J. W. Manning, which filled the halls of the building. But, although we have barely given an outline of this memorable display, we find our allotted space already filled, and must therefore leave the rest to the imagination of the reader.

The list of prizes awarded would fill more than a page of THE AMERICAN GARDEN. Those interested may, we suppose, obtain it from the society's excellent secretary, Mr. Robert Manning, Horticultural Hall, Boston.

Gardening is the most beautiful, the most healthful and most enjoyable employment for man or woman, for youth or old age.

SUB ROSA.

Yes, we cheerfully admit, sub rosa, that that Jewell Strawberry cut was invented in a part of the edition. A brilliant printer thought he knew Strawberries better than the editor, and in our absence just tipped the cut over. We saw the blunder just as he was flattering himself that he had done a smart thing, and the Jewell was put on its proper setting. Unfortunately, between ourselves, some of those faulty copies got into the hands of kindly men who will criticise a fault where they would never dream of praising a virtue, and have sought to make our ears tingle at their comment. But, dear youths in journalism, our skins are tough. Pelt away with your mustard-seed shot. We don't care. Look out for your glass houses, though.

Are Messrs. Vaughan and Thorpe boycotting? *The American Florist* advises that seedsmen should not advertise in papers which offer seeds and plants as premiums, and argues concerted action to this end. Verily that is brilliant. How would you like to have all seedsmen and florists refuse to advertise in *The Florist* because its owners make a business of selling seeds and plants to its readers? The cases are virtually the same. The premium seeds and plants are really sold, though at a low price, in combination with the papers offering them. Glass houses, friends! Boycotting is bad business.

One valued reader—valued because he is a subscriber!—is displeased because *THE AMERICAN GARDEN* is to cost \$2.00 a year hereafter. He says the magazine is good, and "the price is all it is worth." Bless you, dear reader, you just wait till we show you how much more valuable *THE GARDEN* is to be. Look at this issue as a beginning! Then please observe that you and everybody else may subscribe now for any number of years, and by reason of our premium combinations and the improvements in the magazine get big interest for your money. But every other subscriber who has expressed himself on the subject emphatically endorses the proposed rise in subscription price, thinking *THE AMERICAN GARDEN* well worth the money.

Rural journalism is just now enjoying a fusillade of new garden papers being fired at the public by various seedsmen, florists and publishers. *Popular Gardening* is a legitimate periodical by Ransom & Long of Buffalo, edited by Mr. Long of Landscape Gardening fame, we believe. Its name implies its character, and it is well worthy of patronage. *The Michigan Horticulturist* is edited by Chas. W. Garfield, and so of course is a worthy effort, sure to be popular in the section whose fruit growing interests it is designed to promote. *Orchard and Gardening*, edited and published by Jno. T. Lov-

ett, the brilliant nurseryman of Little Silver, N. J., is necessarily bright and interesting, like most of Mr. Lovett's work in horticulture. *The American Florist*, being especially for florists, is perhaps appropriately published by florists, with enterprising Mr. Vaughn of Chicago for leader, and Mr. John Thorpe for the proposed working editor. We welcome every honest effort to promote horticulture, but we believe that even a trade paper should be entirely disassociated with any mercantile house. It is human nature for a man to look after his own interests first. *The Mayflower* is a neat and bright little organ for that skillful advertiser, Mr. John Lewis Childs of Floral, N. Y. If we have overlooked any new claimants for public favor in this field (this garden, perhaps we should say) we should be pleased to shake pens with them if they will show us their olive branches.

American Apples are judged by quality in Europe as well as at home. It is no more use to send seconds to Liverpool than to Broadway or Faneuil Hall. Recent cable reports indicate large sales. October 5, Kings brought \$4.25 to \$4.75 per bbl. of sound fruit; Baldwins \$3.25 to \$3.75; Greenings \$3.00 to \$3.25. On October 12, prices ranged about twenty-five cents lower than the preceding at Liverpool and Glasgow, with Northern Spies, Seek-No-Further and Spitzenburgs at \$3.25 to \$3.50. On October 14 the quality and prices were lower by fifty cents on most sorts offered. Oct. 19, 6000 bbls. were sold in Liverpool under a brisk demand. Newtown Pippins were too green for the fancy trade and brought \$3.00 to \$4.50. Other prices were about the same as on the 12th, with Greenings, Spitz and Spies twenty-five cents lower. Kings in Glasgow brought \$4.25 to \$4.50. On October 21 the demand was active with prime Newtown Pippins at \$4.75 to \$5.25; other sorts the same as on the 12th; Hubbardstons at \$3.25 to \$3.50, Golden Russets \$3.00 to \$3.25. Careful selection and picking for any market always pays.

There is rank injustice even in the craft of gardening, a calling that should soften any hard heart, and make a man just. Mr. F. W. Sowby, now at 1411 Yards St., Philadelphia, is one of the sufferers. He is said to have had a good business, and under contract took a large lot of plants to no-matter-where, set them out as ordered, and—could not get his pay, which ruined him financially, and he would have suffered worse save for the charity of a certain great soap maker who is helping him along until some gentleman appears who wants a gardener. Alas that charity must help any follower of the art-beautiful to his daily bread!

Advertising is the life of trade. So runs a trade proverb, that is especially applicable to the business of seed and plant growers. No other branch of industry distributes so many or so well-printed catalogues, or spreads its advertisements so liberally. None receives or sends out so large mails. None knows so well the value of advertising. Many, in fact most, of the leading houses now employ no, or very few, travel-

ling salesmen, yet for sales depend chiefly on advertising, on catalogues and a reputation for good goods. And the winds of rumor report that during the coming season advertising will be used still more freely than heretofore; but what is more important, the larger advertisements will be confined more closely to the better class of papers and magazines.

Confidentially, dear reader, don't you think that this issue of *THE AMERICAN GARDEN* is a pretty good one? Don't you think that it would be a proper thing for you to suggest to your friend that to read it for a year would be worth something to him or her in larger returns from his land, in a more beautiful home, and in greater pleasure in the work and life of the seasons as they come? Furthermore, you can safely tell your friends that the magazine will be even better in the future than it is now, for evidence of which please show them our prospectus for 1886 in the first pages of this number. Any effort that you will thus kindly bestow upon your friends will be duly appreciated by them, by the editor and especially by the publisher.

Visitors to the Philadelphia meeting of the Society of American Florists may anticipate a treat, as Mr. Geo. W. Childs has decided to invite them to visit his beautiful place at Wootton, where of course they will be entertained as only Mr. Childs at Philadelphia can entertain a party of men and women, be they florists or princes.

PROFITABLE GARDENING.

Profits in gardening do not, as a rule, increase with the extension of the area cultivated. A few acres favorably situated near a good market, and skillfully managed, will almost always yield larger profits from the capital invested, and the labor employed, than large farms. Much of this is naturally owing to the better prices which products bring when sold direct to the consumers, but more to the fact that better care and closer attention to details can be given on a smaller scale than on a larger one. From the moment that the owner has to depute to others part of the supervision his profits will commence to diminish.

Judicious selection of a location advantageously situated to markets, and for obtaining labor, manures and other necessary supplies is as much and as important a part of profitable gardening as the growing of crops. Both must be thoroughly understood by those who would succeed. To teach our readers the principles and methods how such success may be obtained, and to inform them of the practice of those who have been most successful in their specialties, is one aim of *THE AMERICAN GARDEN*.

There is no secret, no mystery about successful and profitable gardening. Adaptation of methods and means to circumstances, studious and timely attention to details, and the same application, industry, and circumspection that lead to success in other business will surely produce satisfactory results and ample profits. All cannot succeed in any business, as not all possess the same qualifications, but to those who make themselves masters of the situation, gardening offers as liberal rewards as any calling.

METROPOLITAN MARKETS.

IN BRIEF PARAGRAPHS FOR THOSE COMMERCIALY INCLINED.

A review of the month previous to October 15th.

FRUITS.

Apples.—Golden Pippins were the handsomest and the favorite eating Apples in market. They have brought one price—30 cts ½ pk, \$1.50 a bbl; selected, \$2.00 a bbl. Gravensteins were in good demand at 40 cts a pk; Maiden's Blush are also 40 cts a pk, selected, \$2.25 a bbl. Greenings, 25 cts pk, \$1.50 a bbl; Baldwins \$1.50 a bbl; King, \$2.00. For table use the two latter sell at 35 cts per doz.

Bananas.—Yellow, 40 cts a doz, 75 cts a bunch; the supply of Red has fallen off, which advanced prices to 60 cts a doz, \$1.75 a bunch.

Crab Apples have been unusually sound, large and richly colored. The demand for preserving, making into sweet pickles and jelly annually increases. The Siberian is preferred. Price, 70 cts a pk, an advance of 20 cts on our last quotations.

Cranberries are very plentiful; have fallen from 20 to 10 cts a qt in a fortnight.

Grapes.—Isabella has not appeared on fruit stands this season. All other sorts are plentiful. Malagas arrive in abundance, mostly in good condition; 30 to 20 cts a lb. Concord cost 50 to 60 cts a 10-lb basket. Niagara and Rebecca, 30 cts a lb. Delaware have brought 20 cts a lb in the markets, and 30 cts on Broadway. Catawbas have sold for 15, 20 and 25 cts a lb. California Tokays are \$1.50 for a 5-lb box, or 35 cts a lb. The light-colored domestic Grapes were 10 cts a lb. Hothouse Grapes cost \$1.50 to \$2.00 a lb. There has been but slight fluctuation in the price of Grapes in a month.

Lemons.—Messinas are scarce at 30 to 35 cts a doz, \$4.50 and \$5.50 a box. Floridas, 25 and 30 cts a doz, \$4.00 and \$4.50 a box.

Limes are much in demand at 15 and 20 cts a doz.

Oranges.—Jamaicas are best now, having gradually improved. They retail at 60 to 70 cts a doz; by bbl, \$6.50 and \$6.75. Messinas 40 to 65 cts a doz, \$4.30 a box.

Pomegranates find a fair sale at 10 to 15 cts each. They have a peculiarly tart and cooling flavor that is refreshing to feverish invalids.

Peaches have been excellent though now pale and wrinkled. The "Salway" is an excellent late yellow sort that has been preferred to Smocks. They have cost \$2.00 a basket. Crawford's have ranged at \$2.25 to \$4.50 a basket; Smocks \$1.75 to \$2.50; small New Jersey Rarieripes \$2.00 to \$2.50 a basket; White Heath for preserving, \$1.25 to \$2.50 a basket. This fruit kept in cold houses along the Hudson, will appear until December in Broadway stores, and will bring a large price.

Pineapples.—A few Havana Pines appear at 30 to 70 cts each.

Pears.—Seckels cost 75 cts and \$1.00 per pk basket early in the month; now \$1.75 and \$2.00. Vicar of Wakefield and "Pound" Pears for preserving, are 40 cts a pk. Duchess, Sheldon and Bartlett, selected for table use, bring 40, 50 and 75 cts a doz.

Plums have been unusually plentiful and lasted satisfactorily. German Prune Plums have sold from 20 to 35 cts a qt. Magnum Bonum and Golden Drop cost 25 cts. Dunsions have ranged from 30 cts to \$1.75 a pk.

Quinces.—Three varieties have been in market over a week, the Apple, Pear and Orange Quinces. The former are preferred and bring 75 cts per basket of 19. Smaller fruit, 40 to the basket, bring 50 cts. The ordinary run sell for \$1.25 a bush.

Wintergreen berries are in good demand; 20 cts qt.

Nuts.—From Donalque come the pits of Cashaw fruit, which are rich, sweet and delicious when roasted. The nut is crescent in shape and is in flavor between a Peanut and Almond; \$1.00 a lb.

VEGETABLES.

Aquarte or Alligator Pear, from Havana, is somewhat like a Cucumber in flavor, and makes a refreshing salad. It has a tough, green, smooth skin, and large pit. 30 cts each, 4 for \$1.00.

Artichokes.—From France, 25 and 30 cts each.

Beets remain at 5 cts bunch, \$3.00 a 100 bunches.

Brussel's Sprouts, imported 50 cts a qt, \$7.00 a bush; American, 25 cts a qt, \$3.50 a bush.

Beans.—String Beans are 20 cts a small measure, Butter Beans same. Limas 15 cts a qt, \$1.50 a bag.

Cauliflowers are excellent from Long Island at 5 to 30 cts each, according to size, \$1.50 to \$4.00 a bbl of 15 to 50 heads.

Cresses are 3 and 5 cts a bunch, not now sold by qt. **Cabbages** are 7 to 12 cts each, average \$1.25 a doz at retail.

Corn.—Sweet Corn is prime and plentiful; 15 cts a doz, \$1.50 per 100 ears.

Celery is plentiful at 10 cts a bunch, \$1.00 a doz.

Carrots remain at 5 cts a bunch, \$1.50 a bbl.

Egg Plant, plentiful and fine, 5 cts each, 50 cts doz.

Cherries are very scarce, particularly the small ones; 30 cts per 100.

Herbs.—New herbs cost 2 cts a bunch for Thyme, Sage, Sweet Marjoram and Summer Savory. For Chervil and Tarragon, 5 cts is charged.

Lettuce is delicate and tender, and is what is called "Boston;" 5 cts for 2 heads.

Mushrooms.—Field Mushrooms have brought 50 cts to \$1.00 a lb, hothouse ones \$1.50 a lb. At present they are all out of market.

Nasturtians are in brisk demand for pickling; 40 cts a qt.

Okra.—Green Okra, 60 to 75 cts per 100, now 60 cts. Large quantities have been sent from Havana, but it was too early to bear transportation, and it was yellow and tough; 25 cts per 100.

Onions are 10 cts a qt for white, and 8 cts for red. The latter are \$2.75 a bbl, and the former are \$3.50 a bbl. Small, white, pickling Onions bring 25 cts a qt. Spanish Onions are 10 cts a qt for small ones; large ones sell by the lb at 5 to 10 cts, according to the locality where purchased.

Oyster Plant is \$1.00 and \$1.25 a doz bunches, 15 to 20 cts a single bunch. It is unusually large of stalk and tender.

Potatoes.—Potatoes are prime only in certain localities; those grown in sandy soil are excellent, but many of those from clayey districts have dry rot. Long Island Early Rose, Beauty of Hebron, Burbank and Queen of the Valley are offered as the safest to purchase; \$2.00 to \$2.25 a bbl retail, \$1.50 to \$1.75, wholesale.

Potatoes, sweet, from Delaware and Virginia are in equal demand, at 15 cts per lb or small measure; \$2.00 and \$2.50 a bbl. New Jerseys are inferior at 10 cts a small measure.

Peas.—Green Peas are excellent, selling for 30 cts ½ pk and \$2.25 a bag.

Peppers.—Chili Peppers for pickling are 60 cts a qt, Spanish 5 cts each.

Parsnips, large and fine; 5 cts a bunch, \$3.00 a bbl.

Radishes are crisp and tender: one et a bunch; they have varied from 3 to 4 cts a bunch for a fortnight.

Squash.—Marrows are 10 and 15 cts each, according to size; Crook-necks, 5 cts each.

Turnips.—Yellow or Russian cost 8 cts a bunch. White bring 10 cts a bunch, \$1.80 a bbl.

FLOWERS.

Chrysanthemums.—Plants in bloom are 50 cts to \$3.00, according to size and variety. There are few standards offered, the cut pompons being 25 cts a doz at retail.

Carnations.—Buttercups are the costliest; at wholesale \$2.00 per 100, at retail, 5 and 7 cts each. Hinsdale, La Purite and Grace Wilder, cost \$1.50 per 100, wholesale, 4 to 5 cts each, retail. White Carnations wholesale at \$1. a 100, 2 cts each, retail.

Lily of the Valley brings \$8.00 per 100, wholesale, and double that at retail. Selected spikes for weddings are sold at fancy prices.

Mignonette is not handsome as yet, but is loved for its odor, and the "Spring-flower clip" it bestows on a bouquet; 15 and 20 cts a bunch wholesale, 25 cts retail. A "bunch" is 12 spikes.

Roses.—The Bennett Rose ranks all others in price, costing \$10.00 per 100 wholesale, retail \$2.00 a doz. American Beauty brings but \$1.00 a 100 wholesale, \$1.50 a doz retail. La France are \$8.00 per 100; selected, very large, \$20.00 a 100. At retail they bring from \$1.50 to \$3.00 a doz. Ten Roses are 75 cts a 100 and retail for \$1.00 a doz. Perles des Jardins are \$1.50 per 100 and \$1.00 a doz. Cornelia Cooks cost \$8.00 per 100, wholesale, and retail for \$1.50 a doz.

Smilax is 15 cts a string wholesale, 25 cts retail.

Violets.—Marle Louise are just appearing. They cost 50 to 75 cts a bunch wholesale, retail for \$1.00 and \$1.50. Bushy Violets are 50 cts per 100 wholesale, 75 cts retail.

NOVELTIES.

Under this heading we propose to notice all new varieties of Fruits, Vegetables, Flowers, and Ornamental Shrubs and Trees introduced by reliable houses here and abroad. We wish to have it distinctly understood, however, that the fact of a novelty being mentioned here does not imply our endorsement or recommendation of the same, the descriptions being mostly those of the originators or introducers. This column is intended merely to serve as a record of the novelties of the day.

FRUITS.

Grape.—"Nectar," B. F. Merriam, O. A chance seedling; white, large bunches, excellent quality, productive, earlier than Concord.

Lemon.—"Bonnie Brae," H. M. Higgins, San Diego, Cal. A seedling of the Sifly Lemon; rind very thin; pulp tender, exciting; rich flavor.

Peach.—"Ford's Late White," John Perkins, Moorestown, N. J. Claimed to be the latest white freestone Peach in cultivation.

Peach.—"The Globe," Christopher Shearer, Tuckerton, Pa. Freestone, golden yellow with red blush; the best, largest, and most prolific variety for that section.

Pear.—"Mahoning," M. Milton, Mansfield, O. Resembles Fred Chapp in appearance, but is much larger and better flavored. A thrifty grower, bearing early.

Plum.—"Botan," introduced from Japan. Purple, large; tree a strong, handsome grower, with large, glossy foliage.

Plum.—"Desotto." This was first introduced by W. P. Rupert of Seneca, N. Y.

Plum.—"Moore's Arctic," F. P. Sharp, Woodstock, N. B. Described as wonderfully prolific, hardy, and ear-culic-proof.

Plum.—"Simon." Introduced from the Orient. Prof. Budd says of it: It will be the King of fruits—better than any Apricot.

Raspberry.—"Key's Prolite," Black Cap. Equal to any of the best standard varieties, and superior in flavor.

Strawberry.—"Sunapee," Susan P. Fowler, Vineland, N. J. Early, sweet, fine flavor, vigorous plant, perfect flowers.

VEGETABLES.

Potato.—"Early New Zealand," W. M. Beminger, Walnutport, Pa. Claimed to be ten days earlier than Early Rose.

Potatoes.—Out of forty-two new kinds competing at the recent International Potato Exhibition in London, England, only four were considered worthy of Certificates. These were "New Flake," from M. Ironsides; "The Colonel," from W. W. Johnson & Son; "Faith," from Robert Fenn; and "General Gordon," from C. Fidler.

(See also page 263.)

SAVORS OF THE SOIL.

HOOKE, HARROWED AND HARVESTED.

How to start a greenhouse: try a cyclone.

When a man gets hard up for provision, it is mighty risky to let your hens run in his garden.

Prairie land is generally barren of timber. When you are in the woods it is reasonable to believe that you are not on the prairie.

Some one writes inquiring if guano is good to put on Potatoes. It may do for those who like them that way; gravy and butter are considered better.

Small boy, watching his sister iron a piece of work with a bird's nest of eggs done in crowels on it: "I say, sister, if you keep the iron so long on those eggs, you'll hatch 'em!"

Land agents always tell the truth. Some time ago one agent was suspected of telling a lie, but upon investigation it was found that the landgrant had simply misunderstood him.—Arkansas Traveller.

Our

THE AMERICAN GARDEN one year
 OUR COUNTRY HOME one year
 GOOD CHEER one year

Irresistible

for \$1.25

Offers.

If ordered before
 JANUARY 1, next.

A year's subscription to *Our Country Home*, or to *Good Cheer*, will be given to any one who sends in a new subscription to *The American Garden*, and the same to the new subscriber; Both of them to any one who sends in 2 new subscriptions to *The American Garden*, and the same to both of the new subscribers.

After Jan. 1 the subscription price of *The American Garden* will be \$2.00.

GOOD CHEER.

OUR COUNTRY HOME.

Good Cheer is one of the most popular home and family papers in the world. It is pure, clean, bright, wholesome, sparkling, helpful; full of good sense, good morals, good fun, good literature, good cheer, choice stories, anecdotes, poems, biography, history, useful information. Edited by Kate Upson Clark, assisted by a corps of literary talent equal to that of the great magazines: 20 to 24 pages, monthly: well-printed on good paper. In a little over three years' time it has grown to 100,000 circulation. (Price 50 cents.)

Our Country Home, a monthly journal of agriculture and country life, is one of the greatest successes among all farm papers. Acknowledged to be one of the best, most reliable, best edited and brightest papers of its class. Edited by E. H. Libby, assisted by F. D. Curtis, E. S. Goff, F. D. Coburn, I. K. Felch, E. E. Rexford, and Mrs. Mary C. Hungerford, with numerous equally able contributors. Full departments on the Field, Garden, Dairy and Stock, Poultry, Swine, Law, and Home and Public affairs. (Price 50 cts.)

Sample copies of these two papers will soon be sent to our readers.

Separately the three periodicals cost \$2.00; together only \$1.25; after January 1, \$3.00.

OUR PREMIUM COMBINATIONS.

Books on Gardening.

Choice Special Periodicals.

A Few Choice Implements.

We have taken special pains in the selection of the following books and periodicals, etc., and, so far as we know, there has never been a more attractive series of combinations offered to people interested in Horticulture.

The form and method of the offers is, we think, ENTIRELY NEW. (a.) We quote a price for THE AMERICAN GARDEN together with the article mentioned, and (b.) we also offer each article as a premium for a club of subscriptions.

It will be seen that the prices first named are in most cases the usual price of the premium alone.

(a.) (b.) WHO CAN GET THE PREMIUMS?—The offers (a) at the head of the paragraphs are for either old or new subscribers. The offers (b) at the foot of the paragraphs for one "new" subscription are only to those who are themselves subscribers; the clubs of two or more may include the sender's name.

Please send orders to our Greenfield Office.

1.—(a.) For \$5.00, *The American Garden* 2 years (or 2 subscriptions) and

Downing's Fruits and Trees of America; Or, the Culture, Propagation and Management in the Garden and Orchard of Fruit Trees generally. With descriptions of all the finest varieties of Fruits, native and foreign. Second revision and corrected. By A. J. Downing. Over 1100 pages, with cultivated in this country. Over 1100 pages, with several hundred outline engravings, with latest Supplements. It contains the names and synonyms of over 10,000 varieties. 8vo cloth. (Price \$5.00.) Add 25 cts. for postage.

"As a work of reference it has no equal in this country, and deserves a place in the library of every pomologist in America."—*Marshall P. Wilder*.

2.—(a.) For \$2.00, *The American Garden* 1 year, and

Downing's Selected Fruits. Price \$1.50. This is abridged from *Downing's Fruits and Fruit Trees of America*. With some new varieties, including their Culture, Propagation and Management in the Garden and Orchard, with a guide to the selection of Fruits, with reference to the Time of Ripening. By Charles Downing. Illustrated with upwards of 400 outlines of Apples, Cherries, Grapes, Plums, Pears, &c. None but Choice and Tested Fruits are named, and with synonyms amount to over 2,500 varieties. 12mo cloth. Add 10 cents for postage.

(b.) Given as a premium, sent prepaid, for 3 subscriptions at \$1.00 each.

3.—(a.) For \$5.00, *The American Garden* 2 years (or 2 subscriptions), and

The Illustrated Dictionary of Gardening. Vol. I. (Price \$5.00.) A Practical Encyclopaedia of Horticulture, for Gardeners and Botanists. By G. Nicholson and able assistants. To be completed in three volumes. A Unique and Exhaustive Work, in which the practical information and Botanical classification have been brought down to present date. The number and beauty of its illustrations are without a parallel in any book on Gardening. Over 2,000 first-class Engravings will be given in the complete work. Vol. I, A to E, now ready. Cloth, 4to. 520 pages. Add 25 cents for postage.

(b.) Given as a premium, one volume, for 10 subscriptions to *The American Garden* at \$1.00 each. Add 25 cts. for postage.

4.—(a.) For \$3.00, *The American Garden* 1 year, and

Barry's Fruit Garden. (Price \$2.50.) Add 15 cts. for postage. A standard work on Fruits and Fruit Trees; the author having had over 30 years' practical experience at the head of one of the largest nurseries in this country. New Edition, revised up to date—Invaluable to all Fruit growers. By P. BARRY. Illustrated. Cloth, 12mo.

(b.) Given as a premium for 5 subscriptions to *The American Garden* at \$1.00 each. Add 15 cts. for postage.

5.—(a.) For \$2.00, *The American Garden* 1 year, and

Thomas' American Fruit Culturist. (Price \$2.00.) New, Revised Edition, with practical directions for the Propagation and Culture of all Fruits adapted to the United States. By John J. Thomas. Illustrated with 519 Fine Wood Engravings. In one handsome 12mo volume of 533 pages, bound in extra Muslin. In the present (nineteenth) edition, a general revision of the work is made throughout, and among the added portions are descriptions of the newer Strawberries, Raspberries, Peaches and Grapes; lists of some of these fruits once famous, but now passing out of cultivation; directions for pruning orchards; construction of fruit houses and the best modes for storing fruits; new illustrations of budding and grafting; management of Orange groves in Florida; and a thorough revision of the Descriptive List and Index by the addition of new sorts. Add 15 cts. for postage.

(b.) Given as a premium for 3 subscriptions to *The American Garden* at \$1.00 each. Add 15 cts. for postage.

Continued on page 279.

WOMEN WORKERS IN THE GARDEN AND FIELD.

Susan Power tells of a woman gardener who made \$3,000 on one acre of land, presumably from flowers and plants.

A New Jersey woman is one of the most successful small fruit growers in that fruit growing State. We hope to give our readers the particulars of her enterprise.

Indiana has 2,252 women engaged in the honorable occupation of farming; 66 author-esses; 532 boarding-house keepers; 107 book agents; and in the other vocations women are well represented.

A lady at Whitby, England, boasts of a Marshal Niel Rose tree eighteen years old, which now measures horizontally 48x54 feet. The average depth is five or six feet, and last year 2,500 Roses were plucked from it.

It is worth everything to a woman, if by misfortune it becomes necessary for her to look after property, and to take care of herself, to have some practical knowledge of what she has to do.—*Col. F. D. Curtis.*

Women are the most successful retail dealers in fruits and flowers, on account of their care in selecting the best specimens for their counters. There is a woman in Boston who from a little out-door fruit stand, has become "well off" by getting a reputation for the best. She is not the traditional Apple woman, but looks as neat, fresh and attractive as her wares.

Women who are not exactly "workers in the field," are the Dakota girls who are "holding down" quarter sections. Under the law, if they put up a shanty on a quarter section of land and sleep in it one night a month for six months, and then make some improvement on it during every six months for five years, it is their land. And it is said that many are found ready to practice "equal rights" with men in this easy getting of real estate.

We know a farmer's daughter in Bucks county, Pa., who had two turkey hens this year from which she got and set 113 eggs. The pigs destroyed two nests of eggs after they were set for incubation; but she succeeded in getting sixty young ones raised in spite of wet weather, bad luck, and the usual vicissitudes of the business. She says she is going to get enough of money out of her two turkey hens to buy herself a first-class sewing machine by Christmas, besides having a nice turkey for Thanksgiving and one for Christmas dinner.—*Farm Journal.*

In France, a farmer's daughter becomes the head of the dairy. She knows nothing about decorating ginger jars or strumming waltzes on the piano, but she turns out of her skilful fingers delicate cheeses and butter, which command the highest price in the Paris and London markets. So high do the Breton dairies rank, simply in consequence of the personal supervision of them by the farmers' wives and daughters—women with intelligence as well as hands—that it is not uncommon for a dairyman to give his daughter a dower of from \$15,000 to \$20,000; much of it the product of her own skill in detail work and management.—*Tribune.*

Answers to Correspondents.

Covering Grapevines.—*Q., New York.*—Loosen the vine from the trellis, lay on the ground and cover with a few inches of soil, especially the ends of the canes.

Stephanotis not blooming.—*J. C. H., Los Angeles, Cal.*—In rich soil this plant is apt to run too much to foliage to the loss of flowers. It needs full sunlight, and should be trained close to the glass; it bears severe pruning, and after the plant has covered the space devoted to it, all the strongest shoots should be cut back every year in December or January.

William Francis Bennett's Rose.—*Subscriber, St. Louis, Mo.*—This Rose was produced by Henry Bennett at Shepperton, Walton-on-the-Thames, London, England. The stock offered in America was bought by Chas. E. Evans, of Philadelphia, Pa., for \$3750, under the restriction that none of the plants should be sold before four years. This time having elapsed plants may now be had from all leading florists and nurserymen. For description and illustration see June number of this year.

Propagating Azaleas, etc.—*F. C., Elyria, O.*—Our greenhouse Azaleas, *Azalea indica*, are easily propagated in spring, by cutting of the half-ripened young shoots.

Poinsettias are increased by cuttings in May. The cuttings should be allowed to dry a day or two before planting, when they may be set in small pots, or in a propagating bench, and transplanted after becoming rooted.

Culvercularia are raised from seed sown in August, and as soon as the young plants are of sufficient size to handle, they are transplanted to separate pots. To produce bushy plants the center stem should be pinched out.

An occasional 40° below zero does not make outdoor growing of Hyacinths an impossibility, provided the ground is dry, and the bed is covered with 12 inches of loose leaves or straw. The bulbs may also be planted in pots now, kept in a cool cellar during winter, and in spring be planted out, without disturbing the bulb.

Various Floral Queries.—*T. C. P., La Prairie, Canada.*—A Lemon Verbena that has been growing all summer needs rest in winter like any other deciduous shrub. The best place to winter it is a frost-proof cellar.

The hardier Magnolias should survive your winters without protection, we should think. Small trees may be easily protected by tying evergreen branches around them.

There are a great many species and varieties of Jasmines; among the most desirable are: *J. grandiflorum, gracile, undulatum, Azoricum, officinale, multiflorum, odoratissimum, andeflorum*, etc.

Cestrum nocturnum is an old plant that any leading florist should be able to procure.

Trade Notes.

ITEMS OF GENERAL INTEREST FROM THE SEED, NURSERY AND FLOWER TRADE ARE SOLICITED.

E. A. Reeves, 60 Cortlandt St., New York, has sold out to J. M. Wells.

John Lewis Childs, Floral, N. Y., has increased his facilities by 5,000 feet of glass.

The Cucumber and Melon seed crops seem to be large, except in the light seedling sorts.

Chas. L. Mitchell has erected large Rose forcing houses at Oakley near Chelmsford, having a capacity of 7,500 plants.

F. R. Pierson, Tarrytown, N. Y., has had so large a trade in Easter Lily plants this fall that his stock is exhausted.

B. K. Bliss is looking better than we ever saw him before; the result of a long rest in Europe and at East Bridgewater, Mass.

P. M. Angus & Son report a great demand for the Jewell Strawberry plants for spring delivery, and they expect to sell 100,000 of them.

A. J. Caywood & Sons, Marlboro, N. Y., have had a good trade this year. Their new varieties of Grapes and the Raspberry take well.

Jos. Breck & Sons, Boston, this fall imported three times as many Holland bulbs as last year, and now report their supply fast being exhausted.

The Matthews plows are taking well with Eastern market gardeners. But it is doubtful if they ever have so great a popularity as the Matthews seed drill.

R. & J. Farquhar & Co., Boston, are having excellent success in selling the new Monarch Rhubarb, which is propagated by the paternal hands in Scotland.

Some skilled florists think that the Bennett Rose is one of the best yet for forcing, ranking with the first in the list. Mr. Evans struck a good thing in importing it.

Young & Elliott's pulverized sheep manure is pronounced by H. P. Hubbard of New Haven as being the best thing he has tried for making Roses bloom freely, and for making potting soil.

Peter Henderson says he saw but few novelties in Europe, during his recent trip, that were especially remarkable. But he saw many interesting things which he promises to tell our readers about soon.

The Niagara White Grape is still held at \$2.00 per vine by the N. W. G. Co., and those most interested in its dissemination; but some outside parties are advertising it freely as low as seventy-five cents a vine.

Autumn opened auspiciously in the fruit and vegetable markets, after the usual languor of summer. Preserving season brought a rush of customers and the "return of the native" has made an unusual stir in all departments. The flower trade is still dull, because entertainments have not yet started. The demand is almost entirely for Roses and Chrysanthemums. Few of the latter are brought in and those are bushes in bloom, about 24 inches high and well covered with blossoms, while Chrysanthemums so far are scarce.

STRICTLY RELIABLE ROOFING.

All our readers who are troubled with a leaky roof or have a new roof to lay on dwelling, barn, shed or other building should write at once to Indiana Paint & Roofing Co. (New York or Indianapolis, Ind.) for their illustrated catalogue, and samples. Mention AMERICAN GARDEN.

GOOD WATER.

The Waukesha Glenn water advertised in this issue is one of the very finest of all table waters, and is fast becoming known as a specific for many diseases of the stomach and bowels. It seems like "carrying coals to Newcastle" to bring spring water from the West to the East, but the Waukesha Glenn is gaining many converts to its virtues in all sections.—*Adv.*

THE FLORAL WORLD.

This superb, illustrated magazine is now recognized as the best Floral Monthly published in America. It specializes the curiosities and beauties of the Vegetable Kingdom. Correspondence from all parts of the world. Specimen copy and packet Finest Mixed Pansy seed mailed on receipt of three 2-cent stamps. Address Floral World, Highland Park, Chicago, Ill. THE AMERICAN GARDEN and the Floral World one year for \$1.25.—*Adv.*

WE HAVE just received the Premium List of THE PHILADELPHIA WEEKLY PRESS, and it is certainly the best piece of work it has ever been our good fortune to see. How THE PRESS can offer such inducements is a mystery. We advise all our readers to send for a copy and examine it. Among their premiums they offer the World's Cyclopedia and THE WEEKLY PRESS one year for \$1.75.—*Adv.*

TILLINGHAST'S PUGET SOUND CABBAGE SEEDS are being planted by many of the largest truckers in the South in preference to all others. Mr. F. M. Duncan, Proprietor of the Cotton Planter's Seed Store, Dallas, Tex., after using and selling them writes: "The P. S. Cabbages are all that can be desired. They germinate well and the plants are vigorous and healthy. The heads are very large, solid and sound. Every one who has tested them speaks in the highest terms of them. They are sure to supplant all others." For particulars and prices of this famous seed, address Isaac P. Tillinghast, La Plume, Pa.—*Adv.*

**COLGATE & CO'S
CASHMERE BOUQUET PERFUME.**

This is one of the richest, most lasting, and refined of all handkerchief perfumes. The name and trade-mark of

COLGATE & COMPANY

on every bottle assure purchasers of superior and uniform quality.

THE CENTURY for 1885-86.

The remarkable interest in the War Papers and in the many timely articles and strong serial features published recently in *THE CENTURY* has given that magazine a regular circulation of

MORE THAN 200,000 COPIES MONTHLY. Among the features for the coming volume, which begins with the November number, are:

THE WAR PAPERS

BY GENERAL GRANT AND OTHERS. These will be continued (most of them illustrated) until the chief events of the Civil War have been described by leading participants on both sides. General Grant's papers, to appear soon, include descriptions of the battles of Chattanooga and the Wilderness. General McClellan will write of Antietam, General D. C. Buell of Shiloh, Generals Pope, Longstreet and others of the Second Bull Run, etc., etc. Naval combats, including the fight between the *Kearsarge* and the *Alabama*, by officers of both ships, will be described.

The "Recollections of a Private" and special papers of an anecdotal or humorous character will be features of the year.

SERIAL STORIES BY

W. D. HOWELLS, MARY HALLOCK FOOTE AND GEORGE W. CABLE.

Mr. Howells's serial will be in lighter vein than the "Rise of Silas Lapham." Mrs. Foote's is a story of mining life, and Mr. Cable's a novelette of the Acadians of Louisiana. Mr. Cable will also contribute a series of papers on Slave songs and dances, including negro serpent-worship, etc.

SPECIAL FEATURES

Include "A Tricycle Pilgrimage to Rome," illustrated by Pennell; Historical Papers by Edward Eggleston, and others; Papers on Persia, by S. G. W. Benjamin, lately U. S. minister, with numerous illustrations; Astronomical Articles, practical and popular, on "Sidereal Astronomy"; Papers on Christian Unity by representatives of various religious denominations; Papers on Manual Education, by various experts, etc., etc.

SHORT STORIES

By Frank R. Stockton, Mrs. Helen Jackson (H. H.), Mrs. Mary Hallock Foote, Joel Chandler Harris, H. H. Boyesen, T. A. Janvier, Julian Hawthorne, Richard M. Johnston, and others; and poems by well-known poets. The Departments, "Open Letters," "Bric-à-Brac," etc., will be fully sustained.

THE ILLUSTRATIONS

Will be kept up to the standard which has made American wood-engraving famous the world over.

The Century now appears on the first day of the month.

PRICES. A SPECIAL OFFER.

Regular subscription price, \$4.00 a year. To enable new readers to get all the War Papers, with contributions from Generals Grant, Beauregard, McClellan, J. E. Johnston, Lew Wallace, Admiral Porter and others, we will send the 12 back numbers, November, 1884, to October, 1885, with a year's subscription beginning with November, 1885, for \$6.00 for the whole. A subscription, with the 12 numbers bound in two handsome volumes, \$7.50 for the whole. Back numbers only supplied at these prices with subscriptions.

All dealers and postmasters take subscriptions and supply numbers according to our special offer, or remittance may be made directly to *THE CENTURY CO.*, NEW YORK.

Mention *THE AMERICAN GARDEN*.

THE FLYING INDIAN.

A Wonderful Mechanical Toy. Makes a flying leap of TEN FEET in the air. Yellow Wings, Green Body. Everybody goes wild when it flies. Any child can start it. You can have hundreds of Fun and Wagon loads of Merriment with this little toy. It is fun for old and young folks.

Good Housekeeping (1 year). (Price \$2.50.) A semi-monthly journal "Conducted in the Interest of the Higher Life of the Household." Conducted in a spirit of real love for the promotion of "the homes of the world," and executed by some of the wisest and brightest of practical men and women who have ever worked for this good cause. Good Housekeeping merits the warm reception and great success it is meeting with. Illustrated, and beautifully printed on fine paper. (Price \$2.50.)
(b.) Given as premium for 5 subscriptions to *The American Garden* at \$1.00 each.

14.—(a.) For \$1.20, *The American Garden 1 year, and*
Green's Fruit Grower (1 year), a quarterly journal of fruit culture. Bright, reliable, full of solid information and good sense, written in a style that it is a real delight to read; and the book, How to Propagate and Grow Fruit, by Chas. A. Green, well written and thoroughly reliable, covering all phases of the subject. (Price of paper and book 50 cts. each.)
(b.) Given as premium for 1 new subscription to *The American Garden* at \$1.00.

A FEW CHOICE IMPLEMENTS.

15.—(a.) For \$3.00, *The American Garden 1 year, and*

Little Detective Postal Scale. (Price \$3.00.) Weighs 1/4 oz. to 25 lbs. Hundreds of thousands sold. The best of all low-price scales; equal in value to any \$5 or \$10 scale we have seen. For House or Office it is equally efficient. One side of the beam shows the cost of postage in cents of any article weighed. Specially fine for seedsmen and

nurserymen. Sent by express.

(b.) Given as premium for 5 subscriptions to *The American Garden* at \$1.00 each.

16.—(a.) For \$18.00, *The American Garden 5 years, and*

Stevens' Hunter's Pet Rifle. (Price \$18.00.) Weight about 5 1/4 lbs.; length of barrel, 18 inches, good for 40 rods; 22 rim, 32, 38 or 44 calibre; rim or central fire; with combined sights. That it is made by J. Stevens & Co., is proof of its quality. A specially first made for a geological surveying party going to the Rocky Mountains, who wanted a gun to knock over a bear, which would be as light and portable as possible. Each gun thoroughly tested and remarkably accurate. With it you can knock over a woodchuck or animal of similar size, 50 rods away, with great certainty, and some state that they do even better work at a quarter of a mile away. All of the "STEVENS" arms are made for every day folks, and at a price within the reach of all; require no fixings and no previous knowledge of arms; no special cartridges. Sent by express.

The publisher of this journal has always loved a gun and began to shoot at 10 years of age, though hard work and the business of life has kept him from this pleasure in late years. But he thinks that boys should be early taught the proper use of guns, and that only good guns should be put into the boy's hands. That is one motive for making this offer, and for selecting so good and low-priced a weapon as the "Stevens' Hunter's Pet."

(b.) The 18-inch "Pet" given as a premium for 30 subscriptions at \$1.00 each.

17.—(a.) For \$12.50, *The American Garden 4 years, and*

Stevens' Single Barrel Breech-Loading Shot-Gun. (Price \$12.50.) With forehand stock and Stevens' patent bolt; 12, 14 or 16 gauge; weight 6 to 7 lbs.; length of barrel 28 to 32 in.

[Testimonial:] 575 GREENWICH ST., N. Y.

My Single Barrel needs a new catch. I had it this summer down in Virginia, and used it in preference to my double gun, and I don't want anything better as to shooting qualities. It has been shot in the past, two years over 2000 times, and has required no repairs since I bought it.

Sent by Express. ROBT. GORDON.

(b.) Given as premium for 20 subscriptions to *The American Garden* at \$1.00 each.

18.—(a.) For \$1.75, *The American Garden 1 year, and*

Maher's Common Sense Knife. (Price \$1.00.) A Jack Knife, a Pruning Knife, a Budding Knife, all in one. No knife ever met the wants of so many people as this has done; there are thousands in use by fruit growers and nurserymen, from Maine to Texas and in

orange groves of Florida and California. Sent postpaid.

(b.) Given as premium for 2 subscriptions at \$1.00 each.

19.—(a.) For \$1.40, *The American Garden 1 year, and*

Ladies' Pearl Handle Pen Knife. (Price 65 cts.) A beautiful knife, 2 blades of the best quality. Size of cut. Made by Maher & Grosch, which is sufficient guarantee of quality. Sent postpaid.
(b.) Given as premium for 1 new subscription of \$1.00.

20.—(a.) For \$1.50, *The American Garden 1 year, and*
Six Books, in paper covers. These are valuable little manuals, viz., No. 1. Flowers in Winter, all about house culture of plants; No. 2. The Flower Garden I, how to grow plants out-doors; No. 3. The Flower Garden II, hardy shrubs and ornamental plants; No. 4. The Vegetable Garden, a handy guide to the kitchen garden; No. 5. Luscious Fruits, the culture of small fruits for family use; No. 6. The A. I. Poultry Book, poultry keeping for profit.

(b.) The 6 books given for 2 subscriptions to *The American Garden* at \$1.00.

J. F. INGALLS, Lynn, Mass.

WEBSTER'S PRACTICAL

Probably all of our readers have occasion to use a dictionary every day. In some cases words cannot be correctly spelled; in others, the pronunciation is difficult; while in still other cases the meaning is not understood. This is true, not only of children and of the uneducated, but of many of the more intelligent as well; and every one who attempts to do without Webster's Practical Dictionary attempts to do without one-half of his opportunities for intellectual improvement. Webster's Practical is an entirely new work by the editors and publishers of Webster's Unabridged and contains more than twice the amount of matter and illustrations ever before offered for the price.

Horse.
1, ears; 2, forelock; 3, forehead; 4, eye; 5, eyelid; 6, nose; 7, nostril; 8, point of nose; 9, lips; 10, upper jaw; 11, cheek; 12, poll; 13, mane; 14, withers; 15, parotid glands; 16, throat; 17, neck; 18, jugular vein; 19, shoulder; 20, chest; 21, ribs; 22, back; 23, loins; 24, hip; 25, flank; 26, belly; 27, haunch; 28, thigh; 29, buttock; 30, stifle; 31, leg; 32, tail; 33, hock; 34, cannon or shankbone; 35, arm; 36, knee; 37, passage for the girthing; 38, elbow; 39, shank; 40, hula; 41, pastern; 42, coronet; 43, foot; 44, hoof; 45, fetlock.

It also embodies several entirely new features which render it pre-eminent to such a degree that for general reference in every household, it will not pay to use even the best of the older works any more than it would pay to journey across the continent in a lumbering old stage-coach while the numerous advantages of a lightning express are available.

The price is only \$1.00, but by arrangement with the sole agent, S. S. Wood, 134 1/2 West 33d St., New York, we are enabled to make this remarkable offer.

It will be sent with THE AMERICAN GARDEN, for only \$1.35 (add 10 cts. for postage). Send orders only to the publisher of THE AMERICAN GARDEN.

Nearly 1,500 First-Class Illustrations in Webster's Practical.

USE THE ONLY PURE WAUKESHA WATER.

WAUKESHA GLENN,

"QUEEN OF WATERS."

HIGHEST AWARDS OVER ALL OTHER WATERS, NATURAL OR ARTIFICIAL, AS A CURE FOR TROUBLES OF THE LIVER, KIDNEYS, BLADDER, ETC.

"PURE WATER is only to be obtained from NATURAL SOURCES."—Vide Lancet, July 7, 1882.

The dangerous qualities of contaminated drinking water are not obviated by the addition of wines or spirits.—Medical officer Privy Council, England.

Pure water is even more important than pure milk.—New York Herald. The drink of the future.—Moody.

Helped more than two years' skillful treatment.—Samuel Stevens.

I am a living advertisement for this excellent water.—W. Wilson.

Cured of Bright's Disease.—W. Hathaway.

The best merits all praise.—Hon. Geo. H. Peabody.

May the Glenn Spring continue to run Pure Water for ever and ever.—D. W. C. House.

"WAUKESHA GLENN" reigns alone among Natural Dietetic Table Waters. Its numerous competitors appear to have, one after another, fallen away until it has no rival.

With hales, gentlemen, and bon vivants everywhere it has become the standard of dietary expedients, fortifying the digestive functions, and enabling free livers to indulge with impunity at the table. The world of wealth, intelligence and refinement testifies to its sparkling, naturally pure and delightful qualities, as the beverage incomparable, and accredits it health and exuberant spirits. Endorsed by the Medical fraternity. It has been tested by thousands, whose uncollected testimonials are open to the public, and furnished to all who desire. MAILED FREE.

ADDRESS

T. H. BRYANT, WAUKESHA, WIS.

Waukesha is a delightful Summer Resort, on the Chicago, Milwaukee and St. Paul, and Chicago and Northwestern Railways.

THE AMERICAN GARDEN,

Owned, Edited and Written by Practical Men, for Practical People.

SOME NEW FEATURES.

LANDSCAPE GARDENING.

Illustrations of Country Places, with descriptions of their interesting points, to be begun at once, will be continued through the year. The series will include the places best adapted to show the proper way to plan and beautify the home grounds, not only for the very wealthy, but also for the family of moderate means.

OUTDOOR DECORATION

Of the Village, suburban and country homes of working men and women, by use of the means Nature provides in Vines, Ornamental Plants and Flowers, will be preached in five-minute sermons by lay workers.

LARGE PROFITS.

Profitable fruit growing and gardening is the great object of horticulture: profit in money, profit in health, profit in comfort, profit in beauty and profit in happiness. THE AMERICAN GARDEN seeks to promote all of these profitable phases of the science

and practice of horticulture, and we have arranged with some of the men who have made the unusual but quite possible profits of \$500 to \$1000 and more per acre, to tell our readers how they have accomplished these interesting results, so that others may follow their example. This will be a prominent feature of THE GARDEN through 1886.

WOMEN IN HORTICULTURE.

There are many noble women in America who have bravely decided that the consumptive needle, the humiliating paint-brush, the low wash-tub, the leveling shop, the low-pay office work, and the school room are not the only means of livelihood for their sex; that the culture of flowers, fruits and vegetables is quite as appropriate for women as for men, and many of them have won great success in the industry. We shall give the experience of some of these women gardeners, and point the way for others to follow them.

BOYS AND GIRLS

Who are so inclined shall be led along in the pleasant paths of gardening, and taught how to make many a dime and dollar, and at the same time store up health and experience. Many a youth has made himself independent, and a blessed help to tired mother and toiling father, all by pleasant work in the garden. See our special offer to Boy and Girl gardeners.

NEW VARIETIES

Of fruits, flowers and vegetables, or "Novelties," will be duly chronicled each month, as begun in our last September issue.

THE MARKETS

Are the ultimate goal of the great majority of fruit growers and gardeners. We shall give a monthly review of the Metropolitan Markets, paying special attention to the uncommon fruits and vegetables, so that our readers may be able to judge somewhat of the advisability of their culture.

THE OLD FEATURES

That THE AMERICAN GARDEN readers know and like will be retained and improved upon so far as money and talent can improve them.

THE AMERICAN GARDEN has been and now is what may be briefly called a series of HOW PAPERS,

And described as follows:

- HOW—to Select Land,—to Choose what to Grow,—
- HOW—to Cultivate all Fruit, Flower and Garden Crops,—
- HOW—to Start and Run a Greenhouse,—to Begin with Fruits,—
- HOW—to Begin with Flowers,—to Plant a Lawn,—
- HOW—to Lay Out Grounds,—to Make the Homestead Beautiful,—
- HOW—to Run a Market Garden,—to Market the Products,—
- HOW—to Work a Kitchen Garden,—to Manage House Plants,—
- HOW—to Manage the Window Garden,—the Private Conservatory,—
- HOW—to Do Everything in Orchard, Vineyard, Garden, Conservatory, Lawn, Market Garden, etc.,—
- HOW—to Do Each Month in Fruit, Flower and Vegetable Culture, In-doors and Out-doors,—
- HOW—to find Large Profit, and Full Health and Gentle Pleasure in gardening.

OUR CONTRIBUTORS

Number many of the best, most successful, most practical, most progressive Fruit Growers, Florists, Gardeners, Landscape Gardeners and Investigators in All Sections of North America, in South America and in Europe. We enumerate some of them as follows:

SOME OF OUR CONTRIBUTORS:

A JOURNAL OF HORTICULTURE FOR ALL SECTIONS.

That THE AMERICAN GARDEN is essentially well adapted to the needs of nearly all sections of the country, and of interest and value to horticulturists of any country, the above prospectus and list of contributors proves beyond disussion. Prospectus continued on next page.

THE AMERICAN GARDEN.

PROSPECTUS FOR 1886.—CONTINUED.—

AN INCREASE IN SIZE

Of THE AMERICAN GARDEN to 32 pages, besides the cover, is made with this issue, which will be permanent. The increase in size will give room for the improvement of the old, and addition of the new, features above mentioned.

RISE IN PRICE TO \$2.00 A YEAR.

The increase in size and expensive improvements we are making in this magazine compel a corresponding increase in the subscription price from \$1.00 to \$2.00 a year, a step which we are sure many of our readers will endorse because it will bring greatly increased value in return. However,

THE PRICE TO JAN. 1 IS \$1.00,

And any of our present subscribers may now send in their subscriptions for 1, 2, 3 or 5 years in advance at \$1.00 a year, to continue on from the time that their present subscriptions expire, whether that is before or after Jan. 1.

TERMS FOR SUBSCRIPTIONS.

\$1.00 a year to Jan. 1, '86: 10 cts. a copy; 60 cts. for 6 months; 30 cts. for 3 months.

\$2.00 a year after Jan. 1, '86: 18 cts. a copy; \$1.00 for 6 months; 60 cts. for 3 months.

Subscriptions will be received before Jan. 1, for 1 to 5 years, at \$1.00 a year.

FOREIGN SUBSCRIBERS will add 24 cts. to the subscription price, for postage.

WOMEN, BOYS AND GIRLS.

SPECIAL REDUCTION IN PRICE TO THE YOUNG GARDENERS.

Any woman and any youth under 21 years of age who is actually engaged in gardening may receive THE AMERICAN GARDEN for one year at 25 per cent reduction from the regular price.

E. H. LIBBY, PUBLISHER,

GREENFIELD, MASS., No. 47 Dey St., NEW YORK, No. 94 Dearborn St., CHICAGO.

5 Union Square, NEW YORK, 104 State Street, CHICAGO, 1015 Penn. Ave., WASHINGTON, D. C.

CHARLES A. MAROT, 814 Chestnut Street, PHILADELPHIA.

CUPPLES, UPHAM & CO. 283 Washington Street, BOSTON.

TERMS TO CLUBS, TO JAN. 1, '86.

Five copies, 1 year - - - - - \$4.00.
Ten " " " - - - - - 7.50.
One copy, 1 year, to any person sending us 3 new subscriptions at \$1.00 each.

PREMIUM COMBINATIONS, SEE FOLLOWING PAGES.

ADVERTISEMENTS.

All advertisements are measured in agate type, that is, at the rate of 14 lines to the inch.

RATES.

25 cts. per line, each insertion; for orders aggregating 150 lines, 20 cts. per line; for orders aggregating 1,000 lines for consecutive insertions within one year, 15 cts. per line.

CIRCULATION 15,000,

wholly among gardeners, fruit growers, florists, nurserymen and amateurs interested in fruits, flowers and gardening.

You have only till Jan. 1st to Subscribe at \$1.00. After Jan. 1st the price will be \$2.00.

SAMPLES OF WHAT MANY THINK AND SAY.

I have carefully read your most valuable paper and consider it the best I have ever seen of its kind, and cheap enough without a premium.—John Jeannin, Jr., Rens. Co., N. Y.

It is the best horticultural journal published, and I wish you and it much prosperity.—G. Klarner, Quincy, Ill.

I find THE GARDEN growing in interest. That picture on the title page for June was fine. I see you take great pains in editing all the matter you present and I find it quite helpful. You are making a good magazine and you ought to be encouraged in your work.—W. H. Bull, Market Gardener, Hampden Co., Mass.

I would not be without THE AMERICAN GARDEN on any condition. A handsome paper certainly.—W. E. Abbs, Florist, Fon du Lac, Wis.

I have been a subscriber a number of years and enjoy its contents very much.—C. O. Giers, Providence, R. I.

It is of much more value to me than journals costing twice as much.—Horace G. Munson, Lincoln, Ind.

I consider THE AMERICAN GARDEN a thoroughly practical and useful journal.—E. M. Van Aken, Elmira, N. Y.

I have taken THE AMERICAN GARDEN for a number of years. It fills a place long needed in horticultural publications. I am very glad to see it improved.—Geo. J. Streater, Carrettsville, Ohio.

I would not exchange THE AMERICAN GARDEN for any other horticultural journal in the country, and you may rely on me to be one of your regular subscribers.—R. H. Arming, Hampden, Md.

The September number more than any previous one of my acquaintance, is artistic and practical, and although not the paper for the professional horticulturist or florist, yet a paper I suspect we cannot do without.—H. B. Orissey, Nurseryman & Florist, Fredonia, N. Y.

I could no more do without THE AMERICAN GARDEN than I could without a daily newspaper.—Mrs. E. H. Hesse, Utah.

THIS MAGAZINE IS SENT

this month to many people who were formerly subscribers, and to many who have seen only a few numbers. Please examine this copy carefully, and think twice before laying it aside.

You will be a welcome addition to our family of subscribers.

MEN AND WOMEN

BOYS AND GIRLS

Can make good pay by getting subscriptions for

THE AMERICAN GARDEN.

- Fruit Growers, Gardeners, Market Gardeners, Florists, Nurserymen, Amateurs, All Women who Love Flowers.

They all Want it, And Subscribe Quickly.

Everybody wants it who owns 2 or 200 fruit trees; or one plant or a conservatory; or a garden patch or large garden; or a doorway that needs improvement, or a fine lawn.

TO-DAY is The Time To BEGIN.

We pay liberally in cash if preferred, for all such services. See club rates above.

Our

THE AMERICAN GARDEN one year
 OUR COUNTRY HOME one year
 GOOD CHEER one year

Irresistible

for \$1.25

If ordered before
 JANUARY 1, next.

Offers.

A year's subscription to *Our Country Home*, or to *Good Cheer*, will be given to any one who sends in a new subscription to *The American Garden*, and the same to the new subscriber; Both of them to any one who sends in 2 new subscriptions to *The American Garden*, and the same to both of the new subscribers.

After Jan. 1 the subscription price of *The American Garden* will be \$2.00.

GOOD CHEER.

OUR COUNTRY HOME.

Good Cheer is one of the most popular home and family papers in the world. It is pure, clean, bright, wholesome, sparkling, helpful; full of good sense, good morals, good fun, good literature, good cheer, choice stories, anecdotes, poems, biography, history, useful information. Edited by Kate Upson Clark, assisted by a corps of literary talent equal to that of the great magazines: 20 to 24 pages, monthly: well printed on good paper. In a little over three years' time it has grown to 100,000 circulation. (Price 50 cents.)

Our Country Home, a monthly journal of agriculture and country life, is one of the greatest successes among all farm papers. Acknowledged to be one of the best, most reliable, best edited and brightest papers of its class. Edited by E. H. Libby, assisted by F. D. Curtis, E. S. Goff, F. D. Coburn, I. K. Felch, E. E. Rexford, and Mrs. Mary C. Hungerford, with numerous equally able contributors. Full departments on the Field, Garden, Dairy and Stock, Poultry, Swine, Law, and Home and Public affairs. (Price 50 cts.)

Sample copies of these two papers have been or will soon be sent to all our readers.

Separately the three periodicals cost \$2.00; together only \$1.25; after January 1, \$3.00.

OUR PREMIUM COMBINATIONS.

Books on Gardening.

Choice Special Periodicals.

A Few Choice Implements.

We have taken special pains in the selection of the following books and periodicals, etc., and, so far as we know, there has never been a more attractive series of combinations offered to people interested in Horticulture.

The form and method of the offers is, we think, ENTIRELY NEW. (a.) We quote a price for THE AMERICAN GARDEN together with the article mentioned, and (b.) we also offer each article as a premium for a club of subscribers.

It will be seen that the prices first named are in most cases the usual price of the premium alone.

(a.) (b.) WHO CAN GET THE PREMIUMS?—The offers (a) at the head of the paragraphs are for either old or new subscribers. The offers (b) at the foot of the paragraphs for one "new" subscription are only to those who are themselves subscribers; the clubs of two or more may include the sender's name.

You can send orders to our Nearest Office.

1.—(a.) For \$5.00, *The American Garden* 2 years (or 2 subscriptions) and *Downing's Fruits and Trees of America*; Or, the Culture, Propagation and Management in the Garden and Orchard of Fruit Trees generally. With descriptions of all the finest varieties of Fruits, native and foreign, cultivated in this country. By A. J. Downing. Second revision and corrected, with large additions. By Charles Downing. Over 1100 pages, with several hundred outline engravings, with latest Supplements. It contains the names and synonyms of over 10,000 varieties. 8vo cloth. (Price \$5.00.) Add 25 cts. for postage.

"As a work of reference it has no equal in this country, and deserves a place in the library of every pomologist in America."—*Marshall P. Wilder.*

(b.) Given as a premium for 10 subscriptions to *The American Garden* at \$1.00. Add 25 cts. for postage.

2.—(a.) For \$2.00, *The American Garden* 1 year, and *Downing's Selected Fruits*. Price \$1.50. This is abridged from *Downing's Fruits and Fruit Trees of America*. With some new varieties, including their Culture, Propagation and Management in the Garden and Orchard, with a guide to the selection of Fruits, with reference to the Time of Ripening. By Charles Downing. Illustrated with upwards of 400 outlines of Apples, Cherries, Grapes, Plums, Pears, &c. None but Choice and Tested Fruits are named, and with synonyms amount to over 2,500 varieties. 12mo cloth. Add 10 cents for postage.

(b.) Given as a premium, sent prepaid, for 3 subscriptions at \$1.00 each.

3.—(a.) For \$5.00, *The American Garden* 2 years (or 2 subscriptions), and *The Illustrated Dictionary of Gardening*. Vol. I. (Price \$5.00.) A Practical Encyclopedia of Horticulture, for Gardeners and Botanists. By G. Nicholson and able assistants. To be completed in three volumes. A Unique and Exhaustive Work, in which the practical information and Botanical classification have been brought down to present date. The number and beauty of its illustrations are without a parallel in any book on Gardening. Over 2,000 first-class Engravings will be given in the complete work. Vol. I, A to E, now ready. Cloth, 4to. 520 pages. Add 25 cents for postage.

(b.) Given as premium, one volume, for 10 subscriptions to *The American Garden* at \$1.00 each. Add 25 cts. for postage.

4.—(a.) For \$3.00, *The American Garden* 1 year, and *Barry's Fruit Garden*. (Price \$2.50.) Add 15 cts. for postage. A standard work on Fruits and Fruit Trees; the author having had over 30 years' practical experience at the head of one of the largest nurseries in this country. New Edition, revised up to date—Invaluable to all Fruit growers. By P. BARRY. Illustrated. Cloth, 12mo.

(b.) Given as a premium for 5 subscriptions to *The American Garden* at \$1.00 each. Add 15 cts. for postage.

5.—(a.) For \$2.00, *The American Garden* 1 year, and *Thomas' American Fruit Culturist*. (Price \$2.00.) New, Revised Edition, with practical directions for the Propagation and Culture of all Fruits adapted to the United States. By John J. Thomas. Illustrated with 519 Fine Wood Engravings. In one handsome 12mo volume of 593 pages, bound in extra Muslin. In the present (nineteenth) edition, a general revision of the work is made throughout, and among the added portions are descriptions of the newer Strawberries, Raspberries, Peaches and Grapes; lists of some of these fruits once famous, but now passing out of cultivation; directions for pruning orchards; construction of fruit houses and the best modes for storing fruits; new illustrations of budding and grafting; management of Orange groves in Florida; and a thorough revision of the Descriptive List and Index by the addition of new sorts. Add 15 cts. for postage.

(b.) Given as a premium for 3 subscriptions to *The American Garden* at \$1.00 each. Add 15 cts. for postage.

Continued on page 284.

(Continued from preceding page.)

6.—(a.) For \$2.50 *The American Garden* 1 year, and

Long's Ornamental Gardening for Americans. (Price \$2.00.) A Treatise on Beautifying Homes, Rural Districts and Cemeteries. A practical work at a moderate price, with numerous illustrations, and instructions so plain that they may be readily followed. By Elias A. Long, Landscape Architect. Illustrated, Cloth, 12mo. Add 15 cts. for postage.

(b.) Given as a premium for 4 subscriptions to *The American Garden* at \$1.00 each. Add 15 cts. for postage.

7.—(a.) For \$6.00, *The American Garden* 3 years (or 3 subscriptions), and

One Year's Sketch Book. By Irene E. Jerome. See specimen illustration on page 217 of this issue. An original series of illustrations, from nature, comprising forty-six full-page pictures (9½ x 14 inches) of great power and beauty, engraved in the best manner and at a great expence. The illustrations are full of life and color. Natural beauties are taken from all the year around. Scenes of Spring, Summer, Autumn, and Winter, in landscape and water sketches, by flashes of sunlight and straggling moonbeams, in every variety of shape, shade and color, mingle with gems of poetry applicable to the season. The volume is elegantly bound in black and gold. (Price \$6.00.) Sent by express.

(b.) Given as a premium for 10 subscriptions at \$1.00 each. Sent by express.

8.—(a.) For \$15.00, *The American Garden* 5 years (or 5 subscriptions), and

Orchids, The Royal Family of Plants. (Price \$15.00.) With illustrations by Harriet Stewart Miner, comprising twenty-four magnificent specimens in colors, each 10 x 14 inches, reproductions of some of the most celebrated and costly varieties of this peculiar branch of the floral kingdom. The collections from which these illustrations have been made are among the best in this country. The volume is 14 inches in length, 11 inches wide, 1½ inches in thickness; gilt edges, bevelled boards, and richly adorned in black and gold, making a beautiful book. Cloth, full gilt. Sent by express.

(b.) Given as a premium for 20 subscriptions at \$1.00 each. Sent by express.

9.—(a.) For \$2.00, *The American Garden* 1 year, and

Mushrooms of America, Edible and Poisonous. (Price \$2.00.) Carefully colored lithograph plates, showing 28 species of Edible and Poisonous Mushrooms, with full descriptions, and best manners of cooking the edible sorts in brief, concise form. By Julius A. Palmer, Jr., who for ten years has carefully studied Mushrooms with a view to their edible qualities. Published by L. Prang & Co., in the perfect manner this house is noted for. By its use one can readily learn to detect poisonous or edible Mushrooms. In the form of two charts, on heavy paper, for hanging on the wall; or the same in 12 colored plates and 4 plates of text, in strong portfolios.

(b.) Given for 3 subscriptions at \$1.00 each. Add 12 cts. for postage.

10.—(a.) For \$1.35, *The American Garden* 1 year, and

Webster's Practical Dictionary. (Price \$1.00.) A new departure in dictionaries. Undoubtedly the best cheap dictionary ever published.

See special advertisement of this offer on page III of cover.

(b.) Given as premium for 1 new subscription at \$1.00. Sent in by one already a subscriber. Add 10 cts. for postage.

SPECIAL CLUBBING COMBINATIONS WITH LEADING PERIODICALS.

11.—(a.) For \$5.00, (or more,) *The American Garden* 1 year, and

Any Periodicals Published in the U. S. to the amount of \$5.00 (or more) at the publishers' regular prices for single subscriptions.

(b.) \$5.00 worth of periodicals in U. S. given as premium for 12 subscriptions to *The American Garden* at \$1.00.

12.—(a.) For \$1.25, *The American Garden* 1 year, and

Good Cheer, the phenomenally successful literary paper for the family, and **Our Country Home**, a monthly journal of agriculture and country life. (Price 50 cts. each.)

(b.) Given as premium for 2 new subscriptions to *The American Garden* at \$1.00.

See full particulars on page 275.

13.—(a.) For \$2.75, *The American Garden* 1 year, and

Good Housekeeping (1 year). (Price \$2.50.) A semi-monthly journal "Conducted in the interest of the Higher Life of the Household." Conceived in a spirit of real love for the promotion of "the homes of the world," and executed by some of the wisest and brightest of practical men and women who have ever worked for this good cause. **Good Housekeeping** merits the warm reception and great success it is meeting with. Illustrated, and beautifully printed on fine paper. (Price \$2.50.)

(b.) Given as premium for 5 subscriptions to *The American Garden* at \$1.00 each.

14.—(a.) For \$1.20, *The American Garden* 1 year, and

Green's Fruit Grower (1 year), a quarterly journal of fruit culture. Bright, reliable, full of solid information and good sense, written in a style that it is a real delight to read; and the book, **How to Propagate and Grow Fruit**, by Chas. A. Green, well written and thoroughly reliable, covering all phases of the subject. (Price of paper and book 50 cts. each.)

(b.) Given as premium for 1 new subscription to *The American Garden* at \$1.00.

A FEW CHOICE IMPLEMENTS.

15.—(a.) For \$3.00, *The American Garden* 1 year, and

Little Detective Postal Scale. (Price \$3.00.) Weighs 14 oz. to 25 lbs. Hundreds of thousands sold. The best of all low-price scales; equal in value to any \$5 or \$10 scale we have seen. For House or Office it is equally efficient. One side of the beam shows the cost of postage in cents of any article weighed. Especially fine for seedsmen and

nurseymen. Sent by express.

(b.) Given as premium for 5 subscriptions to *The American Garden* at \$1.00 each.

16.—(a.) For \$18.00, *The American Garden* 5 years, and

Stevens' Hunter's Pet Rifle. (Price \$18.00.) Weight about 5 1/4 lbs.; length of barrel, 18 inches, good for 40 rods; 22 rim, 32, 38 or 44 calibre; rim or central fire; with combined sights. That it is made by J. Stevens & Co., is proof of its quality. A specialty, first made for a geological surveying party going to the Rocky Mountains, who wanted a gun to knock over a bear, which would be as light and portable as possible. Each gun thoroughly tested and remarkably accurate. With it you can knock over a woodchuck, or animal of similar size, 50 rods away, with great certainty, and some state that they do even better work at a quarter of a mile away. All of the "STEVENS" arms are made for every day folks, and at a price within the reach of all; require no fixings and no previous knowledge of arms; no special cartridges. Sent by express.

The publisher of this journal has always loved a gun and began to shoot at 10 years of age, though hard work and the business of life has kept him from this pleasure in late years. But he thinks that boys should be early taught the proper use of guns, and that only good guns should be put into the boy's hands. That is one motive for making this offer, and for selecting so good and low-priced a weapon as the "Stevens' Hunter's Pet."

(b.) The 18-inch "Pet" given as a premium for 30 subscriptions at \$1.00 each.

17.—(a.) For \$12.50, *The American Garden* 4 years, and

Stevens' Single Barrel Breech-Loading Shot-Gun. (Price \$12.50.) With forehand stock and Stevens' patent bolt; 12, 14 or 16 gauge; weight 6 to 7 lbs.; length of barrel 28 to 32 in.

[Testimonial:] 575 GREENWICH ST., N. Y.

My Single Barrel needs a new catch. I had it this summer down in Virginia, and used it in preference to my double gun, and I don't want anything better as to shooting qualities. It has been shot in the past two years over 2000 times, and has required no repairs since I bought it.

Sent by Express.

ROBT. GORDON.

(b.) Given as premium for 20 subscriptions to *The American Garden* at \$1.00 each.

18.—(a.) For \$1.75, *The American Garden* 1 year, and

Maher's Common Sense Knife. (Price \$1.00.) A Jack Knife, a Pruning Knife, a Budding Knife, all in one. No knife ever met the wants of so many people as this has done; there are thousands in use by fruit growers and nurserymen, from Maine to Texas and in

orange groves of Florida and California. Sent postpaid.

(b.) Given as premium for 2 subscriptions at \$1.00 each.

19.—(a.) For \$1.40, *The American Garden* 1 year, and

Ladies' Pearl Handle Pen Knife. (Price 60 cts.) A beautiful knife, 2 blades of the best quality. Size of owl. Made by Maher & Grosh, which is sufficient guarantee of quality. Sent postpaid.

(b.) Given as premium for 1 new subscription at \$1.00.

20.—(a.) For \$1.50, *The American Garden* 1 year, and

Six Books, in paper covers. These are valuable little manuals, viz., No. 1. *Flowers in Winter*, all about house culture of plants; No. 2. *The Flower Garden I*, how to grow plants out-doors; No. 3. *The Flower Garden II*, hardy shrubs and ornamental plants; No. 4. *The Vegetable Garden*, a handy guide to the kitchen garden; No. 5. *Insect's Fruits*, the culture of small fruits for family use; No. 6. *The A. Z. Poultry Book*, poultry keeping for profit.

(b.) The 6 books given for 2 subscriptions to *The American Garden* at \$1.00.

DECEMBER PLEASURES.

IN TIME TO COME.

The flowers are dead that made a summer splendor

By wayside nooks and on the sunny hill,
And with regrets these hearts of ours grow tender,
As sometimes all hearts will.

We loved the blossoms, for they helped to brighten

The lives so dark with wearying toil and care,
As hopes and dreams forever help to lighten
The heavy loads we bear.

How like the flowers, whose transient life is ended,

The hopes and dreams are, that for one brief hour

Make the glad heart a garden bright and splendid

Above Love's latticed bower.

One little hour of almost perfect pleasure,

A foretaste of the happiness to come;
Then sudden frosts—the garden yields its treasure,
And stands in sorrow, dumb.

Oh, listen, heart! The flower may lose its glory
Beneath the touch of frost, but does not die—
In spring it will repeat the old, sweet story
Of God's dear by-and-by.

In Heaven, if never here, the hopes we cherish—
The flowers of human lives we count as lost—
Will live again. Such beauty cannot perish;
And Heaven has no frost.

TOMATO GROWING IN ENGLAND.

When in England last summer no industry in horticulture surprised me so much as the growing of Tomatoes in greenhouses. One establishment at Swanley, Kent, covered an area of something over five acres. In running feet the greenhouses were two-and-a-half miles in length by 18 feet in width. Such an establishment must have cost, even in England, not less than \$100,000. All this space when I saw it last August was platted with Tomatoes, which were then selling at six pence sterling per lb., or about \$6.00 per bushel. At much less they would not pay to raise under glass.

The wonder is that in these days of refrigerators on our ocean steamers, some enterprising firm on this side of the Atlantic does not go into the business of supplying England with Tomatoes. They can be grown here, and even selected for exportation at \$1.00 per bushel. The transit and use of refrigerators would not be much more, I should judge, and the quality of our fruit grown in our tropical summer is much better than that grown under glass in the cloudy atmosphere of Britain.

The proprietor of this vast establishment alluded to at Swanley, is Mr. Ladd, a man hardly yet beyond middle age. He operates three separate greenhouse establishments in different parts of the suburbs of London, aggregating in extent nearly 20 acres of glass. One division is devoted to hothouse Grapes, another to Tomatoes, and another to Roses and other bedding plants; and when it is known that all these vast establishments are owned and controlled by Mr. Ladd, who less than twenty-five years ago was so poor that he had to carry his plants in a basket on his head to Covent Garden Market, it will give some idea of the enterprise and ability that one man in a short lifetime has thrown into horticulture. In extent his establishment far surpasses all his contemporaries; and some of the older ones are the accumulations of two or three generations.

I noticed that in the hundreds of conservatories attached to private dwellings, Tomatoes during the summer months were trained up on the rafters under the glass, showing the great increase evident in the consumption of this vegetable. Over a dozen years ago I do not remember of finding them cultivated for market anywhere in England, nor of even seeing them grown for private use in greenhouses. If they can be cheapened by export undoubtedly the consumption of them would be much larger, and somebody may yet make a fortune in exporting Tomatoes. PETER HENDERSON.

MIGRATION OF FRUITS.

As fruit growing is more and more becoming one of the great industries of our country, the history of the migratory course taken by the various kinds of fruits furnishes a most interesting study.

There was a time when New York's Strawberry supply was obtained almost exclusively from Bergen Co., N. J. Many readers will remember how abundant and cheap these berries were, yet, as a market crop, Strawberries are now hardly to be found anywhere in the county; they have migrated to Monmouth and Burlington counties of the same State, where hundreds of acres are under cultivation; then they moved on to Delaware, Maryland and Virginia, while others took a northerly course toward Connecticut and Western New York.

In the Blackberry we find the same roving habits. Formerly all the Blackberries that came to our city were wild ones, gathered on the uncultivated lands of Long Island and New Jersey, but when the demand increased more than the supply, some enterprising fruit growers undertook to civilize them, and make them yield to the influences of the plow and hoe; and remarkably well they did succeed. The Kittatinny, the Wilson, and other varieties were christened and sent out to gladden the hearts and palates of all lovers of this delicious fruit. Soon they wandered all over New Jersey, into Delaware, and Ulster Co., N. Y., but they did not remain long except in Monmouth, Burlington and Cumberland counties, N. J., where they found a congenial home and are still cultivated successfully and profitably.

Peaches are not found more stationary. In 1848 to 1850 Burlington Co., N. J., was literally filled with Peach trees loaded with delicious fruit. So abundant were the crops that frequently the Peaches sold for less than the cost of transportation. Now, I doubt whether enough Peaches are grown in the county to supply the home demand. What became of them? Some have become domesticated in adjoining counties where they are giving rich returns, others went to Delaware and Maryland, and others, quite lately, to Ulster Co., N. Y. In these latter localities cultivators have become so much pleased with them, that they make Peaches their leading crop, and yet the probability is that it will not require a life time before they will have deserted their present homes. In fact, in Delaware their decadence has already commenced; hundreds of orchards are perishing for every dozen that are planted.

It is only a few years since our principal supply of Grapes came from Nyack on the Hudson; now this town receives the quantity

needed for home use from New York. The cultivation of the Grape has spread over a large area in Northern as well as Southern States. For a time Grapes settled in Virginia, Delaware, the lower counties of New Jersey, but notwithstanding the great care taken with them they did not become firmly enough established. The choicer varieties at least did not seem inclined to associate with the Concord, and sought and found congenial homes around the beautiful and romantic lakes of Central New York. Here the Delaware, Diana and Catawba flourish as they do nowhere else. The Concord has settled along the banks of the Hudson, chiefly in Ulster Co., where both soil and climate are remarkably favorable, and cultivators understand their special management to perfection. Anyone who desires to see Concord in greatest excellence should visit Marlboro' and the Highlands of the Hudson.

Early geographies have told us that New Jersey is noted for its fine Apples and sweet cider. Then every farmer that could raise Roman Stems, Belle Flowers and Wine Saps was sure of realizing large profits; and a tree loaded with the delicious Sheep's Nose was considered one of the greatest luxuries of the farm. Some may also remember with delight the days when they rolled the barrels of sweet cider into the cellar, in anticipation of the winter evening's enjoyments around the open fire-place, cracking nuts as well as jokes, and passing round the cider jug. But, alas, in modern geographies no mention is made of these facts; because in New Jersey the glory of the Apple has departed! C. W. IDELL.

Water-Lilies will hereafter form a conspicuous feature in the Central Park of New York, the Park Board having voted \$1000 to be used for the purchase and planting of the choicest kinds.

Field flowers, Fuchsias, the blossoms of meadow plants, with fantastic grasses from Jersey marshes, have been used effectively the past summer in decorations, both for out-of-doors, and home decorations. Iris has been very popular, as have been Hibiscus and Abutilon.

A double Gladiolus flower is reported by one of our readers. Some years ago we observed such a freak of nature in our own garden, but did not consider it an improvement over the single form. The corn that produced it was planted the following year, but all its flowers were single.

For a garden party given on Staten Island, arches were made in the grounds, of wild grasses, over which were draped the yellow Lilies of the swamp which swung their amber bells about in a very æsthetic way. Large and carelessly tied sheaves of Reeds and Cat-tails were placed in bronze vases, and hoisted artistically on the statuary in the grounds. In the house there were large, oval baskets and ornamental camp kettles filled with native Ferns, wild Roses, and *Lobelia cardinalis*.

Most of the plants grown ordinarily in windows, such as Geraniums, Carnations, Stevias, Abutilons, Fuchsias, etc., like plenty of direct sun, but not a high temperature.

DELLWOOD.

THE RESIDENCE OF MR. T. J. SLAUGHTER. Dellwood lies on a high tract 450 feet above the level of the sea. The estate embracing 70 acres with all the beauties belonging to hilly localities,—the knolls, slopes, and dells that give such charming expression and provide the landscape gardener with facilities for working out elegant effects. A wide spread of lawn covering 20 acres, and a dense forest of Oak, Chestnut and Norway Pine in the distance, are striking features as Dellwood is approached. Such a stretch of turf, so neatly shaven that it appears like moss, with its shadows of the specimen evergreens that are planted in

each side of the entrance to the porch are very remarkable specimens of Magnolias. These trees are of perfect symmetry, and in May when they are covered with a shock of blossoms, they present a grand appearance and their fragrance spreads a wide distance. The borders in front of the house have been through the summer ornamented with oval beds of bright foliage. At one side there was a parterre of the best varieties of Japanese Lilies; Tigridias and Gladioluses were massed together, and seemed to vie with each other for supremacy. The many tall blossoms of rich hues, and the numerous Lily-heads half bowed in their own peculiarly graceful fashion, formed one of the origi-

view of the *Hydrangea* beds from either side of this winding road is delightful. All of the finest varieties are set out for summer ornamentation. At the head of the entrance to the "Dells," a large bed of gorgeous flowers has been cultivated carefully, and has spangled the turf with its kaleidoscopic colors. *Althea* shrubs make a stalwart background, and Geraniums of great size have given out a blaze of bloom. Sunflowers, Marigolds, *Calendula* *meteor* and *Salvia* provided a radiance that was magnificently conspicuous until frost broke down their glory. Masses of *Begonia* have also, with their pendulous blossoms, that looked as if dusted with diamonds, beau-

THE COUNTRY PLACE OF T. J. SLAUGHTER, ESQ., AT MADISON, N. J.

clumps at intervals, satisfies the eye with its lovely serenity, from April to November. The aim in embellishing the front grounds has been to give them an elegant simplicity. During the summer six specimen plants of *Allamanda Schottii* of great size were placed along the drive toward the homestead. These plants were laden with a mass of golden blossoms, and the rich, funnel-shaped flowers never showed their yellow throats to better advantage than here, contrasting vividly with the lawn and its dark dots of trees. A most graceful Palm, *Seaforthia elegans*, with its dark-green, smooth leaves, five feet in length, bending fantastically, occupied a prominent position near the veranda. At

nal designs of path decoration at Dellwood. A path leading down the front lawn to a picturesque lake is lined with handsome shrubs on either side that make an agreeable break. This path meets at the water edge a summer-house, wreathed with Honey-suckle and Roses in their season; the lake is fringed with Willows, which droop their branches into the cool spring water, when these are dressed with green. The avenues inside of the grounds are 20 feet wide and are flanked by ancient Elms of noble grace. There is a circular drive in the border of the "Dells," (which are five in number,) that is admired by the numerous visitors to these pleasure grounds. The

tified this position, in the perfection of art. The curious formation of land in the "Dells" lends interest and charm to this part of the estate. The "dells" are like deep bowls sunk below the surface. Four of these are kept mown as carefully as the level lawns. In one a tropical effect in growth is cultivated at the suitable season; in another are dwarf evergreens, and in still another are clusters of forest trees. A Fern dell is by far the most fascinating. It is one tangle of wood Ferns, containing almost every kind hardy in the climate. A fine effect was made in one dell where the grass was like plush, by a central bed of *Hydrangea Hoggii*, that blossomed profusely.

Fruits.

SEASONABLE HINTS.

Usually a good deal of work may be done this month that will forward and facilitate spring operations. Plowing the ground where new plantations are to be made, digging holes for trees to be planted, constructing trellises, procuring posts and stakes, and many other things may be done now to material advantage.

All plants that require winter protection should be covered without delay.

Strawberries in the Northern States are always benefited by winter mulching, and on heavy, retentive soils it becomes an absolute necessity if we would insure best results. For ordinary-sized beds in the home garden, an excellent way of winter covering is to spread coarse manure between the rows, then cover the entire bed, plants and all, with dry leaves, about two inches thick, and lay evergreen branches or brush over them sufficient to keep the leaves in their place.

In the field coarse straw is generally more convenient of application, with here and there a shovelful of soil thrown upon it to hold it down. Where salt hay can be obtained, nothing is better for the purpose; it is free from obnoxious seeds, and may be used for many years.

Raspberries.—Now is an opportune season for scattering coarse manure along both sides of the rows. It is astonishing what effect such a top-dressing has on the following year's crop.

Grapevines of tender varieties should be loosened from their trellises, bent over, laid upon the ground and be covered with soil, principally their tip ends, the chief object being to prevent evaporation from the terminal twigs. The vines may be pruned before laying them down, thus lessening the work of covering. Even simply laying the vines upon the ground makes them less liable to suffer than when left on the trellises.

Mice are often doing considerable damage to young fruit trees during winter, especially when there is much snow upon the ground and these mischievous rodents cannot find much food. They will then work under the snow towards the trees, and gnaw their bark off. Tramping the snow down after every snow-fall, several feet around the stem of the trees, is an almost complete protection; but as this is apt to be neglected sometimes, a surer preventive is to hill or bank soil around the trees. These mounds should be not less than 18 inches high, as steep as possible, and be packed firmly and smoothly. Of course this has to be done before the ground freezes very deep.

Coal Ashes.—Don't cart coal-ashes in the road if your land is heavy, but sift and scatter them over the ground. Spread thickly around Currant and Gooseberry bushes; ashes are one of the best non-conductors of heat, and keep the soil around the plants cool and moist in summer. In many a garden a load of sifted coal-ashes will do more good than a load of stable manure.

Labels will get lost even in the best regulated gardens, therefore no prudent gardener should consider his year's work finished before he has drawn a map of his grounds on which the position and name of every tree is marked.

THE GREGG RASPBERRY IN VERMONT.

If called upon to select one variety of each class of fruits or vegetables and we were restricted to the cultivation of that particular kind, the choice would in many cases be a very difficult and puzzling matter, but were I placed in this improbable predicament, when it came to Black-cap Raspberries, I am sure that I should without hesitation speak for the Gregg. Although a trifle late in ripening, the general sterling qualities of the fruit will amply repay one for waiting a little. In my test of this variety it was planted in a strong, sandy loam, near to, and was given the same care as, the Souhegan, Tyler, and Mammoth Cluster. The Gregg has outstripped all the others in vigor of growth, and as to productiveness was far ahead. The size of the berry averages larger than any other cap variety of my acquaintance, and the quality is excellent.

My experience with plant novelties leads me usually to modify somewhat the statements of originators and disseminators regarding their new varieties when taken as a base for expectations, but I confess that the claims for this variety have been fully substantiated thus far in my experience with it.

The Souhegan was a disappointment both in earliness and other qualities. My plants obtained from two reliable sources gave no better results than the Tyler which they closely resemble. The old Mammoth Cluster has many friends yet, and not without good reason, for when given a fair chance on strong, moist soil, it will compare favorably with many of the new arrivals.

Vermont.

W. H. RAND.

BEES ARE POMOLOGISTS.

Not a few believe that bees injure fruit. They are frequently accused of injuring Peaches, Apples, berries, and even Grapes. I do not believe this. But though it be correct the bees are the best friends of the horticulturist. Did you ever think why? Sex is not confined to the animal kingdom by any means; plants are sexual. The sexual organs are in the blossoms. For the blossoms to produce fruit the ovules must be fertilized by the pollen from the anthers at the summit of the stamens, which falls upon the stigma and traversing the style of the pistil reaches the ovary.

In this process of fertilizing, insects are important aids and in quite a large number of cases are essential aids; and of all insects bees are the most important workers. They seek the honey to be found in the blossoms; and while on this quest they disturb the anthers, knocking the pollen upon their wings and bodies and in this way conveying it to waiting stigmas. In a large class of flowers the work of insects is essential to fertilization either because the stamens and pistils of the blossom do not reach maturity at the same time, or the pistils are turned away from the stamens, preventing the pollen from falling on the stigmas, or else the anthers are below the stigmas, having the same effect; while other blossoms have no pistils or else no stamens; in all these cases self-fertilization is impossible.

To fertilize such blossoms it would seem that the creation of the bees had been especially designed, so well do they perform their work. First, the bees are formed just

right to accomplish it. Then the flower has the honey to attract the bee. And when the conditions are most favorable the flower sends out a fragrance to yet further attract the bee. Prof. Gray calls this fragrance the flower's advertisement. But it may occur to the mind of the reader that the bee would visit flowers of different species and thus occasion the greatest confusion. Not so. The bee has a keen sense of taste and never mixes its nectars, but as the nectar of all blossoms of each species tastes alike it confines each visit to one species. Aside from this, having found nectar in one blossom it would naturally seek in others having the same appearance and fragrance. To get at the honey the bee must twist itself into all possible shapes and positions, a wise provision of nature to secure the dislodgement of the pollen; and she also doles out the nectar in small quantities that the bee may be compelled to make frequent visits. It is also a fact worthy of note that the blossom does not yield nectar until it is ready for its part in fertilization.

This phase of the phenomena is curious enough to be interesting, but there is an intensely practical aspect of the case. Nature would not go to so much trouble for nothing, and if there was not an important work for the bees to perform, there would not be these provisions made for it. We are forced to the conclusion that where there are no bees many blossoms will fail of being properly fertilized and hence fail to mature fruit.

How much the fruit grower would lose by the total destruction of bees it would be hard to estimate even approximately, but probably it would far exceed any damage the bees will do by occasionally puncturing a Grape or Peach. It is said that in a town in Massachusetts, so strong was the belief that bees injured the fruit, that an ordinance was passed obliging the bee-keepers to remove their bees to another locality. After a year or two the fruit growers decided to have the bees brought back as so little fruit set upon the trees in proportion to the blossoms which appeared. When we consider the work done by bees, we are justified in calling them pomologists.

I am certain that bees injure fruit very little, if at all. Most of the destruction blamed upon them is the work of other agents. The jaws of the bee are too weak to puncture the skin of the most delicate Grape. Only after it is pierced does the bee harm the fruit.

JOHN M. STAHL.

PARTIALITY OF ROSE-BUGS.

In the "Munson Hill Nurseries," in my vicinity, are growing a number of Japan Persimmon seedlings, some of which fruited this year. On one tree, which bloomed profusely, the blossoms were small save on one branch which had large ones. The rose-bugs attacked the small blossoms, and although frequently picked off by hand, a hundred and more at a time, the blossoms were destroyed, while the large ones on the same tree were not disturbed by them and perfected fruit.

My attention was not called to it in time to note whether the small blossoms were strictly staminate or not, but I will carefully examine them next season and report.

Virginia.

C. A. UNDER.

SOME GOOD TABLE APPLES.

A succession of handsome, showy Apples of first quality is a want often felt, not only by city eaters but by country residents when wishing to replenish the fruit dish. Apples placed upon the tables of first-class hotels, what might be an ornament and attraction to the tables being a positive disgrace are not wanting, and whoever will grow them and bring them to market in as good condition as California fruit is received will be apt to find ready customers in every large town and city.

To one wishing to grow a succession of table Apples combining beauty with good quality, the following list will prove satisfactory where but half a dozen trees can be grown: Early Harvest, Chenango Strawberry, Maiden's Blush, Belmont, Canada Red, Golden Russet. All in the front rank.

Early Harvest ripens in August, is of a beautiful lemon yellow color, and is the only really good table Apple of its season.

Chenango Strawberry when well grown is, I think, the most desirable of all Apples. It is of good size, sheep-nosed or truncated conical in shape, color bright red overlaid with dark red, and as good as it is handsome. It has a meaty texture and aromatic, pleasant flavor that no other Apple possesses. The tree is a healthy, rapid grower of medium size. Its season in Northern Ohio is September 1st.

Maiden's Blush with its pale yellow dress and bright red cheek follows close upon the heels of the Chenango and lasts until the first Belmonts tempt the Apple lovers' taste.

Belmont, also known as Gate, Mamma Bean, and Waxen, is a most beautiful Apple, large, smooth, waxen yellow, often faintly blushed orange and spotted red; flesh yellow, tender, with a rich sub-acid, fine flavor; a profuse bearer. Its season is from October to January, when it is succeeded by the not uncommon

Red Canada, otherwise known as the Richfield Nonsuch. This is a good-sized, dark red Apple, of fine appearance and very excellent flavor. It does not wither, and holds its flavor until the very last Apple has succumbed to the inevitable, about March 4th. After this there is no Apple that, all things considered, is so good as the

Golden Russet. As ordinarily kept, subject to both heat and light, it withers and loses flavor, but when stored close, dark and moist at a low temperature it is of better quality for the table, taking texture into account, than the Newtown Pippin or Roxbury count, the only two Apples of the older varieties that rival it in keeping qualities.

If additional varieties are wanted to overlap or reinforce those mentioned I would choose, *Tetofsky* (neither handsome nor extra good but very early, and better than none), *Porter*, *Ohio Nonpareil*, *Fameuse*, (Snow) *Jonathan* and *Pack's Pleasant*.

Of newer Apples both handsome and good may be mentioned *Oldenburg* and *Wealthy*; the latter a brilliant, light red, medium to large-sized Apple with a pleasant, sub-acid flavor, originated in Minnesota, and, on account of its "iron-clad" hardiness, is of inestimable value for extreme Northern and Northwestern States.

Astrachan, *Alexander*, *Western Beauty*, *St. Lawrence* and *Rome Beauty* are all very showy and beautiful, but deficient in flavor.

L. B. PIERCE.

OLD AND NEW GRAPES.

At a recent meeting of the American Institute Farmers' Club Mr. E. Williams of

quality, while it is fully as hardy, vigorous, healthy and productive. It is usually a week earlier than Concord; this season there was little difference. It has been repeatedly asserted that it was so nearly like the Concord that it made little difference which was planted, and doubtless thousands of Concord had been sent out and planted under this name. He had insisted for years past there was a decided difference and people were finding it out.

Concord.—Too well known to need comment for our readers.

Early Victor.—An early Grape, raised and sent out by John Burr of Kansas, the originator of Burr's New Pine Strawberry of years ago. This Grape is about as early as any of the preceding. The vines received were poor, but having become established seem thus far to be hardy, healthy, vigorous and very productive. The cluster and berries are rather under size to meet the popular demand; a very good early Grape for his section.

Cambridge.—Another seedling of Concord and much like it in every respect.

Black Hawk.—Another of the family, hardy and vigorous. Cluster and berry a little smaller than Cottage and ripens about the same time; quality nearly up to the average of this family.

Martha.—A white Concord seedling, vines a little less vigorous than its parent, berry and cluster medium, productive and liable to rot and mildew, berry sweet but lacking in character. When it was introduced the advertisement said everybody wanted Martha, but on trial it is found that everybody doesn't want her, they prefer a lady of more decided character. It is prone to decay soon after reaching maturity.

Telegraph.—An early Grape of good quality; cluster medium size, close

and compact; vine hardy, healthy and productive, as nearly iron-clad as any he has. A Grape that has been very much overlooked.

Jess' Seedling.—Another iron-clad vine, cluster large and abundant, colors early, and when ripe in appearance is sour and austere. In this condition it is sent to market in large quantities under the delusive idea that earliness and good looks will secure the highest prices, but one purchase satisfies the customer, and the demand and price go down together. If growers would learn and practice a little honesty and common sense in this respect, they would find it more profitable to themselves and their neighbors. It is a great deal easier to lower prices than to raise them, and it is suicidal policy to send unripe fruit of any kind to market under the delusive idea that the purchasing public doesn't know the difference. It does not take them long to learn the difference, and to let

THE WEALTHY APPLE.

Montclair, N. J., one of the most public-spirited members of the Club, exhibited an excellent and highly interesting collection of Grapes. The following comments upon the different varieties, as derived from his personal experience with them, are of great interest and value to Grape growers, and were kindly furnished by Mr. Williams for publication in THE AMERICAN GARDEN.

Cottage.—A Seedling of Concord, as healthy, hardy, vigorous and productive as its parent. Clusters not quite as large, berry fully so, earlier and better, very sweet and delicious. When fully ripe, drops rather freely.

Moore's Early.—Another Concord seedling of the same general characteristics; very large and about ten days earlier; cluster more compact, and seems to improve in size as the vines grow older.

Worden.—Still another seedling of Concord, earlier, larger, and much superior in

it alone. This Grape should hang two or three weeks after appearing to be ripe to attain its highest degree of excellence. It is then a very good Grape.

Isabella.—An old favorite, that has of late years become so fickle that she cannot be depended on to ripen, and if perchance she reaches the condition, does not seem to acquire that degree of perfection in quality for which she was noted thirty to forty years ago. Why? is a conundrum he confesses his inability to solve.

Catawba.—Another old friend and for many years the favorite consort of the *Isabella*, has followed in her footsteps and become so capricious as to be very uncertain. He still retains a vine or two for "Auld Lang Syne."

Clinton.—This variety was widely disseminated when the *Isabella* and *Catawba* began to fail, but as a table Grape it failed to meet with general favor, but for some purposes it is still retained and has been quite extensively planted.

Bacchus.—A Grape of like character as the *Clinton* and so nearly like it in all characteristics of fruit and vine as hardly to be distinguishable save by an expert. It is said, however, to possess better wine properties. Both are vigorous, hardy and productive.

Canada.—This is one of Arnold's hybrids, said to be a cross of *Clinton* with *Black St. Peter*. Vine a moderate grower, berry larger than *Clinton*, cluster resembling it somewhat but not shouldered; decidedly the best Grape of this family he has yet tested. It has a sprightly, vinous flavor and ought to make a better wine than the *Clinton*.

Black Eagle.—A hybrid Grape raised by Dr. Underhill, a fine Grape in perfection, but the vine is not very vigorous and the fruit is liable to set imperfectly and rot badly.

Black Defiance is another of Dr. Underhill's hybrids, a late Grape of fine quality and splendid appearance. It ought to be a splendid Grape farther South where the seasons are longer; cluster very long, berry large, quality very good.

Lady Washington.—One of the most showy of all our white Grapes; vine vigorous and healthy, berry medium, cluster very large, quality variable, sometimes very good, at others very inferior. In appearance, well-grown clusters are without a peer.

Pocklington.—This Concord seedling of which such extravagant claims were made has not thus far come up to the standard claimed for it. The clusters are small to medium and the foliage has mildewed and the fruit rotted every year. When fully ripe, very handsome golden yellow and drops freely. Older vines and higher culture may improve its cluster if nothing more. The native aroma in the first is very abundant.

Delaware.—A fine, delicate Grape, by some considered the finest of all our native varieties, among Grapes what the *Seckel* is among Pears. Vine a very moderate grower generally, and when first introduced many vines were propagated from green wood to such an extent as to ruin its constitution; of late years it seems to be recovering in this respect, so that vines planted in congenial soil and liberally treated, give good results when well established.

Vergennes.—A red Grape that was claimed to be the Grape "par excellence" we had been

looking for, as it was going to keep better than any other, but somehow his vines had mildewed so badly for three years past he had not been able to ripen a decent crop of fruit; berry large, cluster medium.

Elvira.—A white Grape from Missouri said to be valuable for wine. Vine a vigorous grower and enormously productive, five and six clusters on a cane being common. Cluster short, often shouldered; very compact, so much so as often to crowd the berries off the peduncles. It often cracks badly on approaching maturity, especially in rainy weather; of no value as a table Grape.

Noah.—An Illinois seedling of Saylor, the same as *Elvira* but a great improvement over that variety in size and beauty of cluster; vine a strong, vigorous grower but very liable to mildew, and on reaching maturity the fruit drops as badly as any kind he knows of. It is a pity so handsome a Grape should be of so poor quality for table use. As a wine Grape it may be all that is claimed for it.

Goethe, Rogers' No. 1.—A Grape of excellent quality, berry large, bunch medium; it is often called a white Grape but when fully matured becomes of a delicate pink. Like all of these hybrids the foliage and fruit are liable to mildew, but its delicious quality will justify the risk and extra care in this direction to secure it.

Salem.—One of the most popular of Rogers' red varieties, cluster medium, berries large, quality excellent, vine vigorous and productive, sometimes rots badly.

Wilder, Rogers' No. 4.—One of the best and most popular and reliable of his black varieties; berries and clusters large, quality excellent.

Merrimack, Rogers' No. 19.—Black, quality good, cluster medium, often fails to set well.

Barry, Rogers' No. 43.—Black, berry large, cluster medium to large, vine vigorous and productive, quality very good and keeps well.

Herbert, Rogers' No. 44.—Clusters medium to large, seldom shouldered, berry very large, black, excellent vine, vigorous and productive. This with *Barry* and *Wilder* are the best of Rogers' black varieties he has tested.

Massasoit, Rogers' No. 3.—An excellent and beautiful red Grape, early, berry and cluster large, vine vigorous and productive. The chief fault is its tendency to set its fruit imperfectly, otherwise it would be one of the best early varieties.

Agawan, Rogers' No. 15.—A very popular red Grape, early, of large size, thick skin with a peculiar musky, aromatic flavor, cluster large but often imperfect. This is by some considered the best of all of these hybrids.

Jefferson.—A late red Grape of excellent quality, vine a moderate grower, and with him has seemed a little tender, especially the last severe winter; the buds started feebly in the spring and the clusters were small.

Missouri Nesting.—A wine Grape from Missouri; vine appears to be hardy and healthy so far; fruiting this season for the first time.

Beauty is also a Missouri seedling and seems appropriately named; vine so far vigorous with a remarkable healthy foliage; the fruit promises well us to quality and

beauty; this being its first fruit we may reasonably look for improvement in size of both berry and cluster as the vines get more age. *Highland, Ricketts*.—A large, handsome berry and cluster, but late and needs to hang a long while after coloring to reach perfection. He fears it will prove too late to ripen satisfactorily in this vicinity.

Empire State, Ricketts.—A new white Grape of superior quality and very promising. Though not so large in berry and cluster as some, it promises to make up for these deficiencies in quality. The vine is a vigorous grower and quite healthy.

Brighton.—An early red Grape of excellent quality, vine vigorous and productive, berry of good size, clusters large and handsome, one of the very best in all respects.

Niagara.—For vigor, productiveness, size and beauty of berry and cluster this has so far proved the "Ne plus ultra" of all white Grapes yet tested. The quality is good, not of the best, but it suits most peoples' tastes so far as his observation goes.

The late Charles Downing pronounced some fruit sent him last fall as better than *Concord*. High authority! The cupidity and haste to make money on the part of some growers has kept the market supplied with unripe fruit all the season, which has injured the reputation of the fruit, as well as their own, and the persistent assertion of some parties that it is ripe when it is not, tends in the same direction. A little more honesty and self-respect in these regards would be of benefit to all concerned, and to none more than those whose greed for gain prompts them to spoil the market for themselves as well as others.

Pearl and Green's Golden are new white varieties fruiting for the first time, and it would be premature to express an opinion of their merits further than to say that thus far the vines remained healthy.

Out of all the varieties he has thoroughly tested, he could not name three kinds—one of each color—possessing so many good qualities, such as vigor, health, productiveness, size and beauty of berry and cluster, quality, for his section, as the

WORDEN, BRIGHTON AND NIAGARA.

In this he knew many would disagree with him, but with present experience that is his choice, and although frankly admitting that there are many kinds of better quality, taking the average of all the merits combined of the three varieties named, they stood higher than any he was acquainted with.

He did not wish to be understood as considering the market properties of the different kinds. The markets were overstocked because the consumption was not equal to the supply. It was the home supply and home consumption he would encourage. Every man or woman who owned a lot outside of a cemetery, should grow enough Grapes for their own family use, and till they did they would not know the luxury of the delicious fruit fresh from the vines, a luxury they never would know if they depended on buying their supply in market.

The great difficulty he has to contend with in Grape growing is mildew and rot. Nearly all varieties are subject to these cursed afflictions. When we learn how to successfully prevent or cope with these troubles Grape growing would lose half its terrors.

THE INFLUENCE OF POLLEN ON THE FRUIT.

BY A. S. FULLER.

Since making my first experiments for the purpose of determining the influence of the pollen on the Strawberry, I have observed many instances of changes in the color, form and flavor of other kinds of fruits as well, which, as it appeared to me, were directly traceable to the influence of pollen, although it must be admitted that with our improved cultivated fruit we must expect an occasional reappearance of ancestral characteristics which may mislead us in attributing certain results to a fictitious cause. Still, when a branch of an Apple tree generally producing fruit with a smooth skin bears russet Apples, and we can find no other cause for the change but the close proximity of a tree bearing Russets, we are inclined to believe that pollen has had something to do in producing the change observed. Because similar or like results are not produced every year only indicates that self-fertilization is the rule with the flowers of such fruits as the Apple, and it is only when the pollen of a particular branch or whole tree is less potent than that on a neighboring one that cross-fertilizing occurs.

I doubt not that every observing practical member of the American Pomological Society can call to mind many such instances of cross-fertilization among our larger cultivated fruits as well as among garden vegetables, especially with Melons and Squashes, for with the latter the influence of the pollen is more readily seen to extend beyond the seed than with such small fruits as the Strawberry.

That our vegetable physiologists have given us very little information on this subject is not at all strange, for very few of them have ever had their attention drawn to it, and furthermore, the extent of the influence of pollen must be studied in the field and garden and not in the laboratory or with dried plants and fruits.

In a few of the more recent works of vegetable physiologists, it is admitted that the influence of the pollen extends to the entire formation of what is commonly called the fruit. Julius Loeke in his "Text Book of Botany," edition of 1882, page 495, says: "The increase in size of the ovary, which is frequently enormous (in eucurbita cocus, etc., several thousand times in volume), shows in a striking manner the results of fertilization, especially in the carpels, placenta and seeds; but very frequently similar changes result also in other parts. Thus, it is the receptacle that constitutes the fleshy swelling which is called the Strawberry, on the surface of which are seated the small true fruits." Also on page 504. "But sometimes the long series of deep-seated changes induced by fertilization extends also to parts which do not belong to the ovary, and even

to some which have never belonged to the flower." Among the plants so affected he mentions the Fig, Strawberry and Mulberry. Then again, p. 900, he says: "The process of development brought about by fertilization or the union of the reproductive cells is usually not confined to the resulting embryo, but shares itself also in a variety of changes in the mother plant itself."

This is what I claim to have seen in conducting my experiments with the Strawberry a quarter of a century ago—i. e., the influence of the pollen extended not only to the seed and fleshy receptacle or fruit, but to the fruit, stalks and the entire plant. Further investigations in the same direction have only confirmed my convictions in regard to the influence of the pollen reaching so far beyond the seed as to affect the fruit sufficient in many instances to change size, form, color and even the flavor.

In ordinarily practical operations it may not be of any great importance, but every fact in regard to such matter is of value in the hands of those who seek to know something of cause and effect in the cultivation of

according to Mr. Stokes, it excels it in productiveness and hardness, having wholly unprotected survived the last unusually severe winter along side of Cuthberts, many of which were severely damaged if not killed. From all that we can learn, the Golden Queen is a very desirable acquisition, and, all points considered, the most valuable yellow Raspberry ever introduced.

PLUMS AND POULTRY.

In former years it was not difficult to raise Plums, they grew naturally in abundance, but of late a good crop is of rare occurrence. Even in the woods, which formerly abounded with wild Plums, insects and disease destroy the fruit and trees. Some varieties are decidedly more subject to attack than others.

The Chickasaw is free from insects, and seldom fails to produce a crop, but the fruit is not nearly as valuable as the Wild Goose Plum. Of the latter I have some trees in my poultry yard which are bearing nicely. But of all the Plums I am acquainted with, the Damson is the hardiest and most exempt

from insect ravages. It is delicious for eating fresh, and for canning or preserving it is unequalled; it is also excellent for drying. Plum trees have always seemed to me to be possessed of some sociable nature, preferring a situation near dwellings. How well I recollect the Damsons growing in the yard near the old homestead of my youth, their branches reaching over the roof of the house, and affording an excellent opportunity to pluck the fruits from the attic windows. Coming to my present

domicile Damsons were among the first trees I planted. These are near the house where the fowls run under them, and they have never failed to produce an abundant crop. Plums and poultry grow well together, they seem to benefit each other, and anyone who plants the trees where the fowls have free run under them will not suffer much from insect attacks.

THOS. D. BAIRD.

SHORT CUTTINGS.

Bagging is not only the best preventive against rot in grapes, but it serves also an excellent protection against light and early frosts.

The Early Richmond Peach is rapidly gaining in favor; it is reported hardier and better than Crawford and many other popular varieties.

Professor Budd says fresh fruits may be preserved during long shipment by wrapping each specimen in tissue paper that has been soaked in salicylic acid. If the journey is very long, use double folds, and fill the interspaces with material similarly prepared.

THE GOLDEN QUEEN RASPBERRY.

plants in orchard and garden.—From an address before the American Pomological Society.

THE GOLDEN QUEEN RASPBERRY.

Yellow Raspberries have never become very popular in our markets, although one of the highest flavored varieties known. Brinckle's Orange is of yellow or orange color. The principal cause of this is probably that the best of the older varieties of yellow Raspberries were either so tender or so unproductive as to make their cultivation for market unprofitable.

Our illustration represents a variety, now being introduced by J. T. Lovett, Little Silver, N. J., which seems to be free from any objections to which other yellow Raspberries were liable. The Golden Queen—a single plant of it—was discovered by Mr. Ezra Stokes on his farm in southern New Jersey, growing among his twelve acres of Cuthberts. It may therefore be considered a re-seeing of this variety, which it closely resembles in all characteristic features, except color of the fruit, which is a bright, creamy-yellow. In flavor and size of berry it does not differ in the least from its parent, while,

Vegetables.

SEASONABLE HINTS.

All crops that are to be wintered out-doors should now receive their final covering.

Celery, if left in the ground where it grew, should be hilled up to the tips of the leaves, and afterwards be covered with an additional layer of six inches of soil. Later in the month, all is to be covered with several inches of leaves, or straw, and finished up with stalks or any other coarse material; some old boards laid on the top will give additional security. In wet or very heavy soil this method will be found more successful than wintering *Celery* in trenches.

Seed Potatoes.—Good crops are sometimes raised from poor seed, and poor crops have been grown from good seed, yet the results of a large number of carefully conducted experiments show unmistakably that it pays to plant only perfect seed.

Potatoes that have been exposed to so low a temperature as to have become "chilled," are materially deteriorated for seed—although they may still be in good condition for eating. The same is true of Potatoes stored in so warm a place as to make sprouting necessary.

The best temperature to keep *Seed Potatoes* in is from 35° to 40°. The cellar in which they are stored should be neither wet nor too dry; a moderately moist atmosphere is most favorable.

Cold Frames for Storing Roots.—Our last winter's experiment with wintering Carrots, Beets, Turnips, etc., proved so satisfactory that it may serve as a suggestion to those similarly situated.

Finding our furnace-heated house cellar too warm and dry for the best preservation of vegetables, we made our hot-bed serve the purpose, and are just now doing the same thing. After all the soil and decomposed manure was shoveled out and banked around the frame, the roots were spread in layers over the ground in the frame, giving the space of a sash to each kind. All were then covered with about four to six inches of soil. The space between the surface of the soil and the top of the frame was then filled out with dry leaves, and the sashes put in their places. The sashes were never removed except when something had to be taken from the frames. The leaves excluded frost completely and at the same time served as a non-conductor of the sun's heat, so that when, at the time of starting the hot-bed for spring use, the remainder of the roots were taken out, they were as fresh and good as the day they were dug. Thus a hot-bed may be used profitably the year round.

Compost.—A compost heap should be a permanent feature in connection with every well managed garden. Now is a suitable time to start one in an out of the way corner where it may be screened from view by a clump of bushes or an evergreen hedge. Swamp muck is the best material for the basis of a compost heap, but sods or rich soil from a roadside or pasture may be made to serve the purpose. All refuse and offal from the house and garden that will decay should find its place on the compost heap together with all the stable manure, and be mixed with the absorbing material.

MARKET GARDENING IN THE SOUTH.

History.—Social Questions Involved.—Growth.—Locations.—Soils.—Methods.—How to Grow the Different Crops.—Some Great Successes.—Causes of Failure.

BY DR. A. OENLER.

PRESIDENT CHATHAM COUNTY TRUCK FARMERS' ASSOCIATION.
Second Paper.

Commencing at Norfolk upon a small scale, truck farming has gradually extended down the Atlantic coast to all the larger cities whose trade with the North sufficed to support frequent and regular steamship communication, and along the lines of railroads into and through the whole of Florida, and encouraging the building of new lines, until it reached Mobile and Galveston.

At present Norfolk has during the shipping season a daily line to Baltimore, and, except Fridays, one to New York, and steamers thrice weekly to Philadelphia, Baltimore and Washington. Perhaps a half-dozen times in the season the Old Dominion Line finds it necessary to dispatch two steamers in one day to New York, and even with this augmented facility a large quantity of produce has been known to be left on the wharves for want of transportation to market. In the matter of frequency of steamship departures and their adaptability to the purpose, through sufficient ventilation between decks, Savannah comes next in order with three steamers weekly to New York and one each week to Boston, Philadelphia and Baltimore. The railroads offer facilities from Charleston, Savannah, Mobile, etc., North and West, but the bulk of produce goes, by preference when possible, by sea. This applies both to local and through-freights. Of Melons, however, large numbers are sent from the interior by rail North and Northwest, taxing the capacity of the various lines to the utmost.

The fact that the variety of vegetables grown at Norfolk includes such as the longer passage from more remote southern points precludes from the list of the latter, must increase the bulk of shipments from the former. Such for instance as Radishes, Lettuce, Spinach, and, in a measure, Muskmelons. The two first named wilt too much to command sure and fair prices, Spinach is too liable to heat in the package and Muskmelons or Cantelopes must be picked so very green only as far South as Savannah, to endure the passage, that the income from the crop becomes too uncertain. Increased competition from nearer points than formerly, however, has reduced the area of certain crops at Norfolk, increasing that of others proportionately. Such has been the case with Tomatoes, which, being an expensive and troublesome crop to cultivate, in consequence of the necessity of using glass to grow the plants, have failed of late to be as remunerative as heretofore, and have therefore partially given way to Cabbages and Potatoes. Only a few years ago an extensive farmer had 50 acres in Tomatoes. He gathered and shipped in one day 900 crates, but for want of labor had to leave 40,000 hills unplecked.

Neither of the last two seasons has been favorable; but, if the last had not been even less so than the preceding the shipments would have shown a more considerable in-

crease, as the acreages were greater. Florida farmers suffered, of course, less from the vicissitudes of the weather than those further North. Two disastrous spring frosts either killed some of the early vegetables in Georgia and South Carolina outright, or retarded them, bringing the crops into market and competition with those from Norfolk, reducing the value of all, and, in some cases, completely glutting the market. Later on, continuous wet weather impaired their carrying and keeping capacity by loading the produce with that superabundance of moisture which always tends to induce heating and decay in the packages, however carefully handled. This tendency to decay is greater to occur with crops grown on heavy soils, retentive of moisture, and less on the more sandy and porous soils.

Below are such statistics of the later years' crops as could be obtained to date.

NOTE.—These figures are only partial, as will be seen, and will be supplemented in an early issue by more complete figures.

HOW LETTUCE SEED IS GROWN.

Since writing the account of Mrs. Miller's Lettuce, it has occurred to me that a few additional remarks are needed. As a rule, the only way to be sure of getting good Lettuce seed is to grow it yourself.

As things now are, no seed grower can afford to raise Lettuce seed as it ought to be grown. The seedsmen will not pay over 75 cents or \$1.00 per lb. for it.

A letter just received from John M. Hunter of Houston, Texas, ordering (thanks to "Elm" and THE AMERICAN GARDEN) one-quarter of a pound of Deacon Lettuce seed, says: "If your seed is pure and you can keep it pure and as good as it now is you ought to have a tremendous trade from market gardeners, and if you have a boy or girl who takes an interest in the growing crop of seed another year, just say to him or her that I will give \$5.00 for a lb. of Deacon Lettuce seed from selected heads. I would rather pay \$10 or \$20 per lb. for such seed than have the common run for nothing."

Mr. Hunter speaks of keeping it pure. That is not where the truth comes in. Any seed grower can secure that by growing his crop of seed separate from other varieties.

The difficulty is this: The seed grower

grows Lettuce for seed. The market gardener grows Lettuce for good heads of sweet, tender, succulent leaves. He wants it to "cabbage." These two objects are diametrically opposed to each other.

The way a seed grower raises Lettuce is to get some "stock seed" and sow it in rows two feet apart early in the spring. Thin out the plants and pull out any "rogues" he may see and let the crop go to seed.

If the strain of Lettuce is up to the average he will get a fair crop of seed. If it is a good strain he will get a poor yield of seed. If the strain approximates anything like that Lettuce ought to be, he will stand a good chance of getting no seed at all!

Suppose a seed grower should try to raise Cabbage seed in the same way! The way good Cabbage seed is grown is to select Cabbage plants grown this year; winter them over and set them out for seed next spring.

But suppose we should sow some Early Jersey Wakefield Cabbage seed early in the spring, as we do the Lettuce, and let it run up to seed. Only a few plants it may be would produce seed, but by saving this seed and sowing it again the next spring we should very soon get a strain of Jersey Wakefield that would be a wonderfully profitable Cabbage for the seed grower!

The gardener does not want Cabbage that will go to seed the first year, and he has obtained his wish. He can get Lettuce that will not go to seed the first year, if he will take the necessary pains.

I am trying to winter over some Deacon Lettuce sown last spring in hopes of getting seed from them next year. In other words I propose to treat them as we do Cabbage, and see if we cannot make a biennial of it. But this is a plan I have not yet tried. Another plan that gives good results is to sow the seed in a hot-bed and set out the plants early in the spring and then leave the best heads to bear seed. Or the seed may be sown in autumn, the plants wintered in cold-frames and the best heads set out for seed.

We shall never have good Lettuce till we stop talking about varieties. The variety has little or nothing to do with it. It is a question of skill and perseverance in selecting good heads to raise seed from.

The fact mentioned by your correspondent "Elm" of the N. Y. Experiment Station that he had tested 150 varieties of Lettuce which are sold under 700 different names, does not show necessarily, a disposition on the part of seedsmen to introduce an old variety under a new name. A little care in selection may give a head of Lettuce so many desirable qualities that it seems like a new and greatly improved variety. And in this way, though an old sort, it gets a new name.

If seedsmen would say, "Here is Tennis Ball Lettuce seed grown from the very best and most carefully selected heads," experienced gardeners would be much more likely to try it than they would any new variety that was offered them. And this is true of Onions, Cabbages, Cauliflowers, Carrots, Parsnips, Turnips, Beets, Salsify, Celery and Radishes. The gardener grows all these plants, not for seed, but for artificially increased roots, bulbs, buds, leaves, etc. Crops grown for the seed, such as Peas, Beans, Corn, etc., are improved little by selection. We must look to new varieties. JOSEPH HARRIS.

THE RAM'S HORN SUGAR PEA.

Eatable-podded, or Sugar, or Butter Peas have so far not been extensively cultivated in the United States, while in France and Germany they are as highly prized as shell Peas. They may be grown and used exactly like other Peas, but they have that additional advantage that their green pods are so tender and sweet, that they may be cooked and eaten the same as String Beans. There are several varieties of this class of Peas offered by seedmen, but none has proved as desirable with us as the Ram's Horn, or Southern Mammoth Salad Pea. This variety of Edible-pod Pea has been grown in the neighborhood of the writer from a time "the memory of man runneth not to the contrary," and can be truly said to be acclimated to the Southern States, as its introduction here must have been with the very oldest colonial settlers. It has been super-

THE RAM'S HORN SUGAR PEA.

seeded in catalogues by the introduction of other varieties and is rarely found save in private families where it has been kept, like an heir-loom, from generation to generation.

As far back as 1739 Mons. de la Quinte, a noted French scientist, in his "Instructions for Fruit and Vegetable Gardens," referring to this Edible-pod Pea speaks of it as the "White, without Parchment, Large-podded or Ram's Horn Pea." The origin of the Pea is unknown, but all authors referring to it mention it as being the oldest and the best. "The pods are large, broad, meaty and crooked," which gives them the name of "Ram's Horn;" vigorous, very tall and very productive, and being thoroughly acclimated yields a full crop of very tender and succulent pods, bearing three weeks longer than seed of northern production.

The proper time for gathering is when the

Pea and pod are fully developed; they are then as brittle as German Snap-Beans, and are prepared in a similar manner for the table. The peculiarity of this Pea is its hull. When ripe for harvest the pod contracts to the Pea, assumes a transparency and is almost as thin as tissue paper. As grown here, this Pea measures one inch broad and five inches long, usually carrying six Peas.

The objection to all other varieties of running Peas is the expense of brushing or stickling, but wherever Cotton is grown this trouble and expense may be obviated by using the old Cotton stalks after the crop is gathered; planting the Peas on either side, they will climb and cling to the stalks for support. W. B. JONES.

Georgia.

MINT.

The principal value of Mint consists in the oil which is distilled from its leaves. Large quantities are raised in Wayne County, N. Y., in Michigan, and in Mississippi, the annual product of Peppermint-oil amounting to about forty-five tons. Yet as a garden herb for flavoring sauces, and other culinary purposes it occupies a not unimportant place.

In its wild state it is found along water courses, old stone walls and other damp places, yet it will grow and thrive in any good, deep garden soil. If the roots are transplanted in spring—although they may be taken up at almost any time, if kept moist—they will furnish cuttings all the season. Plantations should be renewed every third year. Cuttings grown in the greenhouse at a temperature of 75° to 80° will, in from six to eight weeks, furnish abundant growth for cutting, and if near a large city market there is always a ready, though limited, demand for Mint. For home use, a few roots in a rockery near the house, or in a mixed border, will supply all the needs of a good-sized family. W. H. BULL.

FRESH SPROUTS.

Seeds should be kept dry and cool.

Leek may be stored in treuches, by placing the plants upright, the roots close together, similar to the mode of trenching Celery.

Spinach for winter use should be lightly covered with straw or leaves to protect its leaves from injury by frost.

No soil in the world is naturally rich enough to grow garden crops to an advantage and profit; so says Joseph Harris.

Modern gardening, says P. T. Quinn, is simply another term for improved methods of farming, and success either in the kitchen or market-garden, depends upon carrying out these questions.

Cucumber from old seed fruit better, and Melon plants are shorter-jointed and flower at the third or fourth joint, when from fresh seed they would not give a flower until the tenth joint. This improvement of such seeds by age, C. M. Hovey says can be explained on scientific principles: when fresh they are fleshy and contain pabulum which gives vigor to the young plant, but with age they get rid of the surplus food.

Flowers.

FAREWELL TO THE OLD YEAR.

Farewell, old year, we walk no more together;
I catch the sweetness of the latest sigh.
And crowned with yellow brake this wintry
weather,
I see thee stand beneath this cloudy sky.

Here in the dim light of a gray December,
We part in smiles, and yet we met in tears;
Watching thy chilly dawn, I well remember
I thought the saddest born of all the years.

I knew not then what precious gifts were hidden
Under the mists that veiled thy path from sight;
I knew not then that joy would come unbidden
To make thy closing hours divinely bright.

I only saw the dreary clouds unbroken,
I only heard the splash of icy rain;
And in that winter gloom I found no token
To tell me that the sun would shine again.

O dear old year, I wronged a Father's kindness,
I would not trust Him with my load of care;
I stumbled on in weariness and blindness,
And lo! He blessed me with an answered
prayer!

Good-by, kind year; we walk no more together,
But here in quiet happiness we part;
And from thy wreath of faded Fern and Heather
I take some sprays and wear them on my heart.

THE FLOWER GARDEN IN DECEMBER.

Much work cannot generally be done during this, the dullest and darkest month of the year. There is no better time, however, when plans can be made and matured whereby the flower garden can be made to look prettier next season than it did in this.

EVERGREENS.

Although evergreen trees, the coniferous kinds especially, should find their proper place on the lawn, many of the low growing species are well adapted for planting in flower gardens, where, if properly arranged, they will add much to the variety in summer, and impart a bright, cheerful character in winter. It is at this season, when deciduous trees and shrubs have shed their foliage, that positions can best be selected in which evergreens will be most effective in winter without marring the harmony of the summer garden.

To those who have seen and studied the excellent collections of American evergreens, arranged in their different classes, which are found in the principal botanic gardens of Europe, it seems surprising that they are not more generally grown in their native land. The beauty of habit, vigorous growth and general, graceful contour which many species possess, make them admirably adapted for the decoration of the flower garden as well as the lawn. They are also useful in sheltering weaker and less hardy shrubs and plants. The reason why many fail to succeed with the latter class of plants is principally the want of shelter from piercing winds during winter. Evergreen trees or boughs form just the very best protection of this kind.

Erect growing evergreens, as the Swedish and Irish Junipers, are apt, during heavy snowstorms, to get their branches bent down, and often broken; to prevent this, tie the branches together at several places with strong string.

Among the best evergreens for planting in the flower garden are *Hovey's Golden Arbor-vitæ*, a dwarf-growing kind of globular form and with bright green foliage.

Geo. Peabody, a perfect little gem, compact in growth, the foliage of a beautiful golden color.

Tom Thumb is another compact growing kind, very dwarf, symmetrical, and well suited for various positions.

Retinispora plumosa and *R. aurea*, from Japan, are hardy, and their graceful, feathery foliage—golden tipped in the latter—makes them attractive objects wherever planted.

MAGNOLIAS.

The many beautiful species and varieties of this peerless genus are far too little seen in flower gardens and pleasure grounds. If lightly protected during the first two or three winters after planting, they generally grow and flower freely when once well established. Now is the proper time to protect those that have been planted last spring and have not yet fully recovered from the check of transplanting. Do not cover too closely, only sufficient to furnish partial shelter, and to protect against the direct rays of the sun. It is not generally the severe cold that kills plants of this kind, as the frequent thawings.

YUCCAS.

Yucca filamentosa is often destroyed in foliage during winter when allowed to stand unprotected; the best way to do with it is to gather the leaves together and tie with a good, strong string. A group of this plant makes a beautiful object in the flower border or on rock work. The leaves are radical, having white threads hanging from their margins. The white flowers are borne on flower-stems about three feet high. *Yucca Whipplei* is another good hardy plant of this class, and for the Southern States *Y. gloriosa*.

TOP-DRESSING.

Perennial plants of nearly all kinds, and young evergreens especially, are much benefited by a good top-dressing of manure during winter, especially such kinds as are making a weak growth; it stimulates them, gives them better colored foliage and makes them altogether finer and stronger looking specimens. Life is too short to wait for plants when making a weak and puny growth. We want them large as soon as possible and the only way to accomplish this is to give them plenty of food. Healthy plants are always less liable to the attacks of insects than weakly growing specimens, therefore keep them always growing and in a vigorous condition, and less complaint shall be heard from them being destroyed by insect attacks.

M. MILTON.

HEALTH AND PLEASURE FROM FLOWERS.

A WOMAN'S EXPERIENCE.

Seated in my easy chair with leisure to meditate and write, I take this very first opportunity to review my past ten months' work—exultant over my many successful achievements—sorry over my few failures, but in no wise discouraged.

At the beginning of the year I resolved for the twentieth time not to invest a cent in any new plants, as I had already crowded in my flower garden a chaotic mass of every imaginable and conceivable variety of plants that I could buy, beg or exchange for. With a sigh I closed my new catalogues saying, "Well, there's much in it I want, but I have no place for more." But desire was followed by resolve. "Where there's a will

there's a way." I began to look around to examine the capacity of my kitchen garden, and to my delight, I concluded with higher culture, I could with one-eighth of ground less manage to raise all the vegetables and fruits I wished and have that area for some new flowers.

My strongest desire lay in having the largest amateur collection of new-named Chrysanthemums. First I thought two dozen would more than satisfy me, as I had already thirty-five distinct, though unnamed varieties. Those came and were tenderly pottered, being the very cream of all my catalogues, of various and divers colors and shapes. A little later I concluded two dozen more would be charming to have, ordered, and ended by not only purchasing 100 new varieties but bought two packets of seed, and now to date I have thirty-five old, fine varieties, 100 new-named, and fifty new seedlings.

Being satisfied in that direction I wanted more Roses. Sunset, Md. Cusin, Jules Chrétien, etc., I had one of each, but—I must be greedy—I wanted more. Off went my order, wholesale, and back came my Roses by the hundred. Oh, how I gloated over their promise! Md. Guinessean, Perle des Jardins, Jules Finger, etc., too numerous to mention; and how I worked in spring to plant and care for them, and how they have so well repaid me for all my care.

Then I became afflicted with the flower fever badly, what I felt unable to buy I began to exchange, and I stand almost aghast at my year's work, and wonder I live to tell the tale. Two thousand bulbs of twenty-three varieties of Lilies, 100 new Roses, 175 Chrysanthemums, and other plants from Maine to California have come to be welcome and cherished pets in my grounds, for I encroached and still encroached upon my vegetable garden until I now have one-half of it in flowers. Three long rows of beautiful and deliciously fragrant Tuberoses, but not satisfied with keeping for my own ground, I had the temerity to experiment with sets to see if I could raise them for the trade, was laughed at and teased about my bulbous fever. Had a brother-in-law to write me 100 miles distant and expostulate with me. No use, at it I went with my whole soul, and with what result! Thirty thousand Tuberoses, as fine and large bulbs as any professional florist has ever raised, are coming in my central yard.

After my Tuberoses fever, I ordered a whole case of hardy Holland bulbs, and words can hardly describe the pure delight in just handling them. I could scarcely realize the exquisite beauty folded away in their rough coats; but with full faith and great care they are now planted. Five hundred Hyacinths, 1,000 Tulips, 800 Narcissuses, and Scillas, Ixias, Spuraxias, Lachenallas, Bublunas, Alstromerias, Freesias; all of which are potted or planted out in my yard.

In this retrospect I see much left undone, but far more accomplished than in my wildest dreams I had hoped for. With my increase of plants an increase of glass quarters became necessary, and my busy brain went to work to accomplish that. I purchased ninety-three sashes of a church recently torn down, and now a fair and beautiful greenhouse nearly completed, 13½ feet wide by

32 long, greets my eyes with hopefulness. I may well feel exultant over my year's work, working with this in my mind: "What thy hand findeth to do, do it with thy might." Much enjoyment was derived from the collecting of so many new and rare plants which I hope to enjoy next spring, and from watching the unfolding of their leaves and blossoms I anticipate many a day of rare pleasure. In my year's work are garnered up many pleasant memories of friends and flowers besides preparing joys and occupation in tending my pot-plants in my new greenhouse. My year has been a busy one, and not profitless, but full of intense enjoyment of this my favorite work, cultivating, collecting and caring for God's beautiful flowers. I began the year with impaired health and weakened nerves; its close finds me with much improved health, with nerves stronger and with renewed interest in life and its duties. Outside of everything else floriculture rewards us in this, if in no other way, with better health and clearer minds for other duties of life. Try it, my sisters, and see for yourselves.

Mrs. THOMSON.
South Carolina.

CHRISTMAS ROSE.
Helleborus niger.

There was a time when real Roses at Christmas were a rarity, and when the Christmas Rose, from the peculiar habit of the plant to bloom in winter or very early spring, was held in high esteem. But now the florists' art has, in some measure, annihilated seasons and the habits of plants, so that Roses are about as abundant at Christmas as in June. Yet the Christmas Rose is a very pretty and interesting plant, well worthy of a place in the mixed border or among shrubbery. It belongs to the natural order *Ranunculaceae*, or Buttercup, and its flowers resemble the Marsh Marigold in shape, but are larger, and in the original form pure white. Within recent years the species has been "broken," or hybridized, and there are now a number of named varieties varying in size and many shades from light pink to purple. The plant is a low-growing perennial which should be grown in deep, rich soil, in a shady and sheltered position, and be covered with leaves in winter. If grown in a frame or in pots there will be no difficulty in making it bloom true to name—at Christmas, otherwise it might cause disappointment. It is a native of Southern Europe, and is easily propagated by division of the roots.

NICOTIANA AFFINIS.

Most persons who have tried this recent introduction, have done so with some misgivings. Being a species of *Tobacco* it was hardly thought to be a fit occupant of the flower border; yet it has proved to be a valuable acquisition. Its flowers are pure white, of delicious fragrance, produced in great abundance, and continue—well, forever we are almost tempted to say. The plant was introduced as an annual, and may be treated as such, but from what we have seen of it, it behaves very much like a perennial, and the experience of some of our readers points in the same direction.

I am puzzled about the nature of the *Nicotiana affinis*, writes N. T. Lackner. Plants that have bloomed for five months, and were planted out in the garden, have made new shoots and flowered all summer. A large

PROTECTING ROSES.

However hardy a Rose may be, in the climate north of New York it will be benefited by a light covering in winter. The half-hardy kinds, as Teas, Bengals, and most Bourbons have to be well protected if we would winter them safely out-doors, but with the hardier kinds a very light shelter will be sufficient. In either case the plants should not be covered before winter sets in in earnest, generally not before the first week in December.

The easiest and most efficient way is to peg down the plants, and strew dry leaves between them, so as to cover them entirely, then place over them evergreen branches, or brush, or poles to prevent the wind from blowing them away. Hilling up with soil is also practiced by many growers, or the plants may be taken up entirely, placed in a trench in a dry position and covered with soil.

As the hardest Roses, H. B. Ellwanger named: Abel Grand, Anne de Diesbach, Baron de Bonstetten, Baronne Prévost, Baroness Rothschild, Boieldieu, Caroline de Sansal, Charles Margottin, Countess of Serenye, Edward Morren, François Michelou, General Jaquemint, Jules Margottin, La Reine, Mabel Morrison, Madame Boll, Madame Jolly, Marchioness of Exeter, Marguerite de St. Amande, Marquise de Castellan, Maurice Bernardin, Rev. J. B. Camm. As the most hardy Monthly Roses: Appoline, Edward Désfosses, Hermosa, Louise Odier, Aimée Vibert, Caroline Marniesse, Gloire de Dijon, Reine Marie Henriette, Bongère, Gerard Desbois, Horem, Madame de Vetry, Marie Ducher, Sombrenil. And a very good list it is.

THE CHRISTMAS ROSE.

plant in a ten-inch pot, by being well fed, is acting the same way in the greenhouse. It has never stopped blooming since January, and was a mass of flowers all winter. Other plants sown June 26th of last year, wintered in small pots, and planted out this spring, produced an abundance of fragrant flowers all summer. It grows, I believe, under any conditions, and is worthy of a place in every garden.

Our Sweet Peas came up poorly this year, much to our disappointment, at first, but as the plants grew and blossomed, those that were a foot and more apart bore by far the largest and best flowers, and in greatest profusion, from which observation the conclusion may be deducted: Give plenty of room to Sweet Peas.

OUR FLOWER BASKET.

Colocasia esculenta, Tanyah, bulbs have to be kept warm and very dry, else they will surely rot.

We do not know anything mice are more fond of than *Tigridia* bulbs. After the bulbs are well dried, the safest place to keep them is in a tin box. They must be kept warm.

Chrysanthémums, although generally hardy, suffered severely last winter, even in cases where they were covered with manure. To be perfectly safe, the clumps should be taken up and placed in a cold-frame over winter.

The Window Garden AND GREENHOUSE.

THE BLUE AFRICAN LILY. *Agapanthus umbellatus.*

This old and well-known greenhouse plant appears to become quite a favorite with amateur cultivators, judging from the numerous inquiries respecting its culture that are to be found in our horticultural periodicals. It is a plant of vigorous growth, having thick, fleshy roots and linear leaves, flowering during the summer season. The flowers, which are of a bright blue color, are produced in large clusters on a stout flower stalk about three feet in height.

The plant is of easy culture and succeeds best in a compost of two-thirds sods, one-third well-decayed manure with a fair sprinkling of bone dust; good drainage is also essential to success, for although the plant requires an abundance of water during its season of growth, yet it will not do well if water is permitted to stand around its roots. As the plant must become strong and large before it will bloom it should not be permitted to become pot-bound when small, but should be grown on as rapidly as possible, and shifted as often as necessary until it is placed in a 10 or 12-inch pot; by that time it should be large enough to bloom.

During its season of growth, which is in the summer, the plant should be given an abundant supply of water, but after it has ceased flowering and its season of growth is over, water should gradually be withheld, and during the winter, only enough given to prevent the plant from becoming absolutely dry. It may be brought out from its winter quarters early in May, and as soon as the nights begin to be frosty in the fall removed inside, where it can be wintered over in a light, dry, frost-proof cellar, or under the greenhouse stage, if care be taken to prevent it from becoming too wet.

Propagation is effected by a careful division of the plant, and this operation is best performed in the spring just before the plant starts into growth, but if the offsets are small they should be well cared for and nice specimens will soon be obtained. After the plant has attained its full size, and is growing in a large pot or tub, it should be re-potted—in spring—in fresh soil every two or three years, otherwise it should be watered at least twice a week during the entire season with weak liquid manure.

CHAS. E. PARNELL.

ABOUT CALLAS.

To grow the Calla well, you must give its roots plenty of room, and let the young plants remain about the old one until you have at least a half-dozen stout plants in the tub. I have a seven-year-old plant which I have given plenty of room, and which has not been disturbed in any way during that time, unless the annual removal of a share of the old soil can be called a disturbance, and it has a very different appearance from the Calla plants one usually sees. It has over thirty leaves, some of them standing nearly four feet above the pot, and it often has from three to six flowers at a time. I use a very rich soil from the barnyard, mixed with

sharp sand. In summer I give just enough water to keep the plant from drying up. In September I remove as much of the old soil as I can conveniently, and put in new. Then I increase the supply of water gradually. In winter I always apply it warm. This old plant is highly ornamental when not in bloom, because of the profusion and luxuriance of its foliage. When in blossom it is one of the most superb ornaments a conservatory can have. If you want many flowers from the Calla you must let the young plants remain.

EBEN E. REXFORD.

ROSES FOR WINDOWS.

The very best Rose for growing in the window is "Agrippina," I am inclined to think. It blooms more profusely than any other variety, and produces more branches,—a necessary condition to the satisfactory cultivation of any Rose, because the new growth must be depended on for flowers.

Next to Agrippina I would place "Queen's Scarlet," which greatly resembles it in habit. But neither of these Roses are as fine as many other varieties. But, if we cannot grow the best well in the house, we must be satisfied with inferior ones which will accommodate themselves more readily to circumstances.

I have no difficulty in keeping them free from the aphid, if I dip them in Tobacco-tea twice a week. Syringing the infusion over the plant does not suffice. As soon as the buds on a branch have developed, I cut it back to a healthy and promising bud, to induce a fresh growth. The red spider will not trouble the plant if you use enough water on it.

E.

BONE MEAL FOR IVY.

Have you ever tried bone meal as a fertilizer for the English Ivy? writes a correspondent from Wisconsin; if not, do so. I had an old Ivy which seemed to be in a stand-still condition. I re-potted it; it wouldn't grow; then I mixed some bone meal with the soil, digging it in well about the roots. In a short time it began to stir itself. It put out new leaves from the ends of the old branches, and soon new branches started, and during the summer it has made a rapid growth. I give the bone meal credit for it all. Try it.

TROPAEOLUMS.

Many species and varieties of this interesting genus are among the most desirable window plants, especially those of the *Lobbianum* class, which are not excelled for training along the rafters of greenhouses or around the frames of windows. If enough sun is given them they will be a mass of bloom all winter. They should have a rather sandy soil and not too large pots else they are apt to produce more leaves than flowers. It strikes freely from cuttings and may also be raised from seed.

THE CIGAR PLANT.

Cuphea platycentra.

This little gem of a plant is so old that most people have forgotten it, and welcome it as a novelty again when they chance to see it. It is not only one of the most profuse bloomers in the flower border, but when potted it makes a charming window plant, being covered all winter with its cigar-shaped bright scarlet flowers, tipped with a ring of black and white.

ORCHIDS.

CLASSES,—RARITY,—CULTURE.

Orchids abound throughout the temperate and tropical regions of the world, but not in dry, arid districts. They are represented by two classes, namely: terrestrial and epiphytal, both of which contain many lovely species and varieties.

TERRESTRIAL ORCHIDS

Are those that grow in the earth, like our Lady's-slipper, or in the mossy surface on the earth, for instance the *Calopogon*. But these are hardy. Those we grow in our greenhouses are tender and comprise *Bletia* from Mexico, *Phajus* from China, *Calanthe* from India, *Disa* from the Cape of Good Hope, *Cypripedium* from Colombia or Borneo, and several others.

EPHYPYAL ORCHIDS

Are the ones commonly called Air-Plants. They abound in warm, moist countries, but do not occur in cold countries. In the Southern States one or two inconspicuous flowering species of *Epidendrums* are found, and of recent years several of the epiphytal Orchids peculiar to the West Indies have been discovered in Florida. None occur in the Northern States. These Orchids cling to the bark of trees by their thick, matted roots, and occur in bunches high up among the boughs or attached to small branches or on mossy, rocky places. Epiphytes are not parasites, they do not live upon the juices of the trees to which they fasten themselves, but on the moisture in the atmosphere. The graceful *Oncidiums* and gorgeous *Cattleyas* of Brazil, magnificent *Dendrobiums* of India, chaste *Phalenopsis* and choice *Vandas* of the Eastern Archipelago, and the curious *Angraecums* of Madagascar are notable examples of epiphytal Orchids.

WHY ORCHIDS ARE CHOICE PLANTS.

Because the desirable kinds have superlatively lovely flowers, and in most cases these flowers last a long time in perfection, many of them as those of *Angraecum eburneum*, thirteen weeks. And as cut flowers, no blossoms, "everlastings" omitted, last longer. With a love for them, and attention and convenience for growing them, Orchids are easily grown, "live for ever," bloom year after year, and increase in size and value.

WHY ARE ORCHIDS SO EXPENSIVE?

Because we cannot propagate them as readily as we can Carnations or Fuchsias, by cuttings, division, seed, or any other means; indeed, it is extremely slow work, and the vast majority of the Orchids in cultivation have been imported from their native wilds. Standard kinds, as *Dendrobium nobile*, *Lycaste Skinneri*, *Cypripedium insigne* and *Odontoglossum Alexandre*, have an established value and are always salable. In price, for nicely established, flowering plants, they rate from \$2 to \$5 each, or more or less according to the size and condition of the plants.

THE HIGHEST PRICED ORCHIDS

Are newly discovered and introduced species, for instance, *Vanda Sanderiana*; extremely scarce species as *Cypripedium Godfreyi* and *Cattleya labiata*; extremely fine and rare varieties of species, for example the white-blooming varieties of *Lycaste Skinneri* or of *Cattleya Skinneri*; and desirable garden hybrids of which the stock is limited, as in the case of *Cypripedium Morganianum* and *Cattleya Keoniensis*. While these are highly

prized by Orchid-fanciers, beginners should let them alone; for their purpose good, common sorts are much to be preferred.

COOL ORCHIDS.

Disas, Masdevallias, many Odontoglossums and some others are commonly called "cool" Orchids because they are natives of high mountain altitudes, and cannot be grown satisfactorily except in a cool (but above the freezing point) temperature and moist atmosphere. From this we might infer that these "cool" Orchids would be the best for amateurs to begin with, but as a rule they are not. Such excellent gardeners as Rob-

THE "SOIL" FOR ORCHIDS

Is nothing but clean, fresh sphagnum (swamp) moss, broken pots washed clean, and charcoal. For terrestrial Orchids many growers use turfy loam and peat, also for many epiphytal Orchids they use fibrous peat mixed with the moss, but as every exotic Orchid—terrestrial or epiphytal—that I know of can be grown in perfection without either loam or peat, I should advise beginners to confine themselves to the moss alone. Poor peat is miserable stuff. After a few months of use it becomes pasty and sour and the roots that have worked their way into it die.

pseudo-bulbs I am very careful that these "bulbs" sit clear above the compost, for if they do not, they together with the eyes or new growths that emanate from their base are apt to rot off. For *Dendrobium* I use less compost and more drainage. In all cases the compost should rise above the pot.

WATERING ORCHIDS.

I keep my *Cypripedium* well watered all the year round. But all the genera having thick, fleshy, pseudo-bulbs or stems, I keep somewhat dry in winter and moist in summer, but at any time avoid keeping them so dry as to cause them to shrivel. Avoid pour-

LYCASTE SKINNERI.

inson, Gray, Allan, and Harris grow them well, but in the majority of Orchid-growing gardens, the "cool" Orchids are the most wretched of all.

BEST ORCHIDS FOR BEGINNERS

Are those of "cast-iron" constitution, that will bear a deal of rough usage and still grow and flower, and will grow well in the sitting-room window. Half-a-dozen of these are *Dendrobium nobile*, *Lycaste Skinneri*, *Caelogyne cristata*, *Cypripedium insigne*, *Odontoglossum citrosimum* and *Maxillaria picta*. All of these will thrive in a winter minimum temperature of 45°.

Terrestrial Orchids should be grown in pots, but epiphytal ones may be grown on blocks, in wood, log-cabin-like baskets, or in pots, but as all can be grown in pots I shall confine myself to pots. The pots should be well cleaned both inside and outside. For *Cypripedium* I half-fill the pot with broken pots and charcoal for drainage, then mix finely broken potsherds and charcoal with live moss, and in potting use this compost to fill up to the brim of the pot with, and finish off with a layer of clean moss. For *Lycaste*, *Maxillaria*, *Caelogyne* and *Odontoglossum*, I use about the same, but as all of these have

ing water on their "bulbs" or crowns and observe that water never lodges inside the young growths, else they may rot off. Of course, dewing them gently overhead in the afternoon is beneficial to them, but see that no water lodges on the leaves or in the growths. Without a moist atmosphere Orchids cannot thrive. While we winter Orchids in our windows, in summer they should be put out-of-doors, where they can have an abundance of water, where direct sunshine cannot reach them, and they are protected from drip and drenching rains. Don't plant them out.

WM. FALCONER.

Lawn and Landscape.

PROTECTING THE LAWN.

Late autumn is the best time for top-dressing lawns. But little evaporation goes on at this season of the year to draw off the most valuable and readily available portion of the fertilizer applied, as is the case with top-dressing applied in the hot, dry weather of mid-summer. Top-dressing in mid-summer may sometimes be necessary as a protective mulch for the grass roots in times of drouth; but for the real work of fertilizing, fall or spring top-dressing is vastly superior to that of summer. The rains and melting snows of winter and spring carry the fertilizing material down through the sod, and distribute it where the roots can get a hold upon it readily. This is especially the case with barnyard manures no matter how well rotted they may be when applied. It is the juices and soluble portions that get washed down within reach of the roots, that do the work. Its bulk remains above ground, and, unless very fine indeed, may have to be removed after it has served its purpose. It is easy to be seen that such manure applied to a cleanly shaved surface like the lawn, in scorching, dry weather, is extremely liable to lose the largest share of its available fertility by evaporation.

I often wonder that lawns look as well as they do. To be sure the soil is, or certainly should be, made very rich to start with; but how much of this deep, rich soil is really available to the limited roots of the closely cropped lawn grass? Where the top growth of plants is constantly kept down from the very start, the root growth is also proportionately limited. Rank-growing meadow grasses send down roots sometimes to the depth of several feet, but the roots of lawn grasses descend but a few inches. No matter how deep and rich the soil may have been made at the start, the surface must be kept fertilized if we would keep up that deep, rich, velvety green that is the great beauty of the lawn.

Again it is a wonder that the lawn does not suffer more from drouth than it does. What other portion of garden or field is kept so exposed to sun and wind? Its surface never has that protective covering of plant growth that Nature intended as a provision against drouth and excessive evaporation. The cuttings from the mower fall back upon the lawn to be sure, but as a protection to the roots what do they amount to after the sun has had a two-hours' chance at them?

Still fewer lawns receive proper attention in winter. The smoothly cut surface has nought to protect it from alternate thawing and freezing that is so fatal to all grass roots. It has not growth enough to catch and hold the snow, that best of all mulches, where it can be held evenly over the ground. An open, variable winter means partial ruin to thousands of lawns.

Well-mulched lawns are comparative rarities. Where one is mulched in autumn twenty remain bare and unprotected. It is a great pity, after a lawn has become well established, to allow it to be damaged in this way. A coat of partially decomposed manure would save the sod, and at the same time furnish the needed fertilizing material.

This mulching should be applied late in autumn or early winter after the surface of the ground has become frozen. Mulching then will keep the ground in a frozen condition, thus preventing the working of mice and moles in the soil that might be induced to take refuge among the mulching material.

In winter we can best see the necessity of providing evergreen wind-breaks for the lawn. An exposed, wind-swept lawn is much more difficult to protect than a sheltered one. If one is near a forest where evergreens are to be had, he would often do well to cut a number of good-sized ones, bore holes in the ground and set the stems in them about the lawn in a hedge shape, or so distributed that they will best serve as wind-breaks to exposed portions. This is an excellent recourse until natural growth can be provided where wanted. W. D. BOYNTON.

HARDY RHODODENDRONS IN NEW ENGLAND.

I was quite interested to read the statement in THE AMERICAN GARDEN that many or most of the supposed hardy Rhododendrons had succumbed to the inclemency of the winter, because it fully corroborates my statements made in the "Magazine of Horticulture" twenty-five years ago.

In 1844 on my first visit to Europe, I spent a day with Mr. Waterer of Woking, father of the present Mr. Waterer, and an enjoyable time I had looking through his immense plantations of this beautiful shrub, though it was in September. But I could well imagine the splendors of the display in June. What struck me was the great number of beautiful standards six or more feet high. A day and night I staid with Mr. Waterer enjoying his kind hospitality, and had an interesting chat with him in regard to the production of seedling Rhododendrons and Azaleas, stating to him that the old *R. arboreum* was a greenhouse plant with us, and unless the hybrids which he had produced were not nearly or quite as hardy as our *R. Catawbiense*, there was little hope of introducing the splendid varieties he had reared. He stated that he had five seedlings of *R. Ponticum* which were quite as hardy as the *Catawbiense* and far more beautiful, with a variety of colors though not so grand as the semi-hardy sorts; and with his aid I selected twenty kinds, two plants of each for trial.

These hardy kinds were as follows, which I take from the invoice before me dated October, 1844.

Delicatissimum, Erectissimum, Bicolor, Bicolor flore pleno, Celestinum, Purpureum elegans, Multinaculatum, Pictum, Roseum elegans, Celestinum grandiflorum, Gloriosum.

The other nine were varieties which Mr. Waterer thought were just as hardy, though they were a further remove from the *R. Catawbiense*.

All the plants were carefully planted in well prepared soil, and every attention given to have them succeed. For one or two years they all appeared about of the same hardiness, when we had one of our severe winters, and then all were seriously injured and partially killed but the above named sorts.

I at once came to the conclusion that no Rhododendron was perfectly hardy, unless grown from *Catawbiense*. I began raising seedlings from those that survived, and have produced a race just as hardy as the

Oak. To be sure there are no crimsons and scarlets among them, but white and all intermediate shades between that and *Purpureum elegans*.

My imported plants are now forty years planted and fully 15 feet high, as are also many of the seedlings I raised from 1847 to 1850. From 1844 to 1860 I planted more than 200 of the finest varieties of Rhododendrons to be procured in England, Belgium and France, and I have not to-day one single plant left in the open ground.

It was after such experience that I made the statement that none of the so-called hardy hybrids were perfectly hardy in our climate, and although it was denied by many cultivators, the statement of THE AMERICAN GARDEN seems to corroborate my opinion of twenty-five years ago.

Boston.

C. M. HOVEY.

RHODODENDRONS IN MARYLAND.

Let me add, writes "Chestnutwood" from Hampden, Md., a few varieties of Rhododendrons which have withstood last winter well with me, besides those mentioned in September number of AMERICAN GARDEN. *Abraham Lincoln, Aurora, Bertie Parsons, Bicolor, Blaudum, Blandyanum, Candidissimum, Celestinum, Chas. Bagley, Delicatissimum, Gen. Grant, Minnie, Purpureum crispum, Doctor Torrey and Amarantinora.*

As an edging for Rhododendron borders *Daphne Cneorum* cannot be recommended too highly, being perfectly hardy, standing pruning well and giving forth its delicate, sweet-scented, pink flowers from early spring until late in autumn.

VALUABLE NEW TREES AND SHRUBS.

In answer to an inquiry about the best ornamental trees and shrubs of recent introduction, S. B. Parsons names the following:

Cornus florida flore rubro, Red Flowering Dogwood.—This is without exception one of the most desirable and most showy flowering trees, which will surely meet with general favor. To the well-known charming qualities of the common Dogwood, with its rich autumnal foliage, it adds red flowers.

Cornus florida pendula, Weeping Dogwood.—A form of the common Dogwood with perfectly drooping habit and the upright leading stem of the weeping Beech, which will obviate the necessity of high grafting or training. Few weeping trees have so many good qualities.

Euonymus alatus, Cork-barked Burning Bush.—A small tree possessing all the excellent qualities of the genus, with the peculiar cork bark and a charming vermilion-tinted autumn foliage.

Euonymus Yedoensis, Japanese Burning Bush.—The leaves and stems of this species are larger than those of the European kinds, and its autumn foliage is most striking.

Viburnum latifolium, Broad-leaved Snowball.—This has larger foliage than the Japanese Snowball, and a more vigorous habit. Its striking character makes it valuable for landscape effect.

Viburnum latifolium variegatum is a beautiful variegated form of the preceding with white and green foliage.

Hypericum aureum, Golden St. John's Wort.—A valuable and charming dwarf shrub of symmetrical habit and abundant large, yellow flowers blooming through the summer.

Foreign Gardening.

GARDENS IN ALGIERS.

The suburbs of this strange, old town, placed, as they are, on a northward-facing hill, from their cool exposure are favorably situated for gardening. The want of water, the great natural difficulty of the town, and indeed of the whole province, is overcome by a system of irrigation, the supply being carried through aqueducts, some of ancient, and others of recent construction. The climate suits the greater part of what are classed as sub-tropical plants.

Within a mile or two of the town, and mainly in the northwestern suburb, are many gardens, old and modern. Here in former days the wealthy Arabs had their villas, with gardens of many acres carefully terraced and irrigated. Some of the older ones are rich in picturesque groups of Olive and Caruba, stately Cypresses, rambling Vines and guarded Pomegranates, whose pale gray stems, polished undulating leaves, and brilliant flowers are to a northern eye a strangely striking picture of plant beauty.

The high garden walls, roughly plastered, and originally whitened, but now dim and gray with age, were not hidden by groves of Orange, Lemon or Shaddock. Stately Bamboos, Cypress or Myrtle, are clothed with a variety of fine rambling plants, of which *Bougainvillea*, *Plumbago Capensis*, *Solanum Jasminoïdes*, white Jasmine, and Tea and cluster Roses are perhaps the most frequent. Hedges are made of Lantanas; *Magnolia grandiflora* is a very large tree; weird Prickly Pears are draped and festooned with *Clematis cirrhosa*; and the white *Brugmansia* rises high and overtops the wall, its great, white trumpets and large leaves borne aloft on a sheaf of straight, strong stems.

Date Palms form groups of majestic beauty; Rosemary is at home, and is commonly used for low hedges and edgings, but is apt to ramble away at will into forms of picturesque raggedness. Poinsettias grown as eight-foot-high standards and pruned annually with a bill-hook, are a mass of scarlet glory at Christmas. Ipomœas, crimson and blue, and Bignonias ramble through trees and bushes; *Tecoma Australis*, either rambling or trained to walls, surprises one by its delicate beauty; and Hibiscus of kinds are frequent garden plants. In open-air cisterns are strong growths of Arums, Nelumbiums and Papyrus.

Sometimes a garden encloses a half-wild, narrow dell with a trickle of water. Here will probably be a thick growth of Oleander and the wild *Arundo Donax*, the great Reed often 30 feet high; then clumps of *Acanthus mollis*, and perhaps a grand, old, white-stemmed Bay, with straight, vigorous, young growths shooting from the base. In such a dell, damp, sheltered, and half-shaded, may generally be found a grove of Bananas, those conditions being suitable for their cultivation.

The Arab houses are built of rubble masonry, plastered and invariably whitewashed both inside and out. The central court is often highly decorated; the passage or gallery that gives access to the upper rooms is supported by horse-shoe arches springing from slender, twisted columns. Between

and over the arches the wall space is panelled with glazed tiles of fine design and coloring, generally of two or three colors on white ground. The railing which forms the parapet of the gallery is of wood-work, elaborately pierced and turned. In such a court, a few small Palms in tubs and other suitable subjects form delightful pictures of combined house and plant beauty.

Many of the French and also the English winter residents who have built villas in the beautiful suburb of Mustapha have wisely adopted the Arab's style of building, which, though externally of extreme simplicity as to its main parts, groups admirably with the evergreen trees of the country, and with the wealth of flowers that these gardens are capable of producing.—*London Garden.*

A COCHINEAL HACIENDA IN GUATEMALA.

Cattle ranches, sheep ranches, even chicken ranches, are common enough in the United States, but a bug ranch is indeed a curiosity! In this queer country the raising of hemipterous insects of the bark-lice family, notably the *Coccus Cacti*, or Spanish cochinita, is a profitable, if not a pleasant industry. In this portion of Guatemala vast plantations are devoted to the cultivation of the "Indian Fig," or Nopal, a Cactus, *Opuntia cochinitifera*, especially for the nourishment of bark-lice. Between the altitudes of 3,000 and 5,000 feet is the favorite locality for cochineal raising, particularly in the vicinity of Guatemala la Antigua, the ancient Capital.

The cochineal hacienda, which we were invited to visit, is the property of Senor Don Felipe Ortiz de Espanosa, and lies about six miles from the city of Quezaltenango. The Espanosa family reside during half the year upon it, in the midst of unnumbered millions of bugs. Happily the insects are not migratory in their habits, but cling with remarkable pertinacity to their Indian Figs, or otherwise a residence among them might be the reverse of agreeable.

The hacienda is walled and bastioned like the domain of a baron of old, with corner towers and loop holes for guns, and shows indubitable traces of having withstood many a revolutionary siege. Upon arriving—accompanied by a pleasant party of Castellanos from the city, and escorted by the genial proprietor—we galloped, according to universal custom, through the one front door of the casa, directly into its inner court, where, amid an indescribable conglomeration of dogs, pigs, goats, burros, and other domestic animals, our horses were given to the care of the servants, and ourselves warily welcomed by the Señora de Espanosa and her bevy of dark-eyed daughters. Being only nine o'clock in the morning, it was, of course, too early by some hours for breakfast; but, under the blossoming Lime trees of the garden, coffee was immediately served, accompanied with *pan dulce* (small loaves of sweetened bread), goat's milk cheese and Pomegranates—all of which delicious, you may be sure, disappeared in a twinkling before American appetites, "sharp set" by a six-mile morning easter!

Breakfast was served at the usual hour (about one o'clock P. M.), consisting of a dozen elegant courses, with excellent Spanish wines and all imaginable fruits and salads, supplemented with cigarettes for both

ladies and gentlemen, and strong, black coffee. At five o'clock came the inevitable chocolate, with more *pan dulce*, cheese and wild honey. Dinner we could not remain for, though pressed to do so, as that meal is never partaken earlier than seven in the evening, and we were obliged to return to the city to meet engagements on the morrow.

The Espanosa plantation of *Opuntia cochinitifera* includes 1,000 acres, and the modus operandi of cultivating the insects is most curious. They require about the same care that is ordinarily bestowed upon silk-worms, and probably the occupation is not more loathsome of caring for crawling and wriggling creatures. During the last days of May, immediately before the annual rains begin, great branches of *Opuntia* covered with insects are cut off and stored in a building erected for that purpose, to protect them from the weather. At the close of the wet season (about the middle of October), the plantations are restocked from these supplies by suspending little nests—made of henequin, jute, maguey, or any other soft, woody fiber—upon the spines of the growing Nopal, each nest containing a dozen female insects. Warmed by the tropical sun, they soon emerge from their semi-comatose condition and begin to lay eggs with marvelous rapidity, each female producing more than 1,000 young. The new crop spreads over the plants immediately, the females at once swelling to surprising size, and attaching themselves so closely to the Nopal as to become almost a part of it—resembling vegetable excrescences rather than animate insects. In this condition they are gathered for cochineal, none but the pregnant females being valuable for commercial purposes. The males are comparatively few in number, not more than one male to 150 females, and are of no use for coloring material; the females are picked off with a blunt knife and killed by dipping in boiling water, or baking them in heated rooms or on plates of hot iron. It requires not less than 70,000 of them to weigh a pound.

Occasionally a bug distemper breaks out and devastates entire plantations—as in Guatemala a few years ago, when the *hacendados* were obliged to clear out the old stock, root and branch, and begin anew. The coccus are also fed upon by birds, mice and the larvae of other insects—the last-named destroyers' sneaking out the body and leaving only the empty skins.

The high price of cochineal has led to the substitution of other articles for dyeing, lac, madder and aniline having superseded the coccus to a great extent. Various articles are used in the adulteration of cochineal, and "the tricks of the trade" rival the Yankee pine ham, sawdust ginger and wooden nutmeg industry. Powdered tale, or carbonate of lead, tied in a bag and shaken with the insects, adheres to their wrinkled bodies and greatly increases their weight. Grains of a substance prepared from clay or colored dough, have been manufactured by enterprising Frenchmen to precisely imitate coccus, and palmed off upon an unsuspecting public. Millions of pounds of easy and bonbons are annually colored with these powdered insects—a not very appetizing thought when the facts are considered!

Fannie B. Ward in the "Times."

Rural Life.

COUNTRY LIFE.

ITS SUBTLE CHARMS.

I have found my rural felicity not a little heightened, not only in summer but in winter, by picturing to myself what people are doing in the city at any given time. For instance, it is about five o'clock of a December day. My possible self is hurrying up-town after a day of office-work, for the purpose of donning a neck-tie and a flowing shirt-front and screwing myself into a dress coat, preparatory to a dinner-party, where I shall be cornered for hours between mental insipidity and physical dyspepsia. Or, I sally forth from my own comfortable board and fire-place to pay my social debts in a round of utterly barren calls. Or I figure on the platform of some decorous and dreary public meeting, or sit like an owl on a committee or Board, or respond to some card of invitation to look at Solomon Smart's last achievement. Whereas now, apart from the whirl alike of Wall Street and the Avenue, the banquet and the bore, the gilded apeddom of the reception and tinsel of the play, I watch the sunset kindle on the mountains and tinge the snow of the lawn into a rose-color. And when the shadows have closed about me, I revive dear old Cowper's picture with Nineteenth Century improvements:

"Now stir the fire and close the shutters fast,
Let fall the curtains, wheel the sofa round.

So let us welcome peaceful evening in, . . .
And all the comforts that the lowly roof
Of undisturbed retirement and the hours
Of long, uninterrupted evening know."

One can really *read*, or better still be read to, on a winter evening in the country. Our literary range is not all *eram* and newspaper. Books which are books can be assimilated. "Classics" come to mean something more to us than a row of bibliothecal fetiches upon our shelves. "Reading aloud," though seemingly a slow process, is really a time-saving as well as labor-saving device, since each hour thus spent is to be multiplied by as many as the household group contains. Happy the man who has been fortunate enough, especially after a somewhat storm-tossed or sun-burnt life, to drift into some such eddy, ringed around with quiet mountains and green shores, where he can lie with furled sails and slowly dripping oars and see the white caps and hear the dull reverberation of the world's roar beyond. It is (to vary the metaphor) like standing under a porch on a rainy day, or in a Club-window when a procession passes.

ITS STERN REALITIES.

I have a wholesome and inspiring sense of reality in the country. I feel myself "close to Nature's heart." I have the "patterns in the mount," the antitypes of those things which make the grace and grandeur of cities. They have pictures, I have the landscape. My woods and rocks furnish the originals of their Gothic arches and Corinthian pillars, their stately arcades and colonnades and vistas. What are their frescoes and artistic decorations alongside of my skies and autumn foliage? All the stillness and softness and color and song which they contrive and create, which they fence off and hollow out from noisy streets and in the cave-like cen-

ter of stony and staring houses,—what is it all but the attempt to reproduce what comes to me unbidden on the most unstinted scale, poured over all my life, without money and without price?

And yet here comes in one of my *stern* realities. Country people are apt to be the last to understand that the beauty of the country is in its naturalness,—its sincerity, so to speak. Therefore the most thrifty region is not necessarily the most picturesque.

There is rather a disposition to be ashamed of poor, wild nature with its rustie, bare-foot, sunburnt charm. There is a mania to "slik up." Paint must take the place of the soft, rich pigments of lichen and weather-stain. Right angles must strike their discord into the gentle curves and tangled diversities of native form. A Vandal architecture drives out the Gothic. A man is famous as he lifts his axe upon the thick trees. Even the spired or trailing evergreens must be trimmed into grotesque and vulgar shapes. We need to learn the art of letting alone. The "smart" epoch of civilization is more savage than the barbarous. The first impulse of art is to destroy nature, to create a desert and call it culture. Later stages consist of efforts to get back to nature,—or rather, to revive its semblance. And that art which most nearly restores the old despised and crucified truth of nature comes to be recognized as the truest art.

The unhealthiness, if not the unconscious charlatanism, of Thoreau is well illustrated in his remark, "I love nature partly because she is not man." On the contrary, I love nature because it is man; or rather, because all nature becomes human as soon as man gets where he can see his face in it. Nothing marks the fineness of the Greek mind more than this detecting of a personal and spiritual element in the natural world, and its vital and mystic identification with man. Their personification of the elements and objects of the out-door world was no mere fancied resemblance or poetical conceit. It was the result of the highest imaginative insight, and of the most delicate and even religious feeling. As so charmingly expressed in the beautiful lines of Horatio Nelson Powers, they heard the

"Ecstatic rhapsodies that run
Along the bark that feels the sun,
The laugh with which the birds unfold,
The passion in the pollen's gold.
They heard the faint, delicious beat
In hearts of roses, converse sweet
In airs that toy at twilight's hour
With Apple-bloom and Orange-flower,
The anorons whispers of the grass
As skylarks brood and lreilles pass,
The dew's desire, and girls that make
The thunder's fiery heart-strings break.
To them were told the dreams that lie
Deep in the Lily's languid eye,
Legends that ferns and corals store,
In books of rock and ocean's floor,
The prayers that out of pastures cry
When scorched beneath a bronzen sky,
Strange syllables that from the ground
Speak like the naked soul of sound,
And all that birds in love relate
Of happy flight and tender mate,
And what the telos of insects tell
Of their incessant embrace."

SUMMING UP.

The subtle charm of living in the country may be summed up in a word or two. It is the revival in our "embers" of something "that nature still remembers,"—of a wild, open-air, primitive existence when man was

on a footing, both as friend and foe, with the animal tribes, and rooted like the plants in his mother earth. We are twin-births, every one of us. A red and hirsute Esau contends with the smooth Jacob of civilization. He is sure to get worsted in the end; but he is not dead, and will ever and anon muster his Bedouin forces for an onslaught upon the household gods and the sleek prosperity of his rival. Evolution at times has to give way to revolution. Hence the town is ever overflowing its dykes, and spreading itself over the fields. The child's vacation at grandfather's farm, the weary clerk's week or fortnight out of the store or office, the emptying of all the brown-stone fronts in summer, the tribulations of "country board," the concourse around a bit of grass or a spouting fountain in a city square, even the rowdy excursion on a Sunday steamboat, are all forays of the gentle or ungentle savage within us in search of the hunting-grounds of a dimly remembered past. We are always coasting along a primal continent of Palms and painted Indians, whose wafted odors we faintly catch and whose drifted blossoms cross our path till the crew, unmindful of worldly-wise old Ulysses, are crazy to go ashore.

And so we go into the country. And if we be truly inspired with the "primal sympathy," we shall find in every sight and sound and smell a soothing and a suggestion, which meet a deeper need than that of the senses. In the green pastures and beside the still waters He restoreth my soul.—Dr. F. N. Zabriskie in *Christian Intelligencer*.

HEALTHY HOUSES.

Houses and cottages in the country as well as in towns are frequently so ill constructed, says Dr. J. Sinclair in *Laws of Life*, that instead of being healthy abodes they are really traps for catching disease.

Among the sanitary arrangements which should be attended to, the following are of vital importance:—That the surroundings of the house are free from anything likely to give rise to bad smells. That there is a hall or porch, so that the door of the sitting-room does not open directly to the weather outside. The want of this protection is for half the year a certain cause of injurious draughts and absence of comfort. That the windows of every room open at the top. That there are drains for conveying away slop-water. These should be trapped outside. If there is a sink pipe inside, this should never be continuous with the drain, but open some inches above the outside trap. This interruption prevents sewer gases entering the house through the sink pipe.

Privies with cesspools, on the old-fashioned plan, are always a nuisance, and are only to be tolerated when well away from the house, the cesspool small, and used only as an ash pit. All dry refuse should daily be thrown in, and the contents kept dry. A valuable manure can be thus formed. Where houses are crowded together, particularly among the laboring classes, the privy cesspool should be done away with as a nuisance and injurious to health. If it is not expedient to have water-closets, then a dry earth system should be adopted, provision being made for the regular removal of the palls. This essential part of dry earth systems can only be properly carried out by the local authorities.

Exhibitions & Societies.

AMERICAN HORTICULTURAL SOCIETY.

The executive committee has decided to change the meetings of the society from annual to biennial, alternately with the meetings of the American Pomological Society. It was also decided to change the time of meeting from January to September. The next meeting of the society will be held at Cleveland, Ohio.

MISSOURI HORTICULTURAL SOCIETY.

This society will hold its twenty-eighth annual meeting at Warrensburg, Dec. 9-11, '85. It is expected to be one of the best meetings ever held, and as many members as possible should be there. Reduced rates on the railroads, free entertainment, a good programme, and a display of fruits are some of the features.

NEW JERSEY STATE HORTICULTURAL SOCIETY.

The annual meeting of this society will be held in the Court House at Trenton, during the last week of December. The programme has not been received at this date, but we are informed that strenuous efforts are being made to make this one of the most interesting and useful meetings of the kind ever held in the State.

MICHIGAN STATE HORTICULTURAL SOCIETY.

The annual meeting of the Michigan Horticultural Society will convene in Benton Harbor, December 1, 2 and 3, with the Berrien County Horticultural Society. Delegates will be entertained by members of the local society and everything will be done to make this a notable event in the history of Michigan fruit culture.

The programme of topics for discussion is full and varied, and is so arranged that each session will be devoted to the discussion of one special branch of horticulture, namely: Market Fruit Growing, The Vegetable Garden, Ornamental Horticulture, Amateur Fruit Growing, Arboriculture. This is an excellent plan, worthy of imitation by other societies; it facilitates work, and prevents the rambling character which discussions on such occasions often take.

In connection with the meeting there will be an exhibition of fruits, vegetables, flowers, etc. Railroad certificates,—at reduced rates,—and further information may be obtained from Secretary Chas. W. Garfield, Grand Rapids, Mich.

NEW YORK'S CHRYSANTHEMUM SHOWS.

The intensity of the Chrysanthemum craze in New York has been so great that it seems hardly possible that it can be of long duration, and yet has already continued and increased for three years. The great strength of the Chrysanthemum,—without regard to its intrinsic merit,—lies in the season of its blooming, at a time when it actually has not competition from out-door flowering plants. Yet, on the other hand, it is so easily grown and propagated that the flowers have become as abundant and cheap as field Daisies in summer, so that commercial florists do not find it profitable any more to handle them, and consequently are not anxious to encourage a fashion which results

in their loss. However near or far off its day of doom may be, the improvements which have been accomplished in Chrysanthemum flowers, and the stimulus that has been given to floricultural taste in this city are of incalculable value, and their beneficial influence will remain, even after the fashion of the day has faded away.

NEW YORK HORTICULTURAL SOCIETY.

For the first time Horticultural Hall was taxed beyond its capacity, so that the basement of the large building had to be cleared and made accessory to the grand Chrysanthemum Exhibition held November 5th, 6th, and 7th.

The main hall was devoted exclusively to potted plants, while the cut flowers were accommodated in the lower floor. To one not versed in the intricacies of Chrysanthemum variations, the sight must have been bewildering, and from the expressions of delight and wonderment heard from most visitors, to many of them the show must have appeared a kind of revelation.

The standards were principally arranged on the rear platform so as to present a very ocean of blaze and color, the whole producing a grand effect. The height of the stems of the standards varied from two to five feet, the tallest specimens being in all eight feet high, but those of five to six feet produced a more pleasing effect. An odd-looking innovation were the grafted standards raised by John Farrell, gardener to Wm. Barr. From four to six different varieties each of a distinct color had been grafted upon one stem, very much like different varieties of Apples or Pears may be grafted upon one tree. These singular-looking specimens, of which there were a dozen or more, attracted perhaps more attention than anything else in the hall, and to those who have limited space and yet wish to grow many varieties, the plan recommends itself.

The bush plants were generally remarkably well grown, of an average height of three to four feet and some over three feet in diameter. John Thorpe's seedling "President Cleveland," a beautiful white variety, was a magnificent specimen; it had nearly 400 flowers open at the time, and was sent to Washington and presented to the president, who was well pleased with the gift. "Mrs. R. Brett," deep golden, was another notably fine specimen plant.

But, beautiful as the pot plants were, the glory of the exhibition was in the cut flowers. A Chrysanthemum flower of seven inches in diameter may seem an impossibility to many of our readers,—it seemed so to us previous to this exhibition,—but here they were, by actual measurement; flowers of six inches in diameter could be counted by the hundreds, perhaps thousands. It was a sight to be remembered, these rows upon rows of mammoth flowers, and yet, we fear, the exhibition of such artificially produced flowers may cause no small degree of disappointment to visitors who copied the names of the varieties expecting to raise like flowers by simply planting the variety. In order to produce such large flowers only a few der to produce such large flowers only a few flowers or only the terminal ones are allowed on the branches, all the lower buds being broken out; thus by concentrating all the nourishment of a branch into one flower its size increases to comparatively enormous

dimensions. Yet the process is not difficult, and may be practiced by any amateur, and although the number of flowers is reduced, the actual amount of color on a plant and its effect is not diminished. The flowers from E. M. Allen, Woodbridge, N. J., which were the finest and most meritorious ones of all, were grown entirely out-of-doors, without any protection whatever except a canvas covering during a few frosty nights.

The best twelve Japanese were: J. D. Childs, Mad. Lueraux, Fulton, *Striata persecta*, F. Delaux, Blancheé Neige, Soleil Levant, President Arthur, Mad. Moynet, *Gloriosum*, Mrs. Brett, Dan. Allen. The best six Japanese of one variety were Mrs. Brett. The best twelve Chinese were Jardin des Plantes, Cambridge, Mabel Ward, Mrs. M. Morgan, Prince Alfred, Empress of India, Lady St. Clair, Lord Wolseley, Duchess of Connaught, B. Finlay, Fingal, Golden Empress. Six flowers of the latter were the best six of one variety. Among the Anemone-flowered were some of the most perfect flowers on exhibition; the prize collection of twelve consisted of: Mad. Cabral, Gluck, Margaret d'Anjou, Lady Margaret, Timbale d'argent, Mad. Theresa Closs, Fabius de Medina, Fair Margaret, Acquisition, Sœur de Seville, George Sands, and the Manhattan.

Of new seedlings there was a large array, some of them distinct enough to find a permanent place on the lists, but when it is considered that nearly 700 varieties were here exhibited, distinct novelties must naturally become scarce in time.

By far the largest exhibitors were Hallock & Thorpe, to whom were awarded nearly all the first prizes in the professional class. Among other prominent exhibitors were Siebrecht & Wadley, John Lewis Childs and Walter Coles.

The extent and excellence of the amateur exhibits was one of the most noteworthy features of the "Show." The principal exhibitors and prize takers in this class were: Rich. Brett, gardener to J. R. Pitcher, Short Hills, N. J.; John Farrell, gardener to Wm. Barr, Orange, N. J.; Geo. Matthews, gardener to J. M. Sugden, Great Neck, L. I.; John Cullen, E. M. Allen, John Dallas, Mrs. T. Schuster, L. Lord, Jr., G. O. Rawson, and others whose names we did not learn.

AMERICAN INSTITUTE.

This exhibition, held from Nov. 17th to 21st, was, naturally, in many respects a repetition of the above, as the principal exhibitors were the same on both occasions; in the general arrangement and disposition of the exhibits, however, it was decidedly superior. The large, well-lighted hall admitted of showing everything to better advantage, and the various classes could be kept well separated, which facilitates the work of the judges considerably. The number of new seedlings exhibited was large; Annie Brett, Mrs. J. Thorpe, Jennie Murkland, Bronze Shield, and others, being especially noteworthy.

Designs of cut flowers, as is usual at these exhibitions, were well represented, and most of them were tasteful and pleasing. Baskets, vases, jardinières, etc., were filled and gracefully arranged with Chrysanthemums in combination with Feathery Asparagus and various autumn-tinted leaves.

THE BOSTON CHRYSANTHEMUM SHOW.

Special Correspondence of The American Garden.

The Annual Exhibition of Chrysanthemums by the Massachusetts Horticultural Society on the 12th and 13th of November, was in many respects the most successful ever given in Boston, and that is saying a great deal, as these Exhibitions have taken place for years, and do not depend upon a mere fanciful craze among society people for their popularity or completeness. The horticultural taste in Boston is too deep and sincere to be eddied here and there by the whims of fashion, and that is the reason for the unvarying progress and popularity of the Boston Flower Shows. Over ten thousand people attended this Exhibition, and had it been kept open another day, not less than fifteen thousand would have attended. Some of the principal growers did not exhibit, owing to various vicissitudes, among them Marshall P. Wilder and C. M. Atkinson. Last year the latter showed some of the most remarkable specimens of single-stem Chrysanthemums ever shown in this country, and it was regretted that he could not compete this year.

The upper hall of the society, comprising 5,000 square feet, was devoted to Chrysanthemums in pots and the Orchid display, while the lower hall was given over to cut blooms, and fruit and vegetables. Even both of these large halls were inadequate to hold the various collections. The first prize for the six Chinese Chrysanthemums, was taken by Dr. H. P. Walcott of Cambridge, with the following varieties: Mrs. Forsyth, Bruce Finlay, Baron Buest, King of Crimsons, Mrs. Sharp and Mrs. Shipman. These were magnificent plants in 12-inch pots, grown naturally, the blooms not tied down, each plant between four and five feet high and averaging five feet across. The same may be said of all this grower's plants, who offered some thirty specimens, which were admitted to be the best grown plants ever shown in one lot in this country.

Dr. Walcott was also first for three Chinese: Mrs. Dixon, Christine and Alfred Salter. He was also first for six Japanese with glorious plants of La Charmoise, Flambeaux, Nevada, Bouquet Fait, Golden Dragon and President Parkman. For three Japanese, Dr. Walcott came first with Fair Maid of Guernsey, Moussillac and Belle Valantinan.

For four Pompons, Dr. Walcott was first with Salomon, La Vogne, Mollie Marthe and Golden Mlle Marthe. The specimen Chinese Chrysanthemum, Gladstone, offered by Dr. Walcott, took the first prize, and the latter took first prize for specimen Japanese Chrysanthemum with Fernand Feral. Dr. Walcott's only competitor in these classes was a new grower, Mr. Edwin Fewkes of Newton, whose plants while smaller, were yet well grown and very clean and perfectly flowered. He took all the second prizes for specimens.

The first prize for forty specimens, not less than ten varieties, was awarded to E. W. Wood, who showed handsome plants of the following: Anais, Bouquet Fait, Citronella, Dainio, Dr. Sharpe, Elaine, Fremy, Fair Maid of Guernsey, Golden Circle, Golden Geo. Glenny, Golden Dragon, Gray's Golden, Beverly, Mabel Ward, Jno. Salter, Madame

B. Rendatler, M. Planehinan, Mrs. Geo. Glenny, Mrs. Geo. Rundle, Prince Alfred, Prince of Wales, Semiramis, Snowball, Souvenir de Mercedes, Seur Melanie, Temple of Solomon and White Eve.

Edwin Fewkes was second in this class and Patrick Malley third.

The display of cut blooms was very large, and hundreds of seedlings were shown. It is evident that while the tendency to grow these is laudable and should be encouraged, that on the other hand there is a tendency to flood the field with varieties which are not distinct or remarkable; many named kinds have been placed in commerce, which a year hence will be thrown aside by growers as worthless. Standing out in marked distinction with the average run of seedlings, was

A magnificent, white, reflexed flower shown by Dr. Walcott. This, which was labeled C. 10., was considered the finest white seedling ever shown in Boston or anywhere else. It is a perfectly-shaped, globular flower, with firm, strap-shaped petals of such pure color that Elaine looks dusky beside it. The petals reflex in such a way that the flower appears to be globular and the center is filled to perfection. The specimen on exhibition measured over four inches across. It was awarded a first-class certificate of merit and was stolen on the last night of the Exhibition by some one who no doubt hoped to propagate it from the stem. Dr. Walcott showed blooms of other fine seedlings, notably a yellow and a pink Japanese flower, both very large and promising. A silver medal was awarded Dr. Walcott for an immense plant of his seedling B. 25. This is a small reflexed flower of vigorous habit but whose chief charm is its intense dark yellow color. It is quite distinct in this respect and will prove a valuable acquisition. Other fine seedlings of Dr. Walcott's, viz: Geo. Walcott, lilac striped; Colorado Yellow and Algonquin Yellow were shown and generally admired.

Mr. Fewkes exhibited a group of seedlings, all of good form and color. A large group of seedlings was shown by Patten & Co. of Salem, most of them inclining to be open-eyed, but noticeable for the varying forms and colors which were pleasing. J. Lewis Childs showed a good group of cut blooms and E. M. Allen exhibited a bronze yellow seedling called Brazen Shield.

In the competition for cut blooms Edwin Fewkes was first with twelve blooms of Chinese Chrysanthemums. This was a very perfect lot and were named Isabella Bott, Rival Little Harry, Princess Teek, Barbara, Hereward, Eve, Mr. Corbay, Mabel Ward, St. Patrick, Nil desperandum, Lady Hane and Mr. Bunn. He was also first for six blooms of Chinese, as follows: Lord Wolseley, Guernsey Nugget, Pietro Diaz, Princess of Wales, Mrs. Forsyth, General Slade.

E. Shepard of Lowell showed twelve cut blooms of Japanese Chrysanthemums, and took the first prize in this class. The first prize for twenty-four sprigs of Japanese blooms went to Edwin Fewkes for unexampled specimens of Souvenir de Hamlet, Carmen, Gloire de Toulouse, Album plenum, La Frizure, Dalmio, Fulton, President Parkman, Ben d'Or, Beaute de Toulouse, Source d'Or, Bouquet fait, Dr. Musters, L.

Incomparable, Baron de Prailly, Moonlight, Flambeau, Oraele, Bouce d'Or, Aurore Boreale, Mme. C. Andiguer, M. Paul Fabre, Gloire Rayonnante, Margot.

Mr. Fewkes took first for twenty-four sprays of Chinese, as follows: Faust, Jardin des Plantes, Princess Teek, Talford Salter, Souvenir Mercedes, President Sanderson, General Slade, Garden Queen, Antoinette, Isabella Bott, Hero of Stoke Newington, Cherub, Hereward, Mr. Bunn, Barbara, Venus, Mr. Corbay, Eve, Jeanne d'Are, Mrs. Forsythe, Rival Little Harry, Mrs. Dixon, Mr. George Glenny, Mabel Ward. Mr. Fewkes was first for six blooms of Japanese: Baron de Prailly, Soleil Levant, J. Delaux, Belle Paule, Chinoiseire, Mrs. C. Cary.

As is always the case the display of Orchids was large, and crowds surrounded the stage, which was filled with splendid specimens. Fred L. Ames took first prize for three Orchids, showing *Cypripedium insigne Maulei*, with some eighteen flowers: *Odontoglossum Alexandrae* and *Vanda Sanderiana*, the latter having a spike of seven highly-colored flowers. E. W. Gilmore was second with *Oncidium Ornithorhynchum*, three feet across, *Odontoglossum grande* and a fine specimen of *Sarcobolium Blumei majus*. The third prize for three Orchids was won by F. L. Ames with *Vanda cerulea*, *Phalenopsis amabilis* and *Cypripedium Opicintanum*, the latter with about fifteen flowers open. E. W. Gilmore was fourth with *Dendrobium formosum giganteum*, *Oncidium variosum* and the *Lycaste Skinneri*.

David Allan took the first prize for a specimen Orchid with *Vanda cerulea*, the blue-flowered *Vanda* bearing two fine spikes. F. L. Ames was second with a glorious specimen of *Cypripedium Harrisonianum*. W. A. Manda of the Cambridge Botanic Garden had a fine lot of Orchids and rare greenhouse and hardy plants. Mr. Ames exhibited for the first time *C. tessatum porphyreum*, a fine hybrid, and *C. Tonson*, a species. Both are striking Orchids and received a certificate of merit. There were many other rare Orchids on the stage, the whole producing a floral *tout ensemble*, which cannot easily be described. There were brilliant collections of cut flowers from many other exhibitors which in this limited report cannot well be alluded to in detail.

The fruit display was large and especially good as to Pears. Among the latter were Angonemes, Anjous, Langeliers, Lawrencees, Vicars and Winter Nelises. J. P. Knight exhibited Japanese Pears and two seedlings from the same. One of the latter was remarkably beautiful. A dish of *Psidium* (Guava), which is rarely seen, was shown by Mrs. F. B. Hayes.

The society has just appropriated \$5,800 for prizes for the year 1886, and its exhibitions for that year are likely to be larger than ever. A not unlikely probability is, that within a year the society will secure a lot of land on the Back Bay district and erect a light building for large exhibitions, having from ten to fifteen thousand square feet all on one level. When it is stated that the yearly receipts of the society for admissions to its four great exhibitions have grown from about \$600 in 1882 to over \$3,600 in 1885, the necessity for increased accommodations will be appreciated.

Gardening is the most beautiful, the most healthful and most enjoyable employment for man or woman, for youth or old age.

SUB ROSA.

Now don't you think, just between ourselves, that it is all hypocritical nonsense for after dinner speakers and dilettante writers to be so constantly praising us soil and plant workers as chief among all toilers with hands, and lauding our occupation to the skies as noble and grand? Have you noticed that most of those folks who talk so grandiloquently about cultivators of the soil very rarely are farmers or gardeners themselves? They think it all very nice for other folks—but not for themselves. Some old philosopher said we should mistrust the motives of flatterers, and we guess it is true today. Honest praise is scarce. The world thinks we need none for doing our duty quietly, though it often helps a weary worker wonderfully.

Another sort of talk that does little good is the carping criticism of every new thing and new method. We will tell you, confidentially, that we think it mighty poor policy for editors to deride new varieties of fruits and garden plants, simply on their own experience. "This is a big country," and a thing may be good in New York and worthless in Georgia. It caters to the lower feelings of men to be forever trying to prove a merchant a cheat and fraud because a few seeds or plants are not just what was expected. Mistakes happen to everybody. The most successful men—business men, statesmen, philosophers—are those who have confidence in their fellows until they prove themselves unworthy of confidence.

Gentle Flora is holding high carnival in America as never before. The ranks of her devotees are swelling apace. Fashion bows low at Flora's nod, and wears her favors as rarest finery. No feast or fête is of any moment without freest decoration of flowers and rare plants. The exhibitions of the beautiful products of garden and greenhouse were never so large or so fully attended as this year. The fair Chrysanthemum alone now claims admiration for more than half a thousand varieties. Flora is lavish with her gifts to the poor and the rich alike. But poor folk get these delights by their own willing labors, while the rich are paying princely prices for the rare and costly beauties. The gentle goddess demands close and loving service, and she is now receiving it unstintingly from dames and maidens and stalwart men. Her gracious rule is spreading through the homes of the land, through the halls of fashion and the salons of art. May her banners wave at every window, and on every lawn, and her banner bearers be all who are fair or true.

Fair Pomona, too, is rejoicing in the rapid extension of her kingdom over the gardens and farms of the land. There are many indications that fruit culture is making

rapid strides as an industry in all parts of the country. Men of brains and experience and desire for progress are forming themselves into associations for the promotion of their work, and the old societies were never more useful than now. The recent exhibitions have been remarkably complete and useful. New varieties of great merit are being constantly introduced which will increase the returns of cultivation. This year has seen marked progress in varieties and methods, and general enlightenment on the importance and possibilities of horticulture. The fruit growers and gardener occupy foremost places among the industries of the soil, and are determined to keep there if organization and the spread of knowledge can accomplish the object.

Horticultural journals which claim to be "the only paper of its kind published" are expected of course to be exceptionally original in their various features. But isn't the claim rather far-fetched, dear friends, when you copy department headings, manner of arrangement, and the new features of THE AMERICAN GARDEN as fast as they appear? We don't object to your doing this, for we work for the good of horticulture, and if you can work any more effectively on our plans and methods, you are welcome to do so, but wouldn't it be more modest to claim less of pure originality?

Women gardeners were hard to find only a little while ago, but as we search for them diligently they come forward in ever increasing numbers, yet with the imate modesty of their sex, a charming trait that work in the art-beautiful administers to and cultivates. We mean of course the women who engage in gardening as a business, and the number is all too few. No employment is better fitted for woman than this, and none can more appeal to her love of the beautiful; none is better adapted to her strength; none is more in accord with her natural abilities; none is better for her health. We now have in hand several examples of remarkable successes of women in horticulture, which we promise to give our readers in due time. But please remember that this is sub rosa, and don't say anything about it!

Do you know of any better work in the world than the promotion of the culture of fine fruit, healthful vegetables and beautiful flowers? If you do, please tell us what it is, for we want to engage in that work. But if you love gardening or fruit culture in any form, why not seek to interest your friends in the pleasant employment for your leisure hours, if not as an industry? And if you do this, how can you do it better or more effectively than by inducing them to read horticultural books and periodicals? Surely the paper or magazine you read has done you much good, if only in keeping you informed on the progress of the art you love. The man or woman who does not so read has much to learn about the methods of work as well as of what others are doing, and to him or her the periodical may be of most use in helping to properly direct their efforts either for pleasure, health or profit. Isn't this good sense? and won't you act

upon the suggestion to-day and to-morrow, but especially to-day among your neighbors?

Surprised was the worthy editor of *Vick's Magazine* at our caption of "\$500 to \$1,000 profit" on an acre of land. Why "surprised?" Any horticultural editor who has travelled among the class he aspires to lead and instruct should know of many instances of these large profits. We do. If Mr. Seelye will read our October and November and following issues carefully he will see definite and accurate records of these large profits. Of course we don't pretend that every gardener makes such profits. O no. More's the pity. We don't make them yet but are trying to. We claim that some skillful cultivators do achieve such results, and that many more can if they try *rightly*, and we shall help our readers to this desirable end of large profits.

Try new things. "Prove all things and choose that which is good"—to the extent of your means and ability, but don't be humbugged with the pretended "novelties" of unreliable parties. Fortunately, most of the leading seedsmen, florists and nurserymen now exercise extreme care in the introduction of new varieties. The reliable nurserymen, under the lead of the American Pomological Society, have had excellent success in this direction, and the best seedsmen are doing the same. There will be surprise and consternation among some pretended seedsmen when they see certain catalogues this year, at the way in which some of the claimed "novelties" are shown up by giving their true names. May the good work of giving rightful names prosper greatly.

Apples are so plenty in Western Massachusetts that on a recent drive in Franklin county we saw hundreds of bushels of fine fruit going to waste in many orchards for want of interested hands to garner them. This is rank injustice to the Apples, for, with prices at \$2.25 to \$5.00 a barrel in England, there is no necessity for such wastefulness. There is demand enough for them, if their owners would stir themselves to find it. Such men don't deserve good fruit. If the market is far off and difficult to reach, there is no good reason why the fruit may not be turned into cider and vinegar through a cider mill or vinegar factory. No such establishment exists in the vicinity we write of, but one might find profitable employment there in nearly every year.

Oh! A youthful contemporary, which is very bright and interesting, says: "You can rarely buy as good Tomato seeds as you can save at home." We believe in saving seeds at home. We even grow a few varieties of seeds for sale to seedsmen, because we have learned how by years of dearly bought experience. But we buy all other seeds than these few sorts of men whom we believe know how to grow them better than we can. And we always buy the highest priced seeds, never the cheap ones. The best of everything is none too good. We would as soon think of trying to raise our fruit trees, as of saving seed for our own use. Every man to his trade.

MORE LARGE PROFITS.

How \$1,492.32 net profits per acre were made
BY THEO. F. BAKER.

President N. J. State Horticultural Society.

Noticing that the correctness of the statement of THE AMERICAN GARDEN that from \$500 to \$1,000 profit per acre could be made in gardening, has been questioned by certain parties, I wish to endorse the "GARDEN'S" statement most emphatically, and am ready to furnish convincing proof thereof. Such profits are, of course, not claimed, nor can they be produced, from every acre of a large farm; market gardeners do not generally measure their gardens by the hundred acres; but cultivate their choicest lands in small plats according to the demands of the markets. With judicious management, application of the proper elements for plant food, and thorough cultivation with hands and brains, market gardening can and does produce crops that will net a profit of even more than the sums named by THE AMERICAN GARDEN, as will be seen by the account below of the expenses and receipts from one-eighth acre cultivated this year.

Cr.—First Crop.		
4163 bun. of Onions at 3c per bun.		\$124.89

The ground has been under cultivation with Onions and Lettuce as a first or early crop for the last ten years in succession, and always followed by a second crop, varying as much as possible in its habit of growth and demand in plant food from the first crops. As good crops are now grown as when first cultivated, and the soil has become deep and rich.

The plat was plowed in November, 1884, and the manure applied spread evenly over the plowed surface. In the spring, March 31, plowed again turning under the manure and 400 pounds of Mapes Potato Fertilizer, applied broadcast and harrowed in with an Acme harrow, then Onion sets were planted

on part, and Lettuce to finish the plot. After these crops were gathered and the ground cleared, July 2d, it was again plowed and harrowed and Cauliflower and Peppers planted two feet, six inches apart each way, without any manure or fertilizer.

The Onions were pulled while green and sold with tops on—six in a bunch. All the produce was sold wholesale in the market.

The yield of some of the crops was considerably reduced by a severe drought which proved especially disastrous to the second plantings. Over one-half of the Pepper and Cauliflower plants were lost after planting, being burnt in the hot, dry soil, during the week when the thermometer registered from 96° to 100° every day. Otherwise the returns would have been still better, but as this record is simply intended to show what can be done in ordinary seasons and for a series of years, it may serve the purpose as well.

I may add that the figures here given are not mere guess work, but that I keep a day book,—and have done so for years,—in which each day's sales, expenditures, and operations are noted as they occur. By this means I can sum up my accounts at any time and ascertain the profit or loss of any crop. This habit of keeping accurate accounts—acquired in former mercantile occupation—has been of great help and advantage to me; it should form part of every farmer's and gardener's work, and, if conscientiously adhered to, would bring encouragement and profits to many a disconsolate tiller of the soil who does not know how to make ends meet. THEO. F. BAKER.

Bridgeton, N. J.

Answers to Correspondents.

Spreading Manure in Winter.—L. M., Elyria, O. —Fresh manure may be spread on the frozen ground with very little risk of loss, yet most gardeners prefer to compost manures, spread in spring, and plow under at once.

Pansies.—Rockland.—Pansies are nearly hardy in this latitude, but to insure their surviving severe winters, they should be covered similarly to the method advised for Strawberries. Where a cold-frame can be placed over them, flowers may be had nearly all winter.

Floral Designs.—Mrs. C. H. W., Hinsdale, N. H. —Fashions in designs, and styles of arranging flowers are about as capricious as fashions in millinery goods. Natural good taste is of more importance in arranging flowers than formal directions. The "Flower Fashion" articles in THE AMERICAN GARDEN give the fullest and most complete record of the flower styles in vogue in New York, to be found anywhere.

Potting Bulbs.—N. T. L., Astoria, N. Y. —Large bulbs growing in a greenhouse in winter do fully as well when one-third or one-half of the upper part is above the surface of the soil, as when entirely under ground. Bulbs potted in the fall, and not desired to bloom before spring, keep excellently in a cool cellar. They should be covered with sand or leaves, but if the cellar is warm, the bulbs are apt to start into growth before wanted, in which case a cold-frame is preferable.

THE VACATION FORCE IN APPLES.—"My little boy," said a gentleman, "you ought not to eat those green Apples. They are not good for little boys."

"They ain't, eh?" the boy replied with his mouth full. "Guess you don't know much about 'em, Mister. Three of those Apples'll keep me out of school for a week." —N. Y. Times.

NOVELTIES.

Under this heading we propose to notice all new varieties of Fruits, Vegetables, Flowers, and Ornamental Shrubs and Trees introduced by reliable houses here and abroad. We wish to have it distinctly understood, however, that the fact of a novelty being mentioned here does not imply our endorsement or recommendation of the same, the descriptions being mostly those of the originators or introducers. This column is intended merely to serve as a record of the novelties of the day.

FRUITS.

Pear.—"Mahoning," M. Milton, Youngstown, O. Resembles Fred Clapp, but is much larger and better flavored. A thrifty grower.

Apple.—"Thompson," also "Hurst." Hybrid Crabs originated by Geo. P. Peffer, Pewaukee, Wis. Very desirable for the Northwestern States and Canada.

Strawberry.—"Needle's Seedling," originated in Iowa; similar to Wilson, but earlier and more uniform in size.

Grape.—"Marsala," originated in Missouri, and described by Sam. Miller as, bunch large, berry large, dark red, somewhat pulpy, with little native aroma but pleasant to eat; free from rot.

VEGETABLES.

Tomato.—"Livingston's Beauty." A. W. Livingston's Sons, Columbus, O. Claimed to be superior to any of the originator's former introductions.

Salsify.—"Mammoth Sandwich Island," Jas. M. Thorburn & Co., New York. Enormous size, resembling a good-sized Parsnip.

Potato.—"The Thorburn," Jas. M. Thorburn & Co., New York. Earlier and more productive than the Beauty of Hebron of which it is a self seedling.

FLOWERS.

Phlox Drummondii grandiflora stellata splendens.—E. Benary, Erfurt, Germany. Flowers vivid crimson, with a clearly defined white star in the center.

Kniphofia Leichtlini.—A new species from Abyssinia. A dwarf grower, bears a dense spike of yellow flowers, some four inches in length. Hardy at Kew.

Nelumbium speciosum album, or White Lotus. From Japan; flowers nine to ten inches in diameter and of ivory whiteness.

Iris Korolkowi from Asia. Not entirely new to botanists, but new in cultivation; described as in some respects the most beautiful of all Irises; of soft, creamy ground color with rich, dark purple-brown throat.

Fallota purpurea magnifica.—New Plant and Bulb Co., Colchester, England. Plant considerably stronger than the ordinary kind, flowers larger, of bright, clear scarlet, while the interior of the tube is white.

Eucharis Mastersi.—W. Bull, Chelsea, England. A newly-introduced species, flowers snowy white, produced in clusters from five to nine on each stem, very floriferous.

The following plants received first-class certificates of the Royal Horticultural Society of England: *Cutleya autumnalis*, J. Vetch & Son; *Calanthe Cooksoni*, Norman Cookson, Wylam-on-Tyne; *Sarracenia Buchananii*, B. S. Williams, Upper Holloway; *Calanthe Alexanderi*, Norman Cookson; *Nepenthes excoisior*, B. S. Williams; *Chrysanthemum Val d'Andorre*, Mr. Wright, Middle Temple Gardens; *Cymbidium elegans*, B. S. Williams.

ORNAMENTAL TREES.

Evergreens.—*Abies lasiocarpa*, Donnetti, Remonti, excelsa aurea; *Thuopsis nana compacta*, J. Butterton, Hammondon, N. J. All of them beautiful and desirable trees for ornamental planting; hardy.

Our friend Mr. C. V. Mapes has a bright boy fond of flowers, to whom he carried home a package of fertilizer for the boy's plants. On their way to the garden, the boy, with the parcel under his arm, said, as his perfume greeted his senses, "Papa, I wonder why the lovely flowers like this nasty stuff!" Of course, the fond papa then read the boy a lesson on the odd taste of the flowers for that particular brand!

METROPOLITAN MARKETS.

IN BRIEF PARAGRAPHS FOR THOSE COMMERCIALLY INCLINED.

A review of the month previous to November 16th.

FRUITS.

Apples.—King Apples have brought the best price until the last week, when Spitzenburgs have taken the lead, and are selling for from \$2.25 to \$3 a bbl. Kings are \$2.50 a bbl; Nonosuch are also \$2.50, Greenings cost from \$2 to \$2.50 and Baldpines \$1.25 to \$2. Lady Apples have put in an appearance, bringing 20 cts a qt and from \$3 to \$3.50 a bbl. Table Apples retail for 30 to 50 cts a doz.

Bananas.—Red Bananas cost \$1.25 a bunch and the yellow ones, which are usually lower in price than red ones, are \$1.50 a bunch, for a prime article. They cost 30 to 50 cts a doz retail.

Barberries are 50 cts $\frac{1}{2}$ pk.

Cocoanuts cost \$1.50 per 100; 10 cts each, retail.

Cranberries are 10 to 15 cts a qt; \$6 to \$8 a bbl.

Grapes.—Malagas vary so in quality that bbls of 70 to 90 lbs cost \$3 to \$7. They cost 20 to 35 cts a lb. Black Hamburgs are 75 cts to \$2 a lb, according to quality and the locality where purchased. All fruits bought on Broadway bring 25 per cent more. Niagara Grapes bring 75 cts per 5-lb baskets; Delawares are 60 cts for 5 lbs; Catawbas, 50 cts for 5 lbs; Tokays \$1.50 for 5 lbs; Concord 8 cts a pound.

Lemons.—Sorrento Lemons are just out of market. Messinas bring \$5 and \$6 a box. Malagas \$2 a box. At retail Lemons range from 20 to 30c doz.

Oranges.—Florida Oranges appeared the last week in October, but have been very poor and sour until within a few days, when an invoice arrived much improved in quality. They cost \$2.50 to \$2.75 a box. Jamaicas cost \$7 to \$8 a bbl. Messina Oranges are about done. A few Florida blood Oranges bring \$1 a doz in Broadway fruit-eries. The retail price of Oranges is from 40 to 60 cts a doz.

Peaches.—A late variety of California Peaches called "Billenius" were in market from October 20 to November 3. They were a flesh color with very rosy cheeks. They cost \$4 a box of 75, and sold for fancy prices on Broadway. There are a few Peaches from cold houses on the Hudson river bringing \$1 and \$1.50 a doz.

Pineapples.—There is a limited supply of Havana Pineapples at 40 cts each, and a few Porto Rico 25 cts each. The introduction of fresh Pineapples into mince-pie recipes keeps up a moderate demand for them.

Persimmons are 20 cts a qt.

Pomegranates cost \$4 a case of 100; or 5 and 10 cts each at retail.

Pears.—Seckels are 50 cts a qt in fruit stores. Virgalieres are 30 and 40 cts doz. Bosc are 50 cts a doz. Sheldons 40 cts doz. Duchess 50 cts a doz.

Quinces.—Only a few large, sound ones are seen; \$1.50 bush. Inferior Quinces are 75 cts a basket.

Tamarinds are 15 cts a lb.

Wintergreen Berries sell at 20 cts a qt.

VEGETABLES.

Artichokes.—French Artichokes are 30 cts each; Jerusalem Artichokes 35 cts a qt.

Beans.—Lima Beans have deteriorated in quality, and are scarce. They are sold in the pod for 10 cents a small measure, or shelled for 20 cts a qt. String Beans from Florida are 60 cts $\frac{1}{2}$ pk. Long Island String and Butter Beans are scarce at \$3 a bag, 25 cts a small measure.

Brussel's Sprouts bring \$4 a basket, 30 cts a qt.

Beets are 30 cts doz bunches, 5 cts a bunch.

Celery costs \$1.25 a doz bunches and 12 and 15 cts a bunch.

Corn.—Green Corn still lingers, but is not excellent; from 25 cts it is now 35 cts a doz ears. **Califlowers** are plentiful and cheap at 75 cts to \$2 a bbl, and are 15 to 30 cts each.

Carrots are 20 cts $\frac{1}{2}$ pk, and \$1.50 a bbl.

Cucumbers.—Hot-house Cucumbers are in market, costing 40 cts each.

Chervil from the hot-house is 10 cts a bunch.

Cresses are now sold by the qt. As they are from beds protected, they cost 20 cts per qt. When gathered from brook-sides in mild weather they are sold in small bunches.

Cabbages bring from \$1 to \$1.50 doz, and 10 and 15 cts each.

Dandelions are 10 cts a qt.

Eschallots are 40 cts a qt.

Egg Plants have been plentiful and cheap, but are about disappointing. Small ones are 15 cts each.

Fetticus is 10 cts a qt.

Lettuce is very fine; the choicest is 5 cts a bunch, and ordinary quality brings 50 cts a doz, 3 heads for 10 cts.

Mushrooms.—A glut of field Mushrooms came the last of October; they sold from 15 cts to 25 cts a qt; after a week of this, the supply fell off and prices went up to 50 cts a qt. There are now no field Mushrooms in market. Cultivated ones cost \$1.50 a lb.

Mint is 5 cts a bunch.

Okra.—Green Okra from the Bermudas is \$1 per 100. Dried Okra brings \$1 a lb.

Oyster Plant is \$1.25 and \$1.50 per doz bunches, and 20 and 22 cts a bunch.

Onions.—Spanish Onions in 60-lb crates cost \$1.50; 5 to 10 cts a lb at retail. Some from Valencia are extra large and mild; 7 cts a lb. Silver-skinned bring \$4 to \$6 a bbl; 60 cts $\frac{1}{2}$ pk. Red Onions are \$2.50 bbl; 30 cts $\frac{1}{2}$ pk.

Potatoes.—About half the crop of Western Potatoes have dry rot. Fine ones bring \$2.25 a bbl. Very few arrive from New Jersey and these sell for \$1.50 and \$1.75 a bbl. Long Islands cost \$2.25 a bbl; Nova Scotia, just arrived and considered the best, are \$2.50 a bbl.

Sweet Potatoes.—"The Nancy Marm" from Virginia rank Delawares and are \$2.50 bbl. There was a glut the first of the month, when they sold for \$2 bbl and 20 cts $\frac{1}{2}$ pk. They bring now 30 and 35 cts $\frac{1}{2}$ pk retail.

Parsnips cost 20 cts doz, and \$3 a bbl.

Peas.—New green Peas from Florida cost \$1 a pk retail. Long Island are poor and 30 cts $\frac{1}{2}$ pk.

Peppers.—Spanish Peppers cost 10 cts a lb.

Radishes are 5 cts a bunch.

Squash.—Hubbard Squashes are 10 and 20 cts each.

Turnips cost \$1.50 bbl and 20 cts $\frac{1}{2}$ pk.

FLOWERS.

Asparagus vine costs \$1 a spray or garland. At retail, \$1.50.

Carnations cost \$1 per 100 for all excepting fancy varieties, which bring \$2 per 100. The latter retail for 5 cts each.

Chrysanthemums cost 25 cts a bunch, wholesale, and sell for 30 cts a bunch. So little profit is made by retailers on this flower that they consider it time thrown away in handling them. Blooming plants bring from 30 cts to \$3.

Daphne costs 10 cts a spray, wholesale, and 15 cts retail.

Forget-me-not is 25 cts a doz sprays. It brings 5 cts a spray, retail.

Ilyacinth (Roman) is \$10 per 100 and 15 cts a spray, retail.

Heliotrope costs 25 cts a doz sprays and retails for 35 cts a doz.

Jasmine costs 25 cts a bunch of one doz sprays. Three sprays are sold for 10 cts, retail.

Lilac costs \$3 a plant, cut or on the bush. Fancy prices are charged at retail.

Lily of the Valley is \$8.00 per 100. It is 15 cts a spray, retail.

Mignonette cost 25 cts a doz, wholesale; 4 sprays bring 10 cts, retail.

Roses.—Perle des Jardins are \$5 per 100, as are Nipbetos, and Souvenir d'Hen Ami. Tea Roses cost \$2 per 100. A few Jacqueminots straggle in, cost \$2 per 100; these bring \$20 per blossoms forced on old wood; these bring \$20 per 100. The American Beauty Rose sells for from 100. The American Beauty Rose cost \$10 15 to 25 cts each, retail. Coruelia Cooks cost \$1 per 100. Bennett Roses bring \$8 per 100. La Franco Roses are \$18 per 100. Mermots are \$5 per 100. As a rule from 25 to 50 per cent is made by refellers of Roses; but it is difficult to give correct quotations of retail prices, as these are never standard.

Smilax is 25 cts a string, retailing for 30 cts.

Violets cost from \$1 to \$2 per 100. They retail for from \$1.50 to \$2.50 per 100.

Trade Notes.

ITEMS OF GENERAL INTEREST FROM THE SEED, NURSERY AND FLOWER TRADES ARE SOLICITED.

It is currently stated that the seed crops of Wrinkled Peas and of Beans and Onions are quite short.

A. J. Caywood & Sons, Marlboro, N. Y., have had a good trade this year. Their new varieties of Grapes and the Raspberry take well.

Mrs. E. L. Grant Campbell, the energetic woman florist of Cleveland, is arranging to add a wholesale branch for florists' supplies to her growing business.

Hovey & Co., 16 So. Market St., Boston, have not sold out to anybody, but keep up the old established business and have a large proportion of the very cream of the seed trade at their old stand.

E. Hppard, Youngstown, O., finds THE AMERICAN GARDEN so good an advertising medium that though he starts in for a series of advertisements, yet his stocks are not equal to the demand and he has to stop almost as soon as he begins.

A correspondent informs us that it was our old friend C. M. Hovey who first cultivated, exhibited and sold the Monarch Rhubarb in this country more than ten years ago, and was awarded the first prize by the Massachusetts Horticultural Society for its size and excellence over all others.

From present appearances the horticultural trades will seek to push their business the coming season by even more vigorous newspaper advertising than last year. One seedsman we know of, who decreased the size of his advertisements last year and spent less money than before, yet increased his business, will begin the next season early with large advertisements in only the best papers and magazines.

Hard times seem to have met nurserymen and florists during the year, but so far we have heard of very few business failures among them. Now affairs are looking brighter for them. Stocks are in good condition, and trade for the winter and spring promises to be fully up to the average of previous seasons, and in some lines much greater.

The nurserymen and seedsmen who are known for reliability, and who have acquired stocks of the best of the standard varieties which have been thoroughly tested, appear to be in fully as prosperous condition as those who spend much of their strength on so-called "novelties" that are little known. It is an interesting fact that the largest seed house in the world, the Vilmorins of Paris, refuse to offer a variety for sale until they have thoroughly tested it on their own grounds. The average quality of their seeds, too, is apparently not exceeded by those of any house in the trade.

SOME COMPETITORS

FOR THE AMERICAN GARDEN PRIZES.

The competitors entered to date for THE AMERICAN GARDEN Prizes are the following:

(1) *Grape*.—Name not given, by D. S. Marvin of Watertown, N. Y.

(2) *Strawberry*.—Jewel, by F. M. Augur of Middlefield, Conn.

Parker Earle, by Jno. T. Lovett of Little Silver, N. J.

No. 5 seedling, by J. G. Bubach of Princeton, Ill. Seedling, by J. A. Foote, Terre Haute, Ind.

"Itasen," seedling from the Manchester fertilized with Jersey Queen. By J. H. Haynes, Delphi, Ind.

(8) *For the best new Vegetable*.—Pea, a cross between Prince of Wales (female) and Poincain vert de St. Michael of Vilmorin, by E. S. Carman of River Edge, N. J.

Seedling. By M. A. Barber, Perry Center, N. Y. (4) *Gooseberry*, "Triumph." By George Achells, West Chester, Pa.

(3) *Raspberry*.—Name not given, a white cap, by D. S. Marvin of Watertown, N. Y.

"Earhart," black-cap, produced three full crops a year. By G. H. & J. H. Hale, So. Gastonbury, Ct.

(6) *For best New Fruit*, Red Huckleberry. By J. M. Ogle, Puyallup, Wash. Ter.

SAVORS OF THE SOIL.

HOOKED, HARROWED AND HARVESTED.

Jack Frost always goes cross-lots.

The best farm is the one that is best tilled.

Piety iz like Beans, it seems to do the best on poor sile.

There is lots of folks who can't let bad enough alone.

Every dime's worth of paint saves a dollar's worth of wood.

Show me a tidy farm and I'll show you a successful farmer.

'Steard of praying for rain, why don't the parson ask for a full crop in the barns?

Contentment wuz a fair maid, but did not bear increase until she wedded with Hope.

Going to law iz like skinning a new milk cow for her hide and giving the beef tew the lawyers.

This is the race track
Rounded and smoothed with care,
Thronged with horses and people
Every day of the fair.

These are the farmers' products,
Few and far between,
Viewed by reporters and committeemen,
Cared for by farmers green.

—Stoughton Sentinel.

Our Book Table.

Trumbull County, Ohio, Horticultural Society. Annual report of the proceedings of this vigorous and prosperous society. James Wilson, Jr., president; E. W. Turner, Newton Falls, secretary.

The Goldfish and its Culture, by Hugo Mulert, Cincinnati, O. This elegant book of over 100 pages, profusely illustrated, presents all the important and essential points concerning the treatment and best methods of propagating goldfish; its history; construction of fish ponds and aquaria; enemies and diseases of the fish, and other useful information pertaining to fish culture.

New Jersey Board of Agriculture. Twelfth Annual Report; P. T. Quinn, secretary. An extraordinary rich and varied amount of useful information is herein presented to the reader. During one of the discussions Mr. Schoonmaker, a Long Island farmer, made the astonishing statement that the use of concentrated special fertilizers had driven yard manures out of the market, and that farmers found it to their advantage to sell the manure made on their farms and buy special fertilizers instead. Prof. Cook had visited their farms and vouched for the correctness of the statements made.

The Bee-Keeper's Guide, by Prof. A. J. Cook, Lansing, Mich. The science and art of modern bee-keeping has been brought to such a state of exactness and perfection that those possessed of the necessary qualifications, if they will avail themselves of the excellent practical instructions and masterly teachings laid down in this book, can hardly fail to meet with success. Nothing directly or remotely connected with the keeping and management of bees is omitted or slighted in this work; it is perfect in every detail, and many parts of it are written in so fascinating a style as to infuse upon the reader an enthusiasm even into indifferent minds. As a teachers' Manual for the treatment of any applied natural science the work may justly serve as a model.

"INDUCING PHYSICIANS NOT TO PRESCRIBE ALCOHOLICS."

The above was the title of a paper read before the National Convention of the Women's Christian Temperance Union on November 2d, 1885, in Association Hall, Philadelphia. It may therefore please the members of that splendid organization to know of the great—the wonderful—success of a new treatment of disease which entirely supercedes the necessity of alcoholics. For sixteen years the "Compound Oxygen Treatment" of Drs. Starkey & Palen (who have more patients on their records than any other regular physicians of Philadelphia) has been used successfully in the cure of various forms of chronic maladies, and in no case has the use of alcoholics been a necessity. From every one of the States and Territories from which the delegates in that Convention came have come testimonials from patients to the wonderful effectiveness of this new remedy in curing them. And all were cured without the prescription of alcoholics! Some of them speak of the removal of a desire for stimulants, and in a few cases the entire release from bondage to morphine has been one of the results. The following-named persons are among those who report cures:

Mr. John Armstrong, of Lyons, Nebraska, aged 70, cured of dropsy; Rev. Charles F. Bird, Westworth, Nova Scotia, cured of nervous prostration after being disabled from preaching four years; Rev. John H. Chandler and wife, missionaries thirty-eight years in Slam, cured (after return) of malaria and nervous derangements; they are now living in Camden, N. J.; Mr. Alonzo Clark, of the firm of Davis, Collamore & Co., of New York city, cured of inflammation of lungs, after given up by physicians to die; Rev. Charles W. Cushing, D. D., editor of the *American Reformer*, New York, cured of nervous prostration; Mrs. Mary A. Doughty, of Jamaica, Long Island, cured of nervousness and sleeplessness and dyspepsia; Mr. George W. Edwards, St. George's Hotel, Philadelphia, cured of Bright's disease; Mr. F. A. Fielden, of Salem, Mass., cured of nervous prostration; Judge Flanders, of New York city, cured of dyspepsia and nervous prostration; Mr. Martin Hancock, Lake City, Florida, cured of dyspepsia and catarrh; Hon. William D. Kelley, of Philadelphia, cured of hereditary catarrh; Mrs. Mary A. Livermore, the celebrated lecturer, restored to "nearly uninterrupted perfect health and vigor after breaking down from overwork;" her address is Melrose, Mass.; Rev. George C. Needham, evangelist, and wife, send letters giving testimony of advantages resulting from treatment used by their friends and acquaintances; Hon. William Penn Nixon, of *Inter-Ocean*, Chicago, Ill., cured of disease of lungs; Frank Siddall, of Philadelphia, cured of nervous and physical prostration; W. H. Whiteley, Philadelphia, cured of sciatica and nerve prostration. We have printed statements from each of the foregoing, which will be sent to any address on application.

Rev. Edward J. Fisher, pastor of a Presbyterian church at Bristol, Morgan County, Ohio, writes:

"A Treatment cured me entirely of a severe attack of pneumonia, and I used only two-thirds. The remainder cured a neighbor of pneumonia in its last stages."

Rev. Anthony Atwood, a widely known superannuated Methodist clergyman, of the Philadelphia Conference, at the age of eighty-four, writes: "A swallow of the Oxygenicum will stop the irritation. So much it has done for an old man. A young man might be cured permanently. I recommend Compound Oxygen to all who suffer from throat diseases."

Rev. A. W. Moore, editor of the *Centenary*, Burlington, S. C., says: "I feel more life—more vigor—than I have for years. I believe Compound Oxygen a blessed, providential discovery."

Rev. Cyrus Hamlin, D. D., LL. D., President of Middlebury College, Vermont, writes: "I derived so much benefit from your Compound Oxygen Treatment, last year, that I will ask you to send me the same supply for home treatment, with the Inhaler, for which I enclose price. By my advice others have tried it, and never without benefit."

In the use of the Compound Oxygen the patient takes Nature's simple plan and follows it. Let us see what that plan is:

When the life-blood has made the circuit of the arteries and veins—before re-entering the heart—to be stirred on its circuit anew—it spreads over

the surface of the air-cells of the lungs, a surface greater in area than the entire exterior covering of the body. Here the air inhaled by the lungs meets it, changing its color to crimson, and imparting to it new vitality. *Here kindly Nature has been ever a Healer and Repairer*; here modern science finds the proper place to help Nature in the most effective way. Taking the fact that the usual proportions of the mixture of the elements of the atmosphere are the proportions exactly adapted to the needs of the average man in health, and seeing that an extra effort is needed for the sick to repair the waste of vital force in the blood, a different proportion is made in a mixture of the atmospheric elements—a lesser quantity of Nitrogen is put with a larger portion of Oxygen. When this "Compound Oxygen" is used, the blood enters the heart with increased vitality. That organ receives a portion of that vitality from the blood in its passage, and sends it forth with more force and less wear to itself; the vital currents leave on their circuit new deposits of vital force in every cell of tissue over which they pass, and return again to the lungs for a new supply. This simple story is the rational explanation of the greatest advance that medical science has yet made.

"The Compound Oxygen Treatment," which Drs. Starkey & Palen, 1529 Arch St., Philadelphia, have been using for the last sixteen years, is a scientific adjustment of the elements of Oxygen and Nitrogen magnetized, and the compound is so condensed and made portable that it is carried by express to every portion of the country—in deed, it is sent all over the world.—*Adv.*

BUYING SEEDS requires greater confidence in the integrity of the seller than any other article of merchandise. Perhaps no grower or dealer in America is more rapidly gaining the confidence of the public for strict reliability than is Mr. Tillinghast with his "Puget Sound" brand of Cabbage Seeds. He has customers who plant out 25 to 50 pounds of seeds, the product, aggregating hundreds of thousands of dollars, being at stake. Any grower desiring home-proof that these seeds are the best, will be referred to persons in his own State who have fully tested them, by addressing Isaac F. Tillinghast, La Plume, Lackawanna Co., Pa.—*Adv.*

THE HELPING HAND.

This department of THE PHILADELPHIA WEEKLY PRESS is devoted exclusively to information and open discussion of subjects of interest to women, and covers the entire field of practical household work, home culture and entertainment. It is attracting much attention. In connection with this department THE PRESS offers the magnificent book, "Great Truths by Great Authors," the book and THE WEEKLY PRESS for one year being sent for \$1.75. The publishers' price of the book alone is \$2.00.

Send for premium list.—*Adv.*

A NEW METHOD OF FARMING AND GARDENING.

The Hon. A. N. Cole of Wellsville, N. Y., has discovered a system of sub-surface drainage and irrigation by which crops are said to be wonderfully increased—estimated at five-fold or more. His discoveries have been embodied in a handsomely illustrated book which has been published by THE ANGLERS' PUBLISHING CO., 252 Broadway, New York.—*Adv.*

A GREAT OFFER.

Recognizing the superior excellence of the St. Louis *Magazine* we have arranged to furnish it in connection with THE AMERICAN GARDEN at the low price of \$1.75 a year for both publications, the *Magazine*, under its enlarged and improved condition, being \$1.50 a year alone. Those wishing to see a sample copy of the *Magazine* and a set of gold picture cards, before subscribing should send 10 cents to St. Louis *Magazine*, 213 North Eighth street, St. Louis, Mo., or send \$1.75 net to THE AMERICAN GARDEN.—*Adv.*

GOOD WATER.

The Waukesha Glens water advertised in this issue is one of the very finest of all inland waters, and is just becoming known as a specific for many diseases of the stomach and bowels. It seems like "carrying coals to Newcastle" to bring spring water from the West to the East, but the Waukesha Glens is gaining many converts to its virtues in all sections.—*Adv.*

COLGATE & CO'S
CASHMERE BOUQUET PERFUME.

This is one of the richest, most lasting, and refined of all handkerchief perfumes. The name and trade-mark of

on every bottle assure purchasers of superior and uniform quality.

Does Newspaper Advertising Pay?

From
N. W. Ayer & Son
Philadelphia

A PROMINENT SEEDSMAN, now a large advertiser, when giving his first order for Newspaper Advertising, remarked to the writer: "It seems supremely ridiculous, that after spending several thousand dollars in the preparation of a beautiful catalogue, we should have to spend as much more to induce people to ask us to give it to them." He, however, concluded that it paid, and kept at it. If you have any serious doubts on the subject, don't ask us—of course we would say *yes*—but ask *The Dingee & Conard Co.*; *Peter Henderson*; *Hiram Sibley & Co.*; *L. W. Goodell*; *D. M. Ferry & Co.*; *Ellis Bros.*; *Jno. S. Collins*; *Price & Knickerbocker*; *T. S. Hubbard*; *W. & T. Smith*; *Chas. T. Starr*; *W. Atlee Burpee & Co.*; *David Landreth & Sons*; *Jas. F. Le Clare*; *Robt. Buist, Jr.*; *Henry A. Dreer*; *Hoopes Bros. & Thomas*; *Niagara White Grape Co.*, and dozens of others who have been doing it in a greater or less degree for years. If, however, you decide to spend any money in Newspaper Advertising, then you want to talk with us. Most of the above named parties do their advertising with us (we are sorry the others do not), they can tell you how we do business. For many years we have made Newspaper Advertising our close and constant study—we confine our attention exclusively to this branch of business, and are prepared to place any American newspaper advertising economically, promptly and satisfactorily. We have no specialties to urge upon an advertiser, but give thoughtful, unprejudiced advice regarding selection of papers best adapted to accomplish the desired purpose. Our record speaks for itself—we cannot change it. The total of our first year's (1869) business was \$15,000; clerks were unnecessary accessories, and a room 18x20 then answered all our requirements. To-day we occupy for business purposes more than 10,000 square feet of floor room; our pay-roll includes the names of over ninety employees, and the aggregate of the charges on our books for the year ending December 31st, 1884, was \$922,479.87; this amount including no advance orders or business which had not been actually placed within the year. We believe it is universally conceded that we do very much the largest business in our line in the world, and it has not come to us by accident. Is it not fair to assume that the largest amount of business secures the lowest prices? The experience of our customers seems to justify this assumption, and many of them have come to us after extended dealing with other advertising houses. Of the following points all who are interested in such a business as ours should certainly interest those who advertise, or any about to commence in that line. An investigation of the details of such a business as ours should therefore extend the invitation to all who spend any money in newspaper advertising to call and see us, or drop us a line.

N. W. AYER & SON,
Newspaper Advertising Agents, PHILADELPHIA.

ARTHUR'S ILLUSTRATED Home Magazine

For choice reading, beauty of illustration, and typography, has no rival.

The HOME MAGAZINE aims to be that particular periodical indicated by its name. To the homes and firesides of the people it enters as an intimate friend, and furnishes to all within the precincts of home agreeable diversion in a literary form, free from impurity, and designed to encourage and stimulate the practice of the domestic virtues and high probity in all the affairs of life.

In addition to the General Literary Department many pages are devoted to home decorations and household affairs.

Terms: \$2.00 per year. Write for FREE SPECIMEN COPY and club rates.

T. S. ARTHUR & SON,
Philadelphia, Pa.

AGENTS WANTED. AGENTS WANTED. THE AMERICAN ANGLER.

A weekly journal devoted exclusively to FISH, FISHING and FISH CULTURE: Practical Essays on Angling and Anglers' Implements, and Reports of Fishing from all parts of the United States and Canada. Seth Green, the eminent fish culturist, has charge of the Fish Culture Department. Published weekly, at \$3.00 per annum.

AGENTS WANTED. AGENTS WANTED. "THE NEW AGRICULTURE."

BY HON. A. N. COLE.

A Startling and Valuable Book

FOR
FARMERS AND MARKET GARDENERS.
FULLY ILLUSTRATED.
TROUT STREAMS MADE AT WILL.

Handsome bound in cloth and gold. Price \$2.00. After many years of patient labor and investigation into the fundamental laws governing the movements of the waters upon and beneath the soil, Mr. Cole has discovered a system of subsurface drainage and irrigation, by which the most wonderful results have been produced.

He aptly calls it "The New Agriculture." Concisely stated Mr. Cole's system has the following advantages as compared with the methods of agriculture now in general use:

- 1st. Cereal crops are increased more than four fold.
- 2d. The size, flavor and enhanced production of fruits and vegetables are in proportion as five to one under the old systems.
- 3d. Vegetation of all kinds is rendered absolutely free from diseases, more especially from that arising from fungoid infection.
- 4th. The ground worked under this new system being measurably impervious to frost, the producing season is prolonged from forty to sixty days.
- 5th. It creates a rich, moist and loamy soil out of the most unpromising hardpan.
- 6th. It prevents the washing of surface soils from hillside farms during heavy rains.
- 7th. Drought is effectually provided against.

"The New Agriculture" is endorsed and commended by the Farmers' Clubs of Elmira, N. Y., and of Allegany County, N. Y.; by the Hon. John S. Burnham, ex-Mayor of Albany and present member of Congress; by Prof. J. P. Roberts, of the University farm at Cornell, N. Y.; by Hon. Wm. M. White, President of the New York Agricultural Society; by Prof. C. R. Earley, of Philadelphia, Pa., and a number of other prominent agricultural authorities. Liberal terms to agents. Address THE ANGLERS' PUBLISHING CO., 252 Broadway, N. Y.

NEW TRADE.

It is well known that dealers in Agricultural Implements handle large quantities of seeds and garden tools. If you wish to reach 7000 Implement and Hardware dealers per month, advertise in the "Farm Implement News." This paper is the only one that circulates exclusively among Implement Dealers. We believe it would pay every Seedsman to correspond with us. Sample copies Free. Address, mentioning the "American Garden,"

THE FARM IMPLEMENT NEWS,
95 Fifth Ave., Chicago, Ill.

and \$2.00

Headquarters

FOR ENGINES.

UPRIGHT STEAM ENGINE!

Height from Base to top of Smoke-Stack, . . . 8 inches
Height of Boiler, 3 inches
Diameter of Boiler, 2 3/4 inches
Capacity of Boiler, 58 liquid pint or 17.2 cubic inches
Area of Piston, 159 square inches
Length of Stroke, 1 1/2 inches
Diameter of Fly-Wheel, 1 5/8 inches
Diameter of Pulley, 5-8 inches

The new Wheeden Upright Steam Engine, a correct illustration (in reduced size) of which we show above, is the most complete and useful engine for running small machinery ever invented. It is brass boiler, has safety valve, stop valve, whistle, smokestack, &c., all lathe turned and as nice work as is put on our \$2.00 engines. It is perfectly safe and the smallest child cannot in any way injure themselves with it. Every boy in America should possess one of these engines. Fathers and Mothers! do you know of any thing better for a holiday present than this engine which will furnish the children hours of amusement and instruction? To introduce them, we will send this Engine Postpaid for only \$2.00 Each Engine is packed in sawdust in a sealed case, and will reach its destination in perfect order. Full directions sent with each.

SMALLER SIZES—We have Smaller Sized Engines that we will warrant in every way, which we will send by mail postpaid, at the following prices:
No. 391 Double Boiler Horizontal Engine, \$1.50
No. 2 Seamless Boiler, 1.00
No. 300 Upright Engine,75
No. 200 Small Upright,50
All of the above have brass boilers and are absolutely safe. Send Stamps, Money Orders, Postal Notes or Currency. Address: CONN. MANUFACTURING CO., Hartford, Conn.

A BEAUTIFUL HOUSE FOR \$1200

This marvelous house has been built more than 3000 times from our plans; it is so well planned that it affords more room even for a large family. 1st floor shows plenty of closets, 4 bed rooms and in attic 2 more. Large illustrations and full description of the above as well as of 30 other houses, ranging in cost from \$400 up to \$3,500, may be found in "SUGGESTIONS IN MODERN LOW-COST HOUSES," a large quarto pamphlet, showing also how to select sites, get loans, &c. Sent postpaid on receipt of 5c. Stamps taken, or send \$1 bill and we will return the pamphlet. Address: BUILDING PLAN ASSOCIATION, (Mention this Paper,) 24 Beckman St., (Box 2702,) N. Y.

A PRIZE.

Send six cents for postage, and receive free, a costly box of goods which will help all, of either sex, to more money right away than anything else in this world. Fortunes await the workers absolutely sure. Terms mailed free. TRUB & CO., Augusta, Mo.

Established 1874.
Johnston's Journal.

AN ILLUSTRATED MAGAZINE FOR THE PEOPLE.

36 pages. Bi-weekly. \$2 a year; 10c. a copy.

JOHNSTON'S JOURNAL aims to combine RECREATION AND AMUSEMENT with INSTRUCTION and INFORMATION—that is to say, while the articles are short, bright and readable, they are of an "informational" character. They are also ORIGINAL, and to the point, covering every matter of current general interest, and are HANDSOMELY and COPIOUSLY ILLUSTRATED.

The magazine holds a UNIQUE position in the world of POPULAR LITERATURE. There is no other peer to it, either in America or Europe. It appeals to Everybody, and possesses in a marked degree the requisites to render it the general favorite it is—STELLING MERIT, HIGH CHARACTER, POPULARNESS AND CHEAPNESS.

It has several advantages over the best of the monthlies. It is ISSUED OFTEN, costs the reader or LESS, and its articles are SHORTER, MORE timely, and of MORE GENERAL INTEREST. It also gives quality in proportion to the price, while the quality of its contents is up to their HIGHEST STANDARD OF EXCELLENCE.

Sample Press Opinions.—"Eminently Readable." "Bright, interesting and instructive." "Its illustrations are real works of art." "A bright, well edited publication, full of the best kind of reading." "One of the brightest and best literary productions we have ever examined." "A magazine for the Home and the Family—pure, wholesome and elevating."

JOHNSTON'S JOURNAL may be ordered of NEWS-DEALERS EVERYWHERE, at the slight expense of 10 cents EVERY OTHER WEEK. The Christmas number is UNUSUALLY handsome and interesting, and a powerful new story commences Jan. 9, 1886.

Order these two numbers of your newsdealer (or send 20 cents for them to the Publication Office), or remit \$2 for one year's subscription. Postage in U. S. or Canada PREPAID. Any dealer or postmaster will take subscriptions; or address,

W. J. JOHNSTON, Publisher,

WEBSTER'S PRACTICAL

Probably all of our readers have occasion to use a dictionary every day. In some cases words cannot be correctly spelled; in others, the pronunciation is difficult; while in still other cases the meaning is not understood. This is true, not only of children and of the uneducated, but of many of the more intelligent as well; and every one who attempts to do without Webster's Practical Dictionary attempts to do without one-half of his opportunities for intellectual improvement.
 Webster's Practical is an entirely new work by the editors and publishers of Webster's Unabridged and contains more than twice the amount of matter and illustrations ever before offered for the price.

Horse.
 1, ears; 2, forelock; 3, forehead; 4, eye; 5, eye-pit; 6, nose; 7, nostril; 8, point of nose; 9, lip; 10, under jaw; 11, cheek; 12, poll; 13, mane; 14, withers; 15, parotid gland; 16, throat; 17, neck; 18, scapular point; 19, shoulder; 20, chest; 21, ribs; 22, back; 23, loins; 24, hip; 25, flank; 26, belly; 27, haunch; 28, thigh; 29, buttock; 30, side; 31, leg; 32, tail; 33, hock; 34, cannon or shank-bone; 35, arm; 36, knee; 37, passage for the girths; 38, elbow; 39, shank; 40, bullet; 41, pastern; 42, coronet; 43, foot; 44, hoof; 45, fetlock.

It also embodies several entirely new features which render it pre-eminent to such a degree that for general reference in every household, it will not pay to use even the best of the older works any more than it would pay to journey across the continent in a lumbering old stage-coach while the numerous advantages of a lightning express are available.

The price is only \$1.00, but by arrangement with the sole agent, S. S. Wood, 130 1/2 West 33d St., New York, we are enabled to make this remarkable offer.

It will be sent with THE AMERICAN GARDEN, for only \$1.35 (add 10 cts. for postage). Send orders only to the publisher of THE AMERICAN GARDEN.

Nearly 1,000 First-Class Illustrations in Webster's Practical.

USE THE ONLY PURE WAUKESHA WATER.

WAUKESHA GLENN,

"QUEEN OF WATERS."

HIGHEST AWARDS OVER ALL OTHER WATERS, NATURAL OR ARTIFICIAL, AS A CURE FOR TROUBLES OF THE LIVER, KIDNEYS, BLADDER, ETC.

"PURE WATER is only to be obtained from NATURAL SOURCES."—Vide Lancet, July 7, 1853.

The dangerous qualities of contaminated drinking water are not obviated by the addition of wines or spirits.—Medical officer Privy Council, England.

Pure water is even more important than pure milk.—New York Herald.

The drink of the future.—Mooly.

Helped more than two years' skillful treatment.—Samuel Stevens.

I am a living advertisement for this excellent Water.—W. Wilson.

Cured of Bright's Disease.—W. Hathaway.

The best merits all praise.—Hon. Geo. H. Peabody.

May the Glenn Spring continue to run Pure Water for ever.
D. W. C. House.

"WAUKESHA GLENN" reigns alone among Natural Dietetic Table Waters. Its numerous competitors appear to have, one after another, fallen away until it has no rival.

With ladies, gentlemen, and *bon vivants* everywhere it has become the standard of dietary exponents, fortifying the digestive functions, and enabling free livers to indulge with impunity at the table. The world of wealth, intelligence and refinement testifies to its sparkling, naturally pure and delightful qualities, as the beverage incomparable, and accredits it with being the surest and speediest source of clear complexion, high health and exuberant spirits. Endorsed by the Medical fraternity. It has been tested by thousands, whose unsolicited testimonials are open to the public, and furnished to all who desire. **MAILED FREE.**

ADDRESS

T. H. BRYANT, WAUKESHA, WIS.
